(*Vide* question 6.) Answer. A large preponderance—perhaps 90 per cent.—of mining litigation has sprung up in cases of parties who were unable to define the line of direction of their lode and cover it with their title. The government law allows 600 feet as the end width of the line of the lode; the local laws and the State laws limit the end width of the lode to 300 feet in some counties; while in other counties they allow even less. An end width of 300 feet is equivalent to 150 feet on either side of the center of the lode. In Gilpin, Clear Creek, and Boulder Counties the end width of the lode is limited to 150 feet; that is, to 75 feet on each side. Park, Lake, and the southern counties of this State allow an end width of 300 feet; that is, 150 feet on each side.

(*Vide* question 7.) Answer. I have.

(*Vide* question 8.) Answer. I have.

(*Vide* question 9.) Answer. They are frequently; that is, the outcrops of the lodes, which are strictly essential portions of their respective lodes and are so considered by the law as defined in repeated decisions, are often more extensive in width than the limit which the law allows for a claim even if the extreme width of 600 feet be taken.

(*Vide* question 10.) Answer. They do.

(*Vide* question 11.) Answer. To their disadvantage; in more than a hundred instances to my personal knowledge. There is no mine which I value, to my knowledge, within the limits of the State of Colorado that has not been involved in litigation in consequence of that very circumstance, where adjacent lands were worthless for mineral purposes but could be made use of by a jumper to sink a shaft down to a lode already developed and then prevent its further development; the only remedy is a costly litigation.

(*Vide* question 11.) Cross-question. Have such instances occurred in this section?—Answer. Yes; more than ten times which I could name in this district.

Cross-question. Can you roughly state the amount of money which has been wasted in litigation growing out of this practice?—Answer. I should hardly venture to make even a rough estimate of the total amount. In my own case I may say that I have spent from fifty to seventy-five thousand dollars to protect our lands against jumpers who have located on lands too which have been proved again and again to be entirely worthless as mining lands. I mean that the lands were worthless except to a jumper who could use them to cut our vein of ore and thus secure a mining title.

(*Vide* question 12.) Answer. He can; and his position will be sustained in the local courts and also in the federal courts. The case mentioned has actually occurred several times in this State, and the decisions in favor of the subsequent locator have been rendered by the highest authority, the judges of the supreme court, Hallett and Miller.

(*Vide* question 13.) Answer. They are; it is—the pretense is—that the claim which you own is bounded within your patented side and end lines. The land about you being public domain is therefore open for occupation, and every citizen and every man who has declared his intention of becoming a citizen has a right to come outside of your side lines and sink a shaft. He cannot touch your lode, but he claims to have struck a parallel and overlapping one, and the determination of this point generally occasions a costly lawsuit.

**Cross-question.** Would it or would it not be wise, in your judgment, to exact of every locator affirmative proof that he has really struck a new lode? **Answer.** I would make him prove it by his own affidavit and by two disinterested witnesses who should show that he had made an actual discovery.

**Cross-question.** In other words, would you exact of every applicant proof sufficient to show that he had discovered actual mineral and did not seek merely a chance to blackmail his neighbor?

(*Fide* question 13.) **Answer.** Question 2 (cross). The man should make and prove an actual discovery within the meaning of the law.

**ADDENDA.**—(Answer by Mr. Robinson.) In my opinion, some responsible public officer should be the person to determine the accuracy of the applicant's claim. The certificate of such an officer is required by the old Spanish domain law. We want an officer whom the government can hold responsible to make the examination and report.

(*Fide* question 14.) **Answer.** It is scarcely possible; locators can scarcely do so without provoking litigation.

**Cross-question.** Could you suggest a practical form in which this provision might be retained? **Answer.** Such a form might be devised, but I do not believe that the people in the mineral regions would ever understand it and abide by it; it would be a failure in so far as stopping litigation is concerned.

(**NOTE 1.**) Mr. Stevens said: "I am clearly of the opinion that Congress has delegated powers to the Territorial and State legislatures which they should never have been allowed to exercise. By reason of this delegated authority, these legislatures have been able to interfere constantly with the disposition of the public domain. In my opinion, Congress should enact such laws as would enable it to resume full control of the public domain."

(**NOTE 2.**) Mr. Stevens said in relation to the status of the mining laws in the States lying to the west and northwest of the great lakes: "In Michigan only one case has been carried to the Supreme Court in the past twenty-five years where the question of title to mining lands was raised. This was a contest between the Minnesota and the National Mining Companies. The National Company held their title from a grant made by the State of Michigan under the provisions of the school act. The Minnesota Company derived their title under an old land law permitting location and pre-emption by authority of the War Department. (This law was passed on the 3d of March, 1843.) The Supreme Court ruled that the school land was held by the State of Michigan. The action of the War Department in leasing the land to the Minnesota Mining Company was held to be legal by the Attorney-General in his written opinion. At the time that the land grant of the school sections was made by the State of Michigan to the National Mining Company the government held that the grant made by the State under their title to every sixteenth section of land was valid. The Minnesota Mining Company claimed that portion of the school section land which they had pre-empted and surveyed under the grant made by the War Department. The government mineral lands were pre-empted or leased under surveys made by Allison. Judge Burt was appointed to carry the meridian lines through the disputed district. Then a law was passed declaring that the lands nearest the subdivisions should be considered as the lands which were sold by the War Department to the Minnesota Mining Company. Where the lines as surveyed by Allison differed from the later survey lines the holders of the land were allowed to adjust them to the subdivision lines."

**NOTE.**—**ADDENDA.**—"The operation of the mineral land laws in Michigan was substantially the same as their operation in Wisconsin, Minnesota, Illinois; in fact, in all the northwestern States lying near the great lakes."

**Question A.** What is the average expense of procuring a title to a lot?—**Answer.** We seldom get a lot for less than \$150. Under existing laws, however, I should not recommend any effort to reduce the expense of procuring a title to a lot. It is one of our imperfect safeguards against jumpers who annoy us by taking possession of neighboring lots. If the lot next our productive one is barren, the jumper must pay a considerable sum for a worthless plot of ground, with the chance also of being worsted in his litigation for our productive lode. I would, therefore, increase the price of lots to obviate the chance somewhat that a worthless lot may be taken on speculation.

**NOTE.**—In regard to amendments of existing legislation, Mr. Stevens said: "I would recommend that all surveys in future should be made by the United States Government, in accordance with their recognized system of establishing meridians and base lines, and then that rectangular lots should be laid off. I would limit all sales of government lands in future to lands whose boundaries have been accurately determined by government surveys."

**NOTE.**—(Question to be added.) "What resource is there for a mine-holder except forcible resistance, if a jumper obtains part possession of his land by fraud and the unjust operation of the local mining laws?"

*Testimony of Eugene K. Stenson, practical surveyor, Denver, Colo.*

**EUGENE K. STENSON**, practical surveyor, testified at Pueblo, Colo., August 29, 1879:

Reside at Denver, Colo. I have had contracts under the surveyor-general of Colorado for surveying the public lands. I think the present rectangular system of surveying the public lands good, and it should be retained. Its simplicity recommends it to all. The present methods of executing the surveys are inaccurate. This results from the employment of incompetent people, and careless and injudicious acts on the part of competent people. I think that a stone monument at the intersection of, say, four townships, when the ground is hard, or a metal or other lasting stake at the same place where the ground is soft, would be the best method to perpetuate the survey, or the New York method of "pots and charcoal," or to tie these monuments to some natural fixed object. I have frequently made surveys for private parties, settlers on the plains. I have found most all the stakes and posts gone, and have been compelled to take the field-notes of the surveyor-general and relocate the tract and place new corners. The present price per mile for surveying the prairie townships is now too low. The government at present pays \$10 per mile for mountains and \$6 for prairie or subdivision lines. A surveyor in the field has his party on hand and so hurries through his work and slouches it, so as to make money out of the contract. I have had experience in surveying mineral lands, and I think a square location with end and side lines should be adopted.

One-half of the deputy United States mineral surveyors don't know how to use the instruments requisite to do this work correctly. The present method of appointment of deputy United States mineral surveyors is bad. At present a person desiring to have such an appointment gets the recommendation of three or four prominent politicians and then is appointed. No particular attention is paid to his qualifications. I was on the surveys for both roads, the Atchison, Topeka and Santa Fé Railroad and Denver and Rio Grande Railroad surveys of the Grand Cañon of the Arkansas in this land district, where the Denver and Rio Grande ran a line through the cañon to the exclusion of all other corporations. My judgment is that no single railroad company should have the right to solely occupy such a natural pass. It should be common to all, or if only room for one, then all should use the track with compensation for the use to the company building it. The present law that when a deputy surveyor makes a mistake in the location of a corner that it is final and shall stand, even though an error, should be repealed and the surveyor-general have the right to order its correction. I recall an error of a deputy in surveying a township; in chaining made an error of 700 feet in one mile.

*Testimony of James B. Thompson, special agent Interior Department, Leadville, Colo.*

**JAMES B. THOMPSON**, special agent Interior Department on timber depredations, testifies:

I reside in Denver, and have been a resident of Colorado for ten years. I am special agent of the General Land Office, and my duties are to investigate and report upon timber depredations on the public lands, and have acted as such since June 26, 1879.

In answer to the inquiry what depredations I have observed in this locality I have to state that a very large proportion of the timber of this vicinity has already been cut in violation of law, and the destruction of timber is very rapidly progressing. There are seventeen saw-mills at work, which will cut 5,000 feet on an average for each mill daily. There are fourteen smelting works, which consume charcoal made in the vicinity to the extent of nearly 40,000 bushels daily, equivalent to 1,200 cords of wood. I think that about 300 men are engaged in supplying charcoal, and these employ probably more than 2,000 choppers, haulers, and burners. The smelters co-operate with the charcoal men, and often build kilns for them. Large quantities of timber are also taken for timbering mines, the amount of which is extremely difficult to estimate.

Not only is timber taken for the necessary purposes of mining and building, but there is no doubt much waste. Fire is in some cases purposely set to the forests in order to kill the standing timber. Wood which is dead though still sound is considered best for making charcoal, and killing the trees by fire is believed to bring the wood into the best condition for charring. In other cases, young trees are selected as yielding better charcoal than older ones, while the older trees are taken for lumber. In cutting trees, therefore, the whole tract is denuded and left bare. Large quantities of timber are cut down and left lying on the ground.

The difficulty arises from the fact that there is no lawful way in which a person can acquire title to timber-land, be protected in his rights, and have a personal interest in preserving timber and using it economically. There is no doubt that if persons could

acquire such titles they would gladly do so, and pay a fair price for the land. All the land in this vicinity, with the exception of small tracts along the Arkansas, has been declared mineral land, and can be acquired only as such. I have reason to believe that numerous tracts have been taken up, both as placer and lode claims, for the purpose of securing the timber on them. They have merely been filed upon without the intention of perfecting titles, but merely to hold them long enough to strip off the timber. None of the *bona-fide* mining companies have ever done this to my knowledge. Where a number of them have consolidated they have merely claimed the right to hold the timber for their own purposes.

In answer to the inquiry about destruction by fire, I may say that they originate in many ways. I think that most of them originate from carelessness in leaving camp-fires in the morning. The wind rising toward midday scatters the embers and sets fire to thousands of acres. In some portions of the State Indians set fire to the forests, partly to drive game, partly to destroy the old dead grass and give the young grass a better chance to grow. I have been a frequent witness of this, and also a sufferer by it. Under the State laws Indians are liable to punishment for setting fires the same as whites.

The effects upon the general welfare of the country I conceive to be mainly of two kinds. In the first place, the destruction of forests is proceeding far more rapidly than their restoration by growth. The amount of standing timber in the State has largely and very visibly decreased during the last ten years, and before many years have passed the State will be disforested unless the present tendency is checked. The second effect is very serious. The great accumulations of snow, which by its melting feeds the streams, are at those altitudes where timber grows most abundantly. During the early summer the forests by their shade retard the melting of the snow, and the streams are fed gradually and slowly and usually keep up a good flow of water throughout the summer. Where the forests are stripped off or burned the snow rapidly melts in early summer, the water runs off in large volume, and then the streams dry up. Streams which now yield a good body of water for irrigation throughout the summer and pasturage in the lower altitudes would suddenly become dry or so much depleted as to be practically useless for irrigating purposes.

The forests are heavier usually upon the western mountain slopes than upon the eastern. The fires also are more destructive on the western slopes, partly because there is more wood to feed them and partly because of the prevalent west winds.

In answer to the inquiry what has been my experience and the results of my efforts in carrying out the instructions of the Interior Department, I may say that I have found the owners of saw-mills and timber-cutters very indifferent and regardless of the possible consequences of their depredations either to themselves or to the community. While they profess themselves desirous of acquiring rights to timber, they seem to look upon it at present as a kind of spoil sanctioned to them by local practice and have little fear of prosecution. They have apparently the conviction that even if prosecuted they will not be convicted, because the local sentiment is entirely favorable to them and no jury would convict them. Personally I have nothing to complain of, having always received civil treatment and found them willing to discuss the subject. But they evidently feel secure against any legal consequences and rather despise the law; They argue, and justly, that timber is an absolute necessity, and it is undoubtedly true that the greater part of what has been taken has been put to the most necessary uses. In a word, the taking of this timber is regarded by them as one of those "necessities which know no law." They are undoubtedly sustained by public sentiment.

In presenting to these parties the terms of compromise which the Interior Department has offered I have met with little response. I have sent notices to about fifty different parties and have received acknowledgments from only four. The last one to acknowledge it was the most extensive depredator in the camp. He called upon me recently and stated that he would confer with others in the same occupation. If they agreed to compromise he would join with them, but if they determined to abide a law-suit he should do whatever they did.

I have not brought suit against any of these parties, partly because I have not felt authorized to do so, and partly because I think that no means should be omitted to induce these parties to accept the terms offered by the Interior Department. I think, however, that such acceptance begins to look almost hopeless and that a suit ought to be brought after waiting a reasonable time. Even if the suit fails it will have the advantage of showing the weakness of the law and its practical nullity.

In answer to the question what remedy I would suggest, it seems to me that some law should be passed enabling claimants to obtain directly from the government titles to forest or timber land in much the same manner as farms and placers are obtained, and solely for the timber upon it. In the mean time, pending the passage of such a law, it seems to me that the Secretary of the Interior should make a rule allowing the cutting of timber under the supervision of a proper officer, who should have the power to designate what trees should be cut, and to collect a stumpage tax for all trees taken. I think the general principle which should be recognized both in legislative and ex-

ecutive action is this: that the timber-cutters are willing to submit to reasonable limitations and restrictions in taking timber, and are also willing to pay for the privilege a reasonable price, but that any attempt to enforce a sweeping prohibition would be futile. It could not be done here without a large armed force. The rule of the Secretary for the protection of young trees is an excellent one in principle, but unfortunately it is overborne and rendered a nullity because the present system of which it is a part is defective as a whole, and it fails because the system fails. I think that the Secretary should issue the rule I have suggested at once, as the timber is disappearing in numerous localities at a very rapid rate.

In answer to the question whether it would be practicable for the government to enforce restrictions while allowing a limited use of timber, I would say yes. I think the people of the State are sufficiently intelligent to understand the necessity of such restrictions to the future welfare and prosperity of the State, and sufficiently law-abiding to submit to them if reasonable. I think that they will not be slow to understand the ruinous effect of disforestation of the country, or to understand that persons who take timber should have some show of authority for it, and should in equity be compelled to pay for the privilege and be protected in their privilege when they have paid for it.

In case timber lands were sold by the government the size of the tracts is perhaps a matter of no grave importance. If they could be sold those parties who wanted large lots would ultimately get them, however small might be the original parcels patented by the government.

I think that so long as the government owns timber land it should be under the supervision of government officers. I believe that this would be more satisfactory to the people than the absence of all supervision. As a rule I think people would rather get their timber honestly and in a lawful way from the responsible agents of the party which holds it than steal it. Such a supervising officer should have powers, and decided powers, to meet the want for timber on the one hand and to protect the rights of the government on the other. Such powers are not possessed by the present agents. At present the position of such an agent is merely that of a suppliant to men who whatever may be the extenuation, are both technically and really violators of law. The expense of such officers would be more than repaid to the government, for under their supervision the timber could be sold and bring revenue over and above their salaries, whereas at present the government loses its timber and gets nothing except abuse and defiance from depredators.

---

*Testimony of W. B. Vickers, private secretary executive department, Colorado.*

STATE OF COLORADO, EXECUTIVE DEPARTMENT,  
*Denver, September 19, 1899.*

*Public Land Commission:*

GENTLEMEN: Among the questions which you suggest to the citizens of Colorado are one or two which interest me, and upon which I have some "views" and a little information. Acting as secretary of the State board of land commissioners for some time past, I have been brought in contact with a number of our leading agriculturists and stockmen, and have been enabled to judge somewhat how they view the various plans proposed for disposing of the public lands of Colorado now lying waste by reason of aridity. Admitting for the most part that the general government ought to receive some income either from the sale or lease of its land in Colorado, I cannot see how any permanent benefit can be derived from any disposition of these lands other than the present system. It is true that thousands of acres now lie waste, except in the important sense that they furnish grazing ground for thousands of cattle and sheep, which are adding every year a large total to the taxable wealth of Colorado and the country. But this range is valuable only because it is open. It is because cattle and sheep can roam at will over these broad plains from north to south and from east to west that they can be raised and marketed with profit. To fence a range is to destroy its value, unless the tract inclosed is much larger than most stockmen could afford to fence, even if the land itself cost them nothing.

Perhaps this fact, even if admitted, is no argument in favor of furnishing stock growers a free pasture at the expense of the government, while agriculturists must buy the land they occupy; but what better can be done? The great plains are singularly valueless for any other purpose. Lack of water will prevent the reclamation of any considerable portion of them for the uses of husbandmen, but such portions as shall be reclaimed will, under the present system, eventually bring its value in the open market. The remainder might bring from 10 to 25 cents per acre if sold in unlimited quantities to cattle kings, who could buy up whole counties. But the smaller

operators could do nothing. Even the poor privilege of herding a few head of cattle or small flocks of sheep would be denied them.

To confine stock in a small inclosure, say 2,500 acres, is to invite destruction or compel winter feeding, which amounts to the same thing. No winter would ever pass without seeing the inclosed land covered deep with snow, and if the stock could not wander in search of grass elsewhere, it must be fed or die. If the water supply should fail within the inclosure, the result would be equivalent.

Under the existing law much of this land comes into market annually as a consequence of the demand for water privileges by small stockmen, and the quantity will increase until the valleys of all living streams will be taken up. Coupled with the sale of lands reclaimed for agriculture, this will constitute a revenue with which the government should be satisfied. The cash value of the arid lands of Colorado is infinitely less than that of the swamp lands ceded to the older States, and yet these arid lands are yielding a continual revenue, directly and indirectly. Unless the lands can be ceded to the State, I would suggest no change in the manner of their disposal.

Respectfully, your obedient servant,

W. B. VICKERS,  
*Private Secretary.*

---

*Testimony of A. S. Weston, attorney-at-law, Leadville, Colo., relative to mining laws.*

A. S. WESTON, practicing attorney, Leadville, Colo., testifies:

The mining law at present requires that the applicant, in person, shall make proof of the fact that the plat of the claim and notice of intention to apply have remained posted on the claim for sixty days, or practically seventy, ten publications in a newspaper being required. The applicant may live in New York or in San Francisco, so at immense expense he must appear at the district office to show the above. The law should be so amended as to permit this to be done by any competent witness. Two brothers, living here, located a claim. Neither one lived on the claim more than thirty days each, so neither was a competent witness to the sixty days' posting above set out. They gave a quitclaim deed for their possessory right, and then one went to Australia and the other to Ireland. The purchasers from them were put to a heavy expense in getting the proof from abroad—depositions of facts above set out and local proof. Now, if a competent witness, cognizant of the posting of notice above set out, had been permitted to make this proof the intention and purpose of the law would have been fully carried out, and much vexatious delay and expense been prevented.

At present, in surveys of the public lands, the deputy surveyors, owing to lack of regulation on this point of law, return on the plats entirely too much land in this district as mineral. Pre-emption or homestead settlers have the burden of proof by the existing law put upon them to show its non-mineral character—this at great expense and trouble. The notice of "final proof" now required to be published, posted, and proved by law in homestead and pre-emption proving up should be at once abolished as unnecessary and useless. I knew a case where a claimant came twice with two witnesses, at great expense, more than one hundred miles to comply with this regulation.

---

*Testimony of F. D. Wight, Trinidad, Colo.*

TRINIDAD, COLO., September 6, 1879.

F. D. WIGHT made the following statement:

I am a sheep raiser in Las Animas County, Colorado. I own about 10,000 sheep, which I range in Colfax County, New Mexico. I indorse the statement of Mr. Beattie, with this exception: I think he can graze a larger number of sheep in fewer acres than I can. He states that it takes 30 acres of land to graze 10 sheep. I should estimate that if there was no stock of any kind but sheep on a township of this land, that you might keep 5,000 sheep one year on it, perhaps in very fair shape, winter and summer. I would hardly wish to be limited to the last amount.

Mr. BEATTIE. When I referred to 3 acres for each sheep, I meant that it would be the minimum amount.

Mr. WIGHT. Your range, too, is 55 miles from here on the Dry Cimarron, where the pasturage is better. I think the estimate made by Mr. Romero is remarkable. It would not apply in Colorado or Colfax County, New Mexico. I do not think the raising of sheep and cattle is entirely incompatible with each other. I do not quite agree with Mr. Jones about the sheep leaving a bad smell on the ground that is offensive to

cattle; a number of cattle come down on my sheep ranch. I do not understand that.

Mr. JONES. If there had been other water around they would not have come there. The water accounts for it.

Mr. WIGHT. I do not believe that 3,000 acres would amount to anything as a pasturage farm, and would not compare at all with 160 acres of agricultural land. I think you could support on good agricultural land a family of ten children easier than you could a family of one child on 3,000 acres of arid land. I would not accept of less than one-half a township as a homestead for making a living and supporting a family in preference to 160 acres of agricultural land, such as is given as a homestead in Illinois, Ohio, Iowa, &c., and even then if they were sheep I think they would have to be highly improved sheep that would shear 5 pounds of wool, and I do not think one-half of a township would support over 500 head of them. I do not think the net profit would be greater than could be realized from 160 acres of good agricultural land.

Mr. ARCHIBALD. As an illustration of the aridity of the country in which Messrs. Jones and Wight describe their ranch to be situated I will say that three men of the party of Mr. Deday, who was employed as deputy United States surveyor in running exterior lines in the eastern part of Las Animas County, got separated from the main party, and after wandering about on the prairie for three days in search of water two of them perished and their bodies were afterward found. The third man, who separated from the other two, narrowly escaped death. After wandering two whole days and part of the third day he found water 18 miles from the point where he separated from his two companions who perished. After wandering for two or three days more he found his party.

---

*Testimony of R. L. Wootten, Trinidad, Colo.*

TRINIDAD, COLO., August 30, 1879.

R. L. WOOTTEN, sheriff of Trinidad County, made the following statement:

I am a cattle owner in Las Animas County. I have heard what Mr. Beattie and others who preceded me said, and I fully concur with them. I think that there is no doubt that if this land was sold out to the cattle owners as people are able to buy it, it would tend to make this community permanent and quiet. I do not think this country is adapted at all to agricultural purposes. The wealth of the Territory lies in its stock.

There is a great deal of trouble on account of men going on one another's ranges by reason of overstocking. I have only a few cattle, but I should prefer to buy land for my cattle than to have other people come on my range. Then, too, if I owned the land I could have just the kind of cattle I liked. I purchased 10 head of bulls at a large price, but I found that my neighbors received more benefit from them than my cattle did. It is certainly to the interest of the country that these questions be settled as speedily as possible.

---

*Testimony of Carl Wulsten, Rosita, Custer County, Colorado.*

The questions to which the following answers are given will be found on sheet facing page 1:

ROSITA, CUSTER COUNTY, COLORADO, November 1879.

To the honorable the Public Land Commission, Washington, D. C., P. O. Box 585:

GENTLEMEN: Referring to your printed circular, I respectfully submit the following answers to your interrogatives.

CARL WULSTEN,  
Civil and Mining Engineer and United States  
Deputy Mining Land Surveyor

1. My name is Carl Wulsten, Rosita, Custer County, Colorado, civil and mining engineer, practical miner and mine owner, and United States deputy mining land surveyor.

2. Ten years by the 21st of March, 1880.

3. I have sought to acquire title to the Bunker Hill mine (official survey No. 63, mining district No 5) under the law of May 10, 1872; and I am seeking to acquire title also to the Lexington mine (official survey No. 76, mining district No. 5) under the same law.

4. None of any consequence.

5. I do not know, not having had any experiences.

6. Yes. I have seen men obtain title to agricultural lands by pre-emption who never lived upon the land. I know of parties having entered whole sections of land and obtained undisturbed titles thereto who never lived one day upon it, but most probably hired men to claim, file, and prove up, they furnishing the money to do so. I filed upon 160 acres of land, upon which I lived with my family, in 1870; filing was made in 1871, and another man filed right over me and upon the 40 acres upon which my home stood. I was too poor then to contest and had to give it up, and took a span of horses from him as a compensation for my improvements or get nothing. There is a hole in the law which is too easy for the wealthy and scarcely a protection for the poor settler. My idea is, that the proving up of actual residence ought to be made more stringent and more definite. Affidavits are had cheap, and the first filing ought to be made more evident as to actual possession and virtual rights in the premises. Proofs are not sufficient as they are required now. Rich corporations and individuals can now obtain far too easy parts of the public domain. Actual home and settlement ought to be the only condition of obtaining title.

7. The conformation of Custer County is mountainous, with high plateaus of grazing lands, well-watered meadow vales, and heavily timbered mountains. About one-tenth part is agricultural, three-tenths pastoral, and six-tenths timbered mineral lands.

8. Agricultural lands should be all such lands which are, first, under natural irrigation, by reference of its being below the water-courses of the mountains in level; in other words, lands which are moist enough for self-irrigation; secondly, all such mesa or bluff lands which can be irrigated by means of open irrigation ditches and not too high in its altitude above sea level as to be beyond the limits of the produce of small grains or tubers, altitudinally considered. Grazing lands ought to be considered all lands which cannot be irrigated at all, not being timber land. Timber lands ought to be considered all such lands which grow sufficient timber to be considered forests. Mineral lands ought to be considered all such lands showing transition rock, volcanic, or even plutonic formations.

9. The rectangular system of parceling surveys, as used by our government, is, in my opinion, the most practical and efficient of the world. Yet the execution of such parceling surveys is not perfect. The system of making the surveys of the public domain, by letting contracts for either surface boundaries of townships or for subdivision of such townships, is, in my estimation, wrong and the cause of an altogether imperfect result. The surveyors-general of the several States and Territories have the letting of all such survey contracts. It stands to reason that if such surveyors-general are not men of austere principles they will always have hordes of needy friends who want contracts. They may even make the letting of survey contracts a source of income themselves. It is beyond a doubt in my mind that every contract let up to date throughout the United States has been obtained through political favoritism. Politicians get these contracts for or in copartnership with land surveyors. The sureties are the partners in the contract, and the poor, needy surveyor goes out upon his contract and rushes it through in seven, eight, nine days, when twenty-one to thirty days ought to have been used for such contract; for the surveyor has to divide with his copartners or sureties, and may have to pay an assessment to even the surveyors-general. What is the consequence? The subdivisional survey is (if made *de facto* at all) made in a terrible hurry and not correct, not even *nearly* correct. I have surveyed all over this county for the last nine years. I have taken the official field-notes of townships and retraced the section, base, or range lines. In township 22 south, range 72 west (Silver Cliff), I have found but nine section corners of the interior section corners (not considering the surface boundary lines at all), and not found sixteen of them, and scarcely found any one-fourth corners at all. Now, this township was reported grazing land, when if the surveyor had made a *de-facto* survey he would have been able to find mineral in section 16 of the township. The utmost care shall be used by such surveyors, according to the instructions of the Interior Department, and so much "as to satisfy the utmost curiosity," referring to the existence of minerals, fossils, and natural curiosity. If this township 22 south, range 72 west, had been surveyed *de facto*, why the contracting surveyor would have found lots of natural curiosities in section 16, which has shown obsidian, agatized geodes, and many natural curiosities of such note as to attract even the utmost curiosity of the cowboys of the region; yet not a word of such natural curiosities, minerals, &c., appears in the official field-notes of Major Oake's contract of subdivisional survey of township 22 south, range 72 west. Why is that? I am satisfied that only those corners of this township were laid where the then just made settlement of Wet Mountain Valley might seek to build fences by and near Grape Creek. Why can I find section corners for sections 5, 6, 7, 8; for 7, 8, 17, 18; for 16, 17, 20, 21; for 17, 18, 19, 20; for 19, 20, 30, 29; for 20, 21, 28, 29; for 30, 29, 31, 32; for 28, 29, 32, 33; for 28, 27, 33, 34; and why not any others? But the township is arid lands, as reported, and the whole balance of the contract was made on paper and thus accepted. Such condition of affairs ought not to be. In other townships of this county I find miles to contain 83.58 chains, in-

stead of 80.58 chains as per official field-notes. This refers to the south base line of section 7, township 21 south, range 73 west of 105th principal meridian. On north base line of this section 7 I find 82.034 chains, instead of 79.20 chains as per official field-notes. Why? Because contractor never closed the last or west section run to west boundary, but just run to one-fourth, laid the same, and saved himself the other one-half miles runs. Why? Because he could not do it and exist. His contract money would not reach. He had probably to give one-half of the sum paid by the government to his copartner and surety, who obtained, through his influence with the surveyor-general, the contract, and who had probably even to pay a royalty on the obtainance to the surveyor-general. And thus I could state dozens of cases, which prove the system wrong and working detrimental to the interests of the government. My idea of the system as it ought to be adopted is: The General Land Office should have competent surveyors, who should only obtain their appointment after passing the necessary examinations in their profession for each land district, who should be salaried men and under supervision of expert superintendents, and who should only be employed for the survey of the public domain in its right-angular system, and the now existing contract system should be emphatically abolished once and forever. The competent surveyor, who has passed his government examination, should be retained in the services of the department so long as he fulfills his duties faithfully, or until his death. Thus a faithful servant is secured and the surveys of the public domains are made right and correctly. Even his surveying staff of assistants ought to be salaried men, and thus become perfectly drilled in their respective duties. These government surveyors should also be timber inspectors, whose duties it should be to watch over the preservation of the forests in their respective districts, thus insuring the preservation of our most valuable forests, making depredations upon the same almost impossible, having by means of his acquired local knowledge of his district also become perfectly acquainted with the quantity, locality, &c., of the forests, being able to at once note inroads upon the same, and enabling the prevention of destruction of them. The contracting surveyors of to-day have and take no interest in the township they survey. They rush through their contracts and vanish; do not care to report anything except their hastily constructed plats and field-notes, and do no good to the government.

#### AGRICULTURE.

1. The climate of Custer County is a generally moderate one. The mean temperature of May, June, July, and August, at noon of each day for eight years, was + 74 degrees Fahrenheit; of September, October, April, and March, at noon of each day for eight years, + 67.5 degrees Fahrenheit; of November, December, January, and February, at noon of each day for eight years, + 30.5 degrees Fahrenheit. (Rosita as point of observations.) The observations were made upon the south side of my house and open to the influences of the sun, but sheltered from the immediate sun rays. The hottest observation was + 91 degrees Fahrenheit, the coldest + 7 degrees Fahrenheit. The days are uniformly mild, the nights uniformly cold. The summer is dry, except during the rainy season from May to end of June and from end of July to end or middle of September. Generally the rains of May are gentle, those of July and August ferocious and emerging from terrible thunder storms. Up to December the weather is bracing and fine, when with the beginning of the new year snow storms are the rule. The average snowfalls are about 6 inches. The average moisture during the summer season is 14 inches. Custer County has but one-tenth of its area of farm lands, which are either self-irrigative or are easily irrigable by open canals.

2. Answered at 1. The most rainfall comes rather late for the crops generally; some seasons in May and June, and timely.

3. One-twentieth part of the tillable land proportion.

4. Nineteen-twentieths part of the tillable land proportion.

5. Wheat, rye, barley, oats, and potatoes.

6. Twelve cubic feet of water per minute, or 17,280 cubic feet in 24 hours, equal to 57.24 tons of water (at a velocity of 3 miles per hour), will duly irrigate 100 acres of land for wheat, oats, barley, and rye in this county; half of that amount is only necessary for potatoes.

7. Grape Creek and its tributaries in the west part of the county, Hardecrabble Creek and its tributaries in the east and northeast part.

8. The tillable subsoil of the agricultural region of this county is formed of porphyritic *débris* in the western portion of the county, and, being loose and porous, is barren if not irrigated by either rain or artificial irrigation. So soon as irrigation is resorted to it becomes very productive and strong in its results at germinative power. Irrigation does not injure the soil at all, but in every instance under my observation and experience increases fertility. On Hardecrabble the soil is made of granite and sandstone *débris*, and irrigation seems to act also very improvingly upon the soil. Wheat does ripen up to 7,500 feet; beyond that the seed has very little albumen and less starch and

will not make flour. This can also be said of rye, oats, and barley. Potatoes ripen here as high as 8,500 feet.

9. Two-thirds; two-sixteenths; one-sixteenth evaporation; voluntary generally, required by statute. (See Colorado laws.)

10. All taken up with homesteads or under pre-emption claims under the United States land laws.

11. No conflicts to my knowledge, except where some foolish men were determined to drown their crops, for fear their neighbors might receive some benefit from the water, which actually did their crops harm by overuse. Generally settled by an hour's vociferation and much gesticulation.

12. About one-thirtieth part of the county.

13. No. No man can pasture cattle, sheep, or horses except he has water, and that is taken up under pre-emption or homestead as 160 acres, and he pastures in the neighborhood of his water.

14. Yes. These lands should be limited to 160 acres.

15. Ten to fifteen acres. I do not know.

16. Ten head.

17. About 150 head.

18. It has held its own during the nine years of my residence here.

19. No. No.

20. No.

21. Springs and creeks.

22. Ten.

23. Diminished.

24. No. Cattle won't eat grass over which sheep have grazed.

25. Deadly feuds and killing of sheep by cattle men; but lately none of these quarrels have occurred.

26. About 4,000 to 5,000 sheep; about 120,000 head of cattle; sheep in herds of from 300 to 1,000. Cattle roam at large and are not herded, and are only rounded up every spring, calves branded, and unbranded cattle sold at auction, and thus the business is regulated.

27. I suggest to repeal the pre-emption law and only leave the homestead law in force.

28. Yes, in some townships there is very great trouble, as there are none to be found. I find but very, very few instances where corners are witnessed by blazed trees or rocks in place; I find no lines chopped through and blazes made to indicate where the lines have been run. I find very, very seldom the corners of such dimensions as the instructions to surveyors-general from the Commissioner of the General Land Office require; ditches and mounds I find almost none. Even township corners are not set according to these instructions, and the surveys are lamentably poor and incorrect and unconscientiously made. Cause, the contract system, in my estimation.

#### TIMBER.

1. One-half of the area of the county. It consists of pine, fir, larch, hemlock, scrub oak, aspen, cottonwood, pinon-pine, cedar, wild cherry, and willow.

2. None whatever.

3. By sale at \$2.50 per acre. And give a man 80 acres of timber if he will buy 80 acres of timber and clean it out and foster and cultivate it all properly. After five years, on proper evidence, give him a title to the 160 acres on paying \$200 for the whole. That man by using his 160 acres of timber properly will have almost a fortune in his 160 acres of such preserved and fostered timber land in this mining region. Further, if a mine owner applies for a patent to his 10.3-acre mining claim, give him the right to apply with it for 5 acres of timber land (non-mineral) as lot 3 to his mining claim (lot 1 being his mining claim, lot 2 being his mill site, and lot 3 his timber site for mining purposes), at \$2.50 per acre. Thus mine owners will foster their timber and try to preserve it for their mining purposes, and our forests will not be devastated.

4. No.

5. Yes; undergrowth of from 2 to 10 feet grows 8 inches per season of 12 months, but much becomes stunted from growing too close and smothering the more tender trees.

6. Carelessness of hunters and campers, of letting their camp-fires run out after leaving the place of the camp-fire. Indians, principally, who fire the forests to drive game out. Prevent the fires by hanging every man who can be proven to fire our forests. The people here have punished depredators, in several instances, severely. The extent of these fires has been alarming. This summer I estimate that at least 50 square miles of timber, valuable beyond estimation, has been scorched or totally destroyed by these fires in this county alone.

7. Pass a law that not a railroad tie can be cut from government land. The tie-cutters waste more timber than they use. We miners and our farmers are very careful of the

timber, as we know its value to ourselves. Prohibit all cutting of government timber, facilitate the purchase of timber lands as above stated, and have timber inspectors in every district to protect government timber.

8. They cut where they find timber they want. Whoever cuts a tree is the owner. If he does not take it away the next team loads it up and carries it off.

9. The United States district land office officials are generally too lazy to execute their office work. They would not raise a hand to protect the government's timber. Men of energy and action needed there, not political drones.

#### LODE CLAIMS.

1. I have had eleven years' experience in mining—in California 1849 to 1855; in Colorado 1873 to 1879—six years in mine surveying; none in mine litigation. I have surveyed over 500 location surveys, over 200 mine surveys, and some 18 official surveys for United States patents.

2. A mining (lode) claim, after being properly located, should be inviolable as to its surface boundaries. No man should be allowed to survey a cross or other claim over it. Make the surface boundaries of 1,500 by 300 feet inviolable. Give the miner the positive right to follow the dip of a vein, lode, or crevice, to the center of the earth for 1,500 feet. Make it peremptory that the right of location only begins at the actual discovery of a mineral-bearing vein in place, and give no man the location privilege if he has not discovered a *bona-fide* lode. Or abolish all this and give a man 10 acres of mineral land in a right-angular square piece of ground, and allow no other man to go inside of that square, but limit every man to ten such squares in every mining district, and make him discover mineral in paying quantities on one square before he is allowed to take up the second. Or make him put down a 50-foot shaft before he can take up another square of 10 acres of mineral land. Make him record the square at the date of his location, or thirty days, and make him put down four or eight stakes to define his boundaries, and keep him inside of his boundaries perpendicular. Make him prove up two years from location or abandon, paying \$5 per acre and proving \$500 worth of permanent improvements.

3. I would not allow the present official practice of filing surveys of lode claims which overlap on the surface. The Plata Verde lode claim (official survey No. 52 A), Hardscrabble mining district (mineral district No. 5), Custer County, Colorado, was a *bona-fide* location, made September 2, 1878, by William J. Robinson, surveyed and recorded. Rich mineral found and a mine worth millions uncovered. I made the official survey. The Ducktown claim was located before the location of the Plata Verde was made, but no earthly show of a speck of mineral ever was found in the hole, which they called the Ducktown, and which was in solid country rock of the commonest granite. The Ducktown was sunk 10 feet and no farther. The Plata Verde expended thousands of dollars upon development, applied for a United States patent, and at the last week of its ten weeks' advertisement is advertised by Ducktown on 1.27 acres of area in conflict. This is what I call an outrage, a blackmailing scheme of the worst kind. No; if the law was distinct in this instance this shameful practice would never prosper, and less litigations be possible.

4. Where the mineral-bearing crevice matter is first met, either on the surface or, as it blind lodes, underground, but wherever it is met, there begins the apex. No, not always. *Apices* are often shattered by slides, displaced by subsequent upheavals, or deranged by other causes, so that the dip or true course can only be ascertained by considerable sinking, drifting, and crosscutting. There should be a government mine inspector for every mining district, who should be arbiter in such cases of *apices*, &c.: whose duty it should be to see that mines are worked safely, and are not in dangerous condition to life and limb, and that they are properly ventilated, &c.

5. Yes. For a prospector has no business to locate his claim and stake his surface boundaries until he is certain of the general course of his vein, lode, or deposit.

6. No.

7. No.

8. ———

9. No. I never saw an outcrop of 300 feet yet. I do not believe there is one in existence anywhere.

10. No. Not if a man prospects the outcrop well, opens it out in several places first, before he finally locates his surface boundaries.

11. Yes. It should not be tolerated.

12. No. If A knows what he is doing and B is a just man. Scoundrels will do anything. No instance under my own experience.

13. No; not to my knowledge.

14. Yes; decidedly. I would follow my dip to China if I could without fear of trouble, provided I had a good and true vein.

15. Yes. Hardscrabble mining district at this place, by about twenty men, all miners but two, merchants. President and secretary to preside over deliberations and keep the minutes of the meetings. No books were kept. Records went to the County Clerk of Fremont County then.

16. All was done under the act of May 10, 1872.

17. Yes. If found erroneous, or if abandoned or vacant ground was to be added to previously located lode claims and other parts thereof were to be abandoned without detriment to other parties.

18. No.

19. Yes, decidedly; for all local records cannot be made better as if placed with the United States land officers. But a location record should in all cases be kept by the county clerk and ought and should be exact as regards the specific *locus* of the discovery made.

20. Yes, under all circumstances.

21. I have suggested my ideas. Ad. 2.

22. Yes. The limitation should be five years, not more.

#### PLACER CLAIMS.

1. Three-eighths of the whole area of county. The nature of our mineral deposits is volcanic. Veins, ledges, crevices, lodes hold the deposits. As this region has evidently suffered several volcanic eruptions, the surface of our fissure veins and lodes are displaced, altered, and so much disturbed as to appear to be mineral-bearing deposits of irregular surface character, but permanent and continuous developments will ultimately prove the appendages, apices, or surface residues of true fissures all over this region.

2. Yes; I see it working practically every day ever since 1872, and am almost hourly consulted upon some of its questions and merits. I have made most of the locations in this region, and now am intrusted with most of the official surveys. I have mentioned above my ideas in regard to overlapping, &c., which I hold to be necessary of alteration.

3. About three months and about \$250 by patent, without contest. Have not seen the workings yet with contest.

4. Have none.

5. Yes. Not exactly defective, but loose.

6. The placer claim ought not to exceed 10 acres, and no individual co-operation or corporate company ought to own more than ten acres. Give more people chances to develop the placer resources. Let companies buy from locators, but do not open too many doors for already rich people to gobble up all the country at once, because they are able to do so under the existing laws. The great maxim of our republican form of government, that of the people, to be "a government of the people," ought to guide our legislation in all its most minute details. Our enormous mineral resources should be principally for *the people*, not for *capital*. Capital is able, labor unable. Now regulate so as to ennoble labor without becoming subservient to the already almighty dollar. Give small lots to many and thus alleviate the *people* without injuring *capital*. The condition of placer claims to-day is such that any number of persons can gobble up a whole valley under the placer-claim section. They can easily insert wash gold in a hole and thus call it a placer ground and take up all the river bottoms, cañons, &c., for no other purposes but for its water-power and town-site purposes, the placer pretense being but the excuse. Make each locator of 10 acres of placer *prove* it to be continuous placer ground. Make him work it at least three months out of every year and prove such work, and make him prove up finally within three years of location for title.

7. I cannot give instances, but I know that valuable *non-mineral* lands have been located and titles obtained under the placer clause by men which were solely obtained for town-lot speculations.

8. No.

9. No.

Respectfully submitted by

CARL WULSTEN,  
*Civil and Mining Engineer, Miner, and Mine Owner,  
and United States Deputy Mining-Land Surveyor at Rosita and Silver Cliff.*

*Testimony of James C. Boyles, farmer and clerk of the district court in and for Hutchinson County, Dakota.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. James C. Boyles, a farmer, and clerk of the district court in and for Hutchinson County, Dakota.

2. Five years.

3. I am holding a homestead and timber claim.

4. I am clerk of the district court and have that advantage.

5. To contested claims it costs about \$20, and the time is sometimes over a year to get it canceled, and I think that in a contest case it should be canceled at once at the local land office, and thereby save delay, and let it be open for entry, say, in thirty days, if an appeal is not taken to the General Land Office in that time, and the contestant should have, say, fifteen days after canceling to file, and if he does not enter it in that time, it be open for entry by anybody. It would be a great saving of time, and cause these abandoned claims to be settled upon.

6. A party should have the same right to file before the clerk of the court that he has at the local land office, and not have to make actual settlement before he can file before the clerk. It would save a great deal of time and inconvenience. If they have a right to file before a clerk at all they should have the same they have at the land office; and there should be more stress upon the amount of improvements made upon a homestead, and not so much about the continuous residence. Say, for instance, a single man comes to the country and has no team and nothing to get one with; it is impossible for him to settle down on a piece of wild land, and having no team to work with, and make a living; but if he could leave his claim and work for some one to do some breaking for him and earn money to build a house with, and not be compelled to stay on the land all the time, he would have a chance to get himself a farm. But as it is the law is to help the poor man as I understand it; but as he is obliged to stay on the land continuously it defeats the intent of the law; for a man must have at least \$400 or \$500 before he is able to go upon a wild piece of land and make a living the first two or three years. If the law would compel him to break five acres and build his house the first year, and the second year cultivate that five and break five more, and the third year cultivate that ten and break five more, and by the end of the third year must move on the land and live thereon continuously the last two years, and break five acres each year and cultivate the other; so at the time for final proof he must have at least 25 acres under cultivation, a house, &c.—say the whole improvement must be worth at least two or three hundred dollars—in order to prove up on the tract. That would give the poor man a chance for farms to be opened up; and that is what is needed. I hope you will inquire into the matter and get the opinion of others upon this subject. I know of a number of men in my county that have done with their homesteads as I have stated, and now reside upon and have good farms opened, and spent all the money they have made on the land; but as they did not and could not live on the land the first two or three years will fail to obtain a patent therefor; and yet have farmed it every year, and spent all they have earned upon the land: and some of them have now \$500 worth of improvements upon the land; and it is an injustice for them not to obtain a patent for the lands.

7. Agricultural and pasturage.

8. By giving one man a certain amount of territory to report on.

10. The present is good enough, making the requirements on pre-emption and homesteads, making them open up some of it, and letting them have until the third year to move on the lands; making them open up more of it and not allowing them to be off would be impossible.

#### AGRICULTURAL.

1. Have plenty of rain.

2. Summer.

3. All of it.

5. None.

13. Yes; only giving him say one section.

15. Could not say.

16. Could not tell.

18. Increased.

19. Cattle are herded.

21. Plenty.

28. Yes; the stakes are burned out and the lines are in all conceivable shapes; should be resurveyed and the lines straightened.

#### TIMBER.

1. We have but little timber; none to speak of.

2. Cottonwood mostly; grows very rapidly.

*Testimony of William M. Cuppett, Canton, Lincoln County, Dakota Territory.*

The questions to which the following answers are given will be found on sheet facing page 1.

In reply to interrogatories received from Public Land Commission.

1. My name is William M. Cuppett. I reside at Canton, Lincoln County, Dakota Territory; am a wheelwright by occupation.
2. I have resided in this county nearly twelve years.
3. I have obtained one half-section of the public lands, one quarter-section under the pre-emption law and one quarter-section under the homestead law.
4. I have been clerk of the district court of this county since January, 1871, and have given some attention to locating parties on the public domain; also, making out entry papers and final-proof papers under the pre-emption and homestead laws.
5. Five and one-half years is the average time taken to acquire title under the homestead law. Some, however, make final proof immediately after a residence of five years, while others reside on the homestead for seven years. About two years is the average time taken to make proof and payment under the pre-emption law; however, majority of the first settlers of this county under this law, owing to the great distance to markets, &c., after living on their pre-emption for several years, changed to homestead, and therefore have lived on the same tract of land for as long as nine years.
6. In my opinion, the pre-emption law is defective in this: Section 2261 of the Revised Statutes prohibits any person who has filed a declaratory statement from filing a second. I believe it would be just and equitable, where parties have changed their pre-emption into a homestead entry, to allow them to make a second declaratory statement for other land and perfect title the same as they could have done on the first. I have but little fault to find with the homestead law as it now is. In my opinion, however, when a party brings a contest against an entry he should have privilege to file his application to enter the land, and in the event of the cancellation of the entry under the contest the contestant may then perfect his own claim. In many instances contestants have been unjustly beaten out of the land after having successfully presented the contest to the final cancellation of an entry by persons who have not a dollar's interest in the land. If this law was changed as I have suggested, it would not only be justice, but I believe it would have a tendency to bring about a more strict compliance with the spirit of the law by the settler.
7. The lands in this section are gently undulating; the soil black sandy loam, with clay subsoil. These lands are excellent for either grazing or agricultural purposes. The lands in this county are all occupied and are used by the settlers chiefly for the purpose of agriculture.
8. I believe the present system of surveys for agricultural lands very good.

## AGRICULTURE.

1. The climate is a very pleasant one, and, as a general rule, has a sufficient amount of rain to grow all kinds of crops. The exception, too dry. In my experience, however, I have known two seasons with too much rainfall. As a rule, the snowfall is very light. I have experienced four winters here without sufficient snow for a respectable sleigh ride.
2. The rainfall begins about the 1st of March, and frequent showers from then until the 1st of July. The seasons vary in regard to rainfall.
3. There are no crops raised here by irrigation, and therefore have no experience with the system of irrigation.
4. I am but little acquainted with what is known as the grazing lands of Dakota. I was with General Sully's expeditions in the western part of the Territory in the years 1863, 1864, and 1865, and have some knowledge of the grazing lands, and am free to say there is more grass grows on one acre of land in this county than there is on five acres of that.
5. It is estimated that about 3½ acres of pasturage land in this section is required to raise one head of beef for market.
6. It requires about ten head of cattle to support an average family.
7. There are eight head of cattle to the square mile in this county.
8. The growth of grass is increasing.
9. There is an average supply of stock water in this section.
10. I am unable to state how many sheep are equivalent to one beef in pasturing. But few sheep kept in this county.
11. The approximate number of cattle and sheep in this county is 5,500, and they are kept in herds ranging from 30 to 200.
12. There has been some difficulty in ascertaining the corners of the surveyed lands in this county.

## TIMBER.

1. The land of this county is nearly all prairie or lands naturally devoid of timber.
2. The kinds of timber planted are chiefly cottonwood, soft maple, and box-elder.
3. There are no public timber lands in this county, and I therefore cannot give any plan or make any suggestion as to the disposition of the same. There are no mineral lands in this section, and I have no experience in mining.

I am, very respectfully, &c.,

WM. M. CUPPETT.

CANTON, DAK., October 23, 1879.

*Testimony of F. J. Eisenmann, farmer and county clerk, Maxwell, Hutchinson County, Dakota.*

The questions to which the following answers are given will be found on sheet facing page 1:

1. F. J. Eisenmann, farmer and county clerk, Maxwell, Hutchinson County, Dakota.
2. Four years.
3. Under soldiers' homestead act.
4. None.
5. Five years, and \$26 for homestead.
6. None.
7. All agricultural lands.
8. Geographical division.
9. No reason.
10. By giving the right to two timber claims in one section, each claim to have 10 acres of timber.

## AGRICULTURE.

1. Climate good; rainfall, drought in 1879; length of season, seven months snow in winter about eight inches; water, none.
2. In the spring of the year, and not a great deal of it then.
3. All of it.
11. Lawsuits.
13. At least 200 acres.
14. It would be the best thing the government can do.
15. In 1879 it took 640 acres.
16. Here in Dakota about fifty head.
17. About 100.
18. Diminished since 1877.
19. Have no fences.
20. No.
22. Don't know.
23. Don't know.
24. Yes.
25. None, if good neighbors.
26. In 500; 3,000 in county.
27. Sell school lands.
28. Nothing but trouble.

## TIMBER.

1. No timber.
2. Cottonwood.
3. Dispose of it by giving it to actual settlers.
4. Would not.
5. There is not.
6. We have none.
7. There is none.
8. There is no timber cut here.
9. It would, if any.

*Testimony of William Haydon, Deadwood, Dak.*

The questions to which the following answers are given will be found on sheet facing page 1:

DEADWOOD, DAK., November 26, 1879.

To the honorable the Public Land Commission, Washington, D. C.:

GENTLEMEN: I have the honor to acknowledge the receipt of your circular, and also to have been appointed on the bar committee of Deadwood to suggest amendments to the present mining law of Congress. Differing as I do so radically with a majority of the committee, leave was granted me by the committee to submit my personal views, which I do, and submit them, crude as they are, for your consideration, for what they are worth. I have endeavored as near as possible to embrace my views in the form of answers to your interrogatories.

## LODE CLAIMS.

1. I have resided for twenty-six years in the mining regions of the States of California and Nevada, and the Territories of Utah and Dakota, and have been engaged during that time as judge of a court of general jurisdiction, lawyer, and mine owner.
2. The principal defects in the present United States law are: the size of the claim and allowing the miner to follow the dip outside of the side lines, and allowing local States and Territories to make local rules and laws on the subject of locating mines.
3. I think the practice should be abolished.
4. The croppings or highest point of the ledge appearing above or discovered beneath the surface. The apex, course, angle, direction or *strike*, and *dip* can in most instances be determined in the early workings of the mine.
5. I answer "yes" to this question.
6. I have.
7. Yes.
8. I cannot call to mind any such case.
9. There may be some instances, but they are very rare. I think in this region there are some.
10. Yes.
11. Under the present law I do not understand that a person has the legal right to "locate alleged lodes on non-mineral ground." The locator, as I understand the law, must first discover a ledge or lode of gold or silver bearing rock in place before the locator has a legal right to locate.
12. Such a case as stated in this question might exist, but, in view of my idea of the law in answer to the previous question, B would not have a good cause of action.
13. Yes.
14. I think not. The right to follow the dip outside of the side lines is one of the greatest sources of litigation.
15. I never have taken part personally in organizing local mining districts, but I am cognizant of much fraud being practiced in California and Nevada in making local rules and regulations. I have known instances where only two actual miners, who discovered a lode, invite a number of their friends from a distance, not miners, to assist in forming a new district, and pass laws most favorable to themselves, elect a recorder, and all done in a few hours over a gallon of whisky, and the guests depart, perhaps never to return. A 25-cent memorandum book is frequently used for the district records and carried about in the recorder's hat or pocket.
16. Generally there is a stake planted at the discovery shaft, on which is placed the notice of location, stating the amount claimed in either direction from the discovery shaft, the corners, the names of the locators, and amount of surface on each side of the ledge, which notice is recorded in the mining-district records. Miners frequently change the names of the locators on the notice and mining records, the stakes, and boundaries.
17. There is generally a provision for amendments, and it is the exception when they are not materially amended.
18. Yes, frequently; some of the grossest frauds I have ever known.
19. I think all local rules, Territorial and State laws should be abolished, and the initiation of record title lodged in the register of deeds' office in the county where the mine is located, and in cases where there is no organized county, then in the nearest county. Also, to file the certificate of location at the nearest United States land office after it is recorded in the county records, so as to form a basis of future action in the land office, if required by the locator.
20. Yes.
21. In answer to the first paragraph of this question it would be easier and more in harmony with my previous answers to say repeal the present law and enact an entire

new code. There would necessarily be so much detail involved in the proper answer to the last paragraph of the question that I am not prepared, satisfactorily to myself, to answer at present as I would upon further consideration; yet I will suggest the main outlines of my theory of the best mode of location and the acquisition of the title.

First. Confine the right to follow the dip vertically downward to and within the side lines. The right to follow the strike should be confined within the end lines. The size of the claim should be 500 feet in length along the ledge, and 2,000 feet in width, which would enable the miner to follow the dip, inside of his side lines, as far downward as would be profitable to work. The miner to have forty days from the time he commences work on a ledge to determine the strike and dip by sinking a shaft or running a tunnel on the ledge, 10 feet deep or more, and within twenty days thereafter to mark the boundaries by placing a stake 3 feet high, or a monument of stone the same height, along the boundary lines every 50 feet; place a written notice, on a stake 3 feet high, at the discovery shaft or tunnel, stating the number of feet claimed, the course, the name of the locator and mine, and within twenty days thereafter to record a sworn copy of said notice in the county records, and ten days thereafter file a certified copy of said recorded notice in the land office nearest the location—in cases where there are no organized counties where the mine is situated, then the nearest county within the State or Territory from where the mine is situated. The time shall be extended one day for every fifteen miles the mine is distant from the place of county records and land office over one hundred miles, except where there are daily or tri-weekly mails to the respective places. Within sixty days after filing said notice of location in the land office he must demand, at the land office where his location is filed, a survey of his claim, which shall be surveyed by a United States surveyor free from all cost on the part of the locator. Within six months thereafter he must apply to enter said land and pay for the same at the rate of \$5 per acre. If the locator fails or refuses to apply to enter said claim within said six months he forfeits all right to enter the same, and it shall be subject to entry by any other person without further notice. Mining localities over fifty miles from a United States land office, the United States surveyor shall not be compelled to survey claims unless fifty or more applicants demand it who have filed their location notices in said land office. I think from the hazardous occupation of the miner he should be as much encouraged and his rights guarded by the government as the peaceful agriculturist. At present the method of acquiring a title to mining claims from the government is expensive and cumbersome, and deters and prevents many from applying who otherwise would. If time or space permitted I might offer lengthy arguments in favor of the main features of my plan, which may be summed up as follows: To confine the locators within their lines in pursuing the dip or strike; to give him all within his lines; to abolish all local rules and regulations, State and Territorial; lodge the initiation of record title with some State or United States officer; make it compulsory to enter the claim; relieve the mine from all expense of surveying, and place him as near as possible on a level with the agriculturist in acquiring a title; make the survey, made in accordance with the application suggested, be absolute evidence of boundaries, from which there shall be no appeal; the surveyor shall not make surveys overlapping each other; and all questions appertaining to the acquisition of the title from the government be determined by the land office. In brief, I claim for my theory more certainty in boundaries, more reliability of record title, more certainty as to the title of the ledge in its dip, a relief from seven-tenths of litigation under the present law, and an impetus to mining enterprises and better security for investors, and a large increase in national wealth.

All of which is respectfully submitted.

With considerations of high regard, I am, your obedient servant,

WM. HAYDON.

*Testimony of D. A. Mizener, lawyer, Davison County, Dakota.*

The questions to which the following answers are given will be found on sheet facing page 1:

1. D. A. Mizener, lawyer, Davison County, Dakota.
2. Seven months.
3. I have sought to acquire lands by virtue of pre-emption timber-culture laws.
4. I am engaged in the land business.
5. From six to eighteen months.
7. They are prairie, moderately undulating, and are good agricultural and pastoral lands.
8. By a general rule.
9. The present system of surveys.
10. I cannot; it is very good now if the law is fully enjoined.

## AGRICULTURE.

1. Mild climate; rather light, but increasing; seasons similar to those of Minnesota; not much snow falls; very good supply, but no irrigation.
2. Is needed here at all seasons; the rainfall is very equally distributed.
3. All in this and adjoining counties.
4. There is no irrigation here.
5. None.
6. At all altitudes.
12. No portions; but all can be so adapted.
13. I have had no experience in these lands.
14. I think it is not the best policy to put any lands in the market for private entry, as speculators would usurp from the poor, whom the government wished to protect.
15. This I could not definitely state. Well, and I think that the pasturage here compares favorably with other States.
18. Increases every year, where settled.
19. No fences; they could be.
21. From streams, rivers, and springs in abundance.
22. Could not say.
24. Yes, but not very well.
27. None.
28. Yes, much; and surveyors who laid out the land in sections and one-fourth sections were very careless in establishing monuments. There should be more caution used in seeing the work done well.

## TIMBER.

1. Only some scrub timber.
2. Maple, cottonwood, willow and box-elder; cottonwood the best.
3. By sale in small tracts, from one to two acres, for the reason that most could have the use of it; and not held for speculators.
5. There is a second growth; it is generally slow.

*Testimony of Ole Sampson, farmer and stock raiser, Gayville, Yankton County, Dakota.*

The questions to which the following answers are given will be found on sheet facing page 1:

*To the honorable Public Land Commission:*

GENTLEMEN: The circular received from you I hereby return to you with the few answers to the numerous questions that have come under my observation:

1. My name is Ole Sampson, residence Gayville, Yankton County, Dakota; my occupation, farmer and stock grower.
2. I have resided here since 1859.
3. I have acquired title to 320 acres of the public lands under the acts of Congress providing for the pre-emption and homesteads to actual settlers.
4. I have never had any means or have I sought any, except so far as pertained to my own titles.
5. I do not know as to any cases except my own, they being uncontested cases, and I complied with the requirements of the departments and the local land office where the lands are situated.
6. The requirements of the departments and local land offices as is now in practice is in my judgment too difficult and expensive for men that can ill afford to pay the extra fees and expenses that have been added by the late law or rules of the Secretary of the Interior. It now costs \$31 to perfect title to a 160 homestead, instead of \$18 under the former practice. Besides, a person is compelled to employ some person competent to make out all the papers and proofs required that was formerly done by the officers of the local land offices, although now the fees of the officers are double that of former times. The law in that respect should be so changed and modified as to simplify and lessen the trouble and expense incurred under the present rules.
7. The lands in this county are adapted both for agriculture and pastoral pursuits. We have no mineral, as far as yet known.
10. The system of homesteads to actual settlers should be changed by requiring the settlers to plant and maintain a certain number of acres in various kinds of forest trees in addition to the other requirements of the law. The timber-culture act should be changed by requiring so many acres to be planted and the trees a greater distance apart, as the timber would grow better and attain a larger size, or else each claim

should be reduced to 80 acres instead of 160 acres, as now, and allow two entries to be made in each section instead of one. As now, it deprives the majority of settlers of the benefits of the law, and only one-fourth of the settlers can avail themselves of the law. Those that first come to the country take all the timber claims and the later ones cannot procure any, as the 160 acres allowed in each section is previously taken; and I think that such a change would meet with approval by the majority of the persons intended to be benefited by the law.

#### AGRICULTURE.

The climate is healthy and dry. We have the average rainfall of the western country during the months of April, May, June, and September; very little snow in winter. No irrigation used to my knowledge.

14. The land should be retained for actual settlers; land open to purchasers at will is nearly in all cases held by speculators until such a time as the actual settlers surrounding it has made it valuable, and then sold in small parcels at high prices to settlers; and besides, it retards settlement.

Yours, respectfully,

OLE SAMPSON.

#### *Testimony of Vale P. Thielman, clerk of district court, Turner County, Dakota.*

1. Vale P. Thielman, Swan Lake, Turner County, Dakota. I am clerk of district court of Turner County; am a dealer in real estate and locate settlers on public lands.

2. Have lived in Turner County since 1870, when it was organized; was the second settler in it; have lived in Dakota nearly fifteen years.

3. I have acquired the title to 160 acres of government land under the pre-emption law.

4. I have attended exclusively to land matters such as locating parties on government lands, making out their filing papers under the homestead, pre-emption, and timber law, and attending to contested cases for the last nine years.

5. My 160 acres cost me as follows: house 10 by 12 feet, \$75; five acres breaking, \$25; well, \$6; three hundred forest trees, \$5; one agricultural college scrip, \$170; total, \$271. I lived on the land six months, was a single man then; during the six months I earned my board and \$87; other cases that have come under my observation that have cost less, and some a good deal more. Under the homestead law a person with any tact can make more than his living and gain title to their land in the bargain.

6. A person in contesting a previous entry has to bear all expenses and has all the trouble, but has no further right to the land than any other person; and in many instances the party who enters and sustains the contest does not get the land. There is at present a system of telegraphing between attorneys at Washington and others here. *perfectly legal*, but it cheats a great many out of land which seems to rightfully belong to them; i. e., A takes a homestead and abandons it, B contests it, comes to trial and proves conclusively that A has abandoned the land, the case goes on its regular routine and it costs B generally from \$15 to \$100 to work the contest through. In the course of time the contest is ended, and the old entry is declared canceled. B has built himself a house on the land and lives there; in the mean time comes C; he has watched this land, has laid out no money or time (but is the drone); he has employed an attorney in Washington, this attorney watches when this claim is canceled and always knows just when that letter informing the register and receiver of the cancellation leaves the General Land Office for the post-office, he then sends a telegram to his client who at once makes some hasty improvements on the land and rushes to the land office and files on the land before the B finds out that the cancellation has reached the land office, and the result is that B either loses the land or maybe gets half of it. I think it would be justice to the poorer and hard-working class of people if the law was such that the person who contests a claim, has all of the expense and trouble, should also have the first right to file on the land or otherwise have the right to file on the land when he enters the contest, subject to the contest. This would also prevent parties who make a living by contesting claims and making money out of innocent parties from following their calling; i. e., it is a well-known fact that in new countries like this there are a good many people who set themselves up as attorneys; they run across a poor innocent farmer who has not been able to live on his land all of the time, still the land is not abandoned; they file a contest on his land, then go to him and tell him that they intend to take his land from him, and generally make a bargain with him and get from \$25 to \$100 to withdraw the contest; and a great many other ways there are under the present law. It is also a well-known fact that at least one-half of all the claims of land (or quarter sections) are paid for or proved upon without the parties claiming them having lived on them and improved them according to law. I know personally of several claims where the people never lived on them, also where they

was not sufficient improvement. The law is strict enough, but these matters are not looked into enough. Sometimes witnesses are examined before grand juries but hardly ever any indictments found, as there are so many and it would be hard to know where to begin. I believe if a commissioner or commissioners could be appointed who at stated periods would visit localities and inspect improvements and hear testimony and give titles to land, it would be better for honest settlers and the government, and would hinder the great amount of swindling that is carried on.

7. Our Territory is all (with a small exception, the bad lands) good farming lands. Our county (Turner) is unsurpassed for agriculture or stock raising.

10. It is the opinion of most of the people who are best acquainted that the government is too liberal or gives too much land. A person can now get 480 acres of land, and there is not one farmer out of fifty who can use it. The result is a good deal of our land gets (where it was never intended to go) into the hands of speculators. I think if our laws were so made that any one person could only take 160 acres of a homestead and could only keep that by living on it and improving it, it would be more satisfactory. At present the settlements are so thin that people cannot have school and church privileges, and nearly every other quarter section is owned by some one that does not live on it and that holds it for a raise in land. One hundred and sixty acres of farming land is enough to support a good large family, and give a good support and have neighbors close together, and if parties taking homesteads were compelled to live on them, say, six or seven years or lose them, none but those who intended to take them and make a permanent home out of them would have anything to do with them, and such a law would hurt none that were honest in their intentions, but on the contrary would protect them and keep adjoining land out of speculators' hands.

Very respectfully, your obedient servant,

VALE P. THIELMAN.

*Testimony of E. C. Walton, farmer, Gayville, Dakota.*

The questions to which the following answers are given will be found on sheet facing page 1:

1. E. C. Walton, farmer; Gayville, Dakota.
2. About eight years.
3. Under the homestead laws.
4. Not much.
5. No knowledge.
6. None.
7. Principally agricultural and pastoral; no minerals and little timber.
8. General rule.
9. No practical acquaintance with surveys.
10. No suggestions unless it be a more rigid ruling as to actual improvements and continued residence on the lands given as homesteads and entered pre-emptions.

AGRICULTURE.

1. There is a sufficient supply of snow and rain; climate dry; six months winter, including one-half fall and one-half winter.
2. Spring, fall, and summer, usually when needed.
3. All.
5. None.
6. No experience.
7. Know nothing about it.
12. About one-twentieth.
13. It is not practicable.
14. It is not advisable.
15. Eight acres, fair average.
16. Twenty.
17. About ten, though there is a material change in the last year, all trying to increase in cattle on account of hard times from grasshoppers.
18. Increased where the old grass is not burned until spring.
19. A Territorial herd law is about all the fence. No.
20. No.
21. The Missouri, Dakota, Vermillion, and Sun Rivers, and Clay, Turkey, and a few other creeks. They often use well-water drawn up by windmills.
22. Ten.

23. Very little knowledge, but think it diminishes.
24. Yes.
25. None, to our knowledge.
26. First, about 3,000 or 4,000; second, from 20 to 250; sheep, 20 to 500.
27. A more rigid rule in regard to accurate surveys and establishing of section corners and quarter corners.
28. Great trouble; a great many have had to have their claims resurveyed to find lines and corners; and, as to timber claims, it should make no difference if there was a half dozen trees or saplings on it, or even a half acre of willows, for that amount often hinders actual settlers from getting their lands contiguous, when in reality the timber on it does not amount to anything to them, as it is often nothing but brush.

#### TIMBER.

1. Considerable along the Missouri River, principally cottonwood, some box-elder and a little oak.
2. Mostly cottonwood, though there are some nice box-elder groves.
3. I would sell them to actual settlers in five-acre lots, and no more, at \$5 per acre, for the reason that all must have timber to improve land and fuel. Some who get timber claims charge \$8 to \$12 per cord, and settlers object to buying.
4. I would sell in square five-acre lots and no more, at \$5 per acre and no more, unless it were in heavy districts of timber and scarcely no prairie, then I would sell in 80-acre lots at \$2.50 per acre.
5. Very limited; second growth does not amount to but very little; perhaps a great many sprouts start up, but generally die before large enough for anything.
6. Often started by the Indians. Place them all on reservations, with penalty for any one to start fire purposely or carelessly.
7. It is a great waste; should be sold to railroad by the tie, and superintended by a commissioner, and laps given to actual settlers. All waste prosecute.
8. The custom is to cut and slash away; each individual or corporation tries to get the most, and in consequence there is great waste. Generally, those who cut the trees claim the whole.
9. They would, decidedly, provided the laws were very strict on land officers, with penalties for non-performance of duties, and also penalties for going beyond their jurisdiction.

*Testimony of Gustavus A. Wetter, register, and Lott S. Bayless, receiver, United States land office, Yankton, Dak.*

GUSTAVUS A. WETTER, register, and LOTT S. BAYLESS, receiver, at Yankton, Dak. testified, November 7, 1879, as follows:

The forms in the land office should be simplified to such an extent that three-fourths of the labor at present performed could be saved. By decisions and constructions the department has increased the labor of making out papers more than 50 per cent.

Fees should be abolished, and the salaries of registers and receivers fixed by law. There is more business and labor at an old office than at a new one, and many old offices do but little over a thousand dollars a year. Old offices answer more letters, handle more suspended cases, and get up more proofs than a new one. Registers and receivers should have a seal. In this district parties have forged the names of both register and receiver of the United States land office, and mortgaged lands through the use of forged final proofs. A seal would obviate this.

Registers and receivers should have the power to subpoena witnesses and perpetuate testimony. Registers and receivers sometimes sit a fortnight now on contested cases. The government should allow rent, as all other offices get rent and fuel. Persons doing business require to be comfortable. Office rent should be allowed in addition to a room in which to hear contests. Titles of instruction to prove up should be abolished, and the law repealed. There has never been a contest since the law passed. The objection notice is now published in the newspapers of any places, and heavy charges are exacted for such publication. The register is burdened with keeping accounts of publishers.

It now requires two to three years, and sometimes from five to six years, to get a patent from Washington. They should be all issued in turn. Members of Congress and attorneys frequently get patents for settlers. This office knows nothing of them, no word is sent here of the issue or delivery of the patent so the books can be marked correctly. In abandonment and relinquishment of homestead, pre-emption, and timber claims, as the registers and receivers take proof and recommend action to the department, and this is the basis of action by the General Land Office, registers and

receivers should at once, on proof of abandonment or relinquishment, permit legal settlers to enter on the land. It now requires from one to eight months to get a tract cleared for entry under this rule from Washington. It makes dangerous and vexatious delays, and casts odium on the district land officers. We know of cases where persons who should have been permitted to file, and were the rightful owners, have been deprived of their rights by parties who obtain information from Washington as to cancellation and take advantage of it.

We see no reason why a settler should not be permitted to file an application for a homestead or declaratory statement, or for a timber-culture claim, as often as he likes. He enhances the value of the land and makes new homes. The law does not contemplate that the first act is final.

The exactions of the homestead law at present as well as of the pre-emption are onerous. The only question asked by the register and receiver should be, "Have you complied with the law?"

This district, 30 miles wide and 90 miles long, is purely an agricultural district. Some timber has been planted, mostly cottonwood and box-elder and oak. Walnut trees have also been planted.

Crops are raised without irrigation. For eight years there have been rains during the summer, enough for crops. They usually come in March and April. We raise all the grains, flax, &c., the same as in the Middle States.

This is a fine grazing country; sheep particularly thrive well on account of dry winters. They are of mixed breeds, and are worth from \$2.50 to \$3.50. Each sheep clips from 4 to 6 pounds of wool. The cattle are of mixed breeds and some of them are good. Calves are worth from \$4 to \$5; yearlings, \$12 to \$15; two-year-olds, \$12 to \$18; cows are worth from \$25 to \$30. Butchers pay from 2 to 2½ cents per pound.

We have more than 800 families of Russians and Mennonites, who first commenced coming in 1872.

All the mills on Jim River have been idle for five months, because one B. M. Smith built a dam 14 feet high across the river, which has flooded about 50,000 acres of unsurveyed agricultural land belonging to the government. This was done for the purpose of enabling them to make a lake, so that they could call it reclaimed land, get it meandered by the United States surveyors, locate the fractions around the so-called lake with soldiers' additional scrip; then cut away the dam, let the water out, and claim all the land that the water covered as reclaimed land. The surveyor-general of the Territory ordered his deputies not to meander the lake, so the movement failed. Sixty miles above the dam the river was brimfull, while in Brown County, below the dam, it was totally dry—cutting off all the mills for 180 miles to where it emptied into the Missouri. There was a small summer-dry lake called Sand Lake, just above this dam, which they widened over two townships of United States government land. They claimed they wanted to make the stream navigable from Sand Lake to Jamestown, on the Northern Pacific Railroad, a distance of about 128 miles. The result was the settlers got indignant because they could not water their stock, and the mill men could not run their mills, so some one cut away the dam.

The General Land Office should issue for general circulation, through the district land offices and otherwise, a compact pamphlet containing the laws, points of instruction, and the rights and duties of settlers under the respective laws. This would save correspondence and give much needed information. The only entries in this district are pre-emption, homestead, and timber-culture locations.

All scrip should be abolished, or it should be redeemed by the government in money and not located in lands. They make much trouble and occasion loss, because counterfeits are in circulation. We were informed by the register and receiver at Sioux City, Iowa, that about 200 pieces of counterfeit and forged scrip were located and patents issued before they were discovered. The department ordered back the patents which were still in the district office, but lost those which had been issued. The loss fell on innocent purchasers.

---

*Testimony of Daniel Bacon, publisher of the Boise City Republican, Ada County, Idaho.*

The questions to which the following answers are given will be found on sheet facing page 1:

BOISE CITY, IDAHO, September 30, 1879.

DEPARTMENT OF THE INTERIOR:

DEAR SIR: In compliance with your request I hereby answer the following questions:

Most respectfully, your obedient servant,

D. BACON.

1. Daniel Bacon, Boise City, Ada County, Idaho, publisher of the Boise City Republican.

2. Thirteen years.

7. The public lands are of several classes. First. Sage plains destitute of water, lying in the most part where they can with considerable expense be irrigated and made productive. Second. Arable lands situated along water courses and in the low valleys, where the labor of irrigation is small. Third. Hilly and mountainous lands, well adapted for pastoral purposes. Fourth. High mountains, covered in the most parts with pine and fir. Fifth. Mineral lands, embracing in a large portion the two latter classes.

8. I would recommend that a commission be appointed (assisted by at least one practical geologist and mineralogist) to designate the several classes.

9. The sage plains should be granted in large parcels to those who will utilize them. The pastoral lands should also be surveyed in large parcels, with reference to the natural water courses, so as to accommodate as many locations as possible. The mineral lands should be surveyed in small parcels, and sold with some restrictions. The timber and arable lands should be subdivided in conformity with the present system—the arable lands disposed of to actual settlers only, and the timber lands to those who own farms, or mines, or saw-mills, or are settled on them and make a subsistence from their proceeds. (Your attention is respectfully called to our editorial on "Vine Culture," which will be found in last week's issue, September 27, Boise Republican, which is transmitted to you.)

#### AGRICULTURE.

1. The climate is mild. Length of rainfall six months, from the first of November to the first of May, in the valleys. Snowfall in the mountains corresponds to the rainfall in the valleys, with this exception: commences a little earlier in the fall, and continues a little later in the spring.

2. The greatest supply, caused by the melting of the snow, comes when most needed.

3. None.

5. All the cereals and fruits indigenous to the Northern States.

6. Fifty miners' inches on an average.

7. The rivers. The supply is abundant.

8. From my experience and observation on this coast for the last twenty-nine years I am of the opinion that irrigation is especially beneficial to the soil, and that crops can be raised and successfully cultivated in any altitude below 4,000 feet.

9. There is no restriction whatever. The water that is not utilized returns voluntarily.

10. Only a small moiety has been claimed in the different streams, and in Snake River none.

14. Limited. Certainly.

18. Diminished.

19. No.

20. No.

23. Diminished.

24. No.

#### TIMBER.

2. Lombardy poplar, principally on account of its rapid growth.

3. For the reason that such lands are nearly all mineral lands, and worthless for agricultural purposes. I would favor leasing them in small parcels, say for \$1 per acre, and not to exceed 160 acres to any one individual, the time not to exceed ten years.

5. There is a second growth of the same variety; grows slow.

7. The government timber is the chief source of all our supplies for mining, building, agricultural, and fuel. The timber we must have or break up housekeeping, and should it fall into the hands of speculators we would find ourselves removed from the "frying-pan into the fire." If the United States must dispose of it, then parcel it out to those who own mills, ranches, mining claims, and actual occupants, who maintain themselves by their own industry. This would prevent unnecessary waste, and, to a great extent, destruction by fire. Fire alone destroys more than is consumed by all other sources.

8. There is no restriction for cutting; but whoever constructs a road into the timber claims exclusive right to travel the same. Whoever fells a tree has the possessory right to it.

9. I think not. If the land agent should attempt to force an arbitrary law he would be obliged to travel to the mountains and cut his own fire-wood, or aid and abet those who were breaking the law.

## LODE CLAIMS.

1. I have been for the most part of time for the last twenty-nine years engaged in mining in California and Idaho.

2. The general government ought not to delegate to the Territorial governments any power to make mining laws. Public land agents should be recorders for mining claims. In the several districts there should be chosen or appointed deputy recorders, whose duties should be to see that the claims were properly surveyed and marked on the ground, and the locator should have proper time to ascertain the direction of his vein or lode, do his first assessment, and on report of the facts to the deputy it would be the deputy's duty to see the work and certify thereto; then, and not until this has been done, should the records be transferred to the books of the public land agent. In Idaho all district regulations have been abolished by the general assembly, and the county recorders are made the recorders of mining claims, and ten days is the limit for making record of claims. This works great inconvenience and injustice in many cases. Sometimes it is difficult to travel to the county-seat in the time required.

3. The practices should at once be discontinued, as it gives chance for litigation that otherwise would not arise. No recorder should be allowed to make a record of the same ground to two parties, and it should be the district recorder's duty to know that the applicant was entitled to the privilege of prospecting the ground before entering his claim on the books.

4. The apex or top of the vein or lode is the highest point of the center of the ledge. The course of the vein or dip cannot always be determined by the early workings of a ledge. In my experience, frequently hundreds of dollars are expended before either the course or dip of a ledge has been determined. I refer you to an article in the last issue of the *Boisé Republican*, entitled "The Comstock of Montana."

5. They are not.

6. There has been.

7. Yes.

Should you desire more specific answers or explanations to the above, or answers to any questions that have been omitted, I will be happy to serve you.

Yours, most respectfully,

DANIEL BACON,  
*Boisé City, Idaho.*

*Testimony of George Chapin, farmer and stock raiser, Goose Creek, Cassia County, Idaho.*

The questions to which the following answers are given will be found on sheet facing page 1:

1. George Chapin, farmer and stock raiser, Goose Creek, Cassia County, Idaho.
2. Territory ten years.
3. No.
7. Mostly desert and stock range.
8. All desert lands without water; with water, good agricultural lands; most of it can be irrigated, and canals practicable.
10. Nineteen-twentieths of the public land in Idaho is absolutely worthless without the introduction upon it of water for the purpose of irrigating it. The hills and mountains, good stock range. The plains are a desert without artificial water. Government should grant subsidies to companies or individuals who would construct canals. All valuable and productive when irrigated.

## AGRICULTURAL.

1. Plenty of water can be had by the aid of capital.
2. Winter and spring; it comes a little before most needed.
3. None.
4. Nine-tenths.
5. All kinds that are raised at the north.
6. Two cubic feet per second for thirty days.
7. Rivers and creeks.
8. Irrigation improves the soil; 5,000 feet.
9. Waste water usually returned to the stream or main ditch.
10. Only to a very limited extent under United States law and local custom.
12. Mountains and narrow margins of rivers and creeks.
13. It would require thousands of acres of such pasture.
14. Settlers have the unlimited use of these lands now for stock range.

15. One thousand acres each.
16. The increase of 500 head, or 50 milch cows.
17. About three.
18. Diminished.
19. A few have fenced; can be confined safely.
20. Not particularly.
21. Creeks, rivers, and springs.
23. Diminished.
24. Not long.
25. No legal conflicts.
26. Twenty thousand; they roam at large.
27. Greater inducements to those getting the water on them.
28. Yes; the stakes usually rotted off and broken down and lost.

## TIMBER.

1. Only on mountain tops—white fir.
2. Poplar; five years.
3. I would reserve the timber for the use of all settlers in this section; would not dispose of them.
4. The timber is on the high mountain peaks and in steep mountain gulches.
6. The government should impose a fine on the careless.
7. Timber here is limited and should be reserved for settlers.
8. United States law.
9. Yes.

• *Testimony of James A. Chase, probate judge, Marsh Basin, Idaho.*

The questions to which the following answers are given will be found on sheet facing page 1:

MARSH BASIN, CASSIA COUNTY, IDAHO, *September 24, 1879.*

*Public Land Commission, Washington, D. C.*

MESSRS: Herewith I return the interrogatories furnished, together with answers to some of them.

1. My name is James H. Chase; Marsh Basin, Idaho; by occupation at this time probate judge.
2. About two years.
3. I have not for myself.
4. Considerable part of declaratory statements, affidavits, proofs, &c., are made before me as a court of record for the local land office.
5. I hear of no cases from which I can form a rule.
6. Yes; the law ought to be made explicit about parties going *in person*, or not going, to the local office to make final proof. Where parties live more than 30 miles from a land office they should be clearly allowed the right to go before any local officer having a seal and giving bonds and making all proof, and send fees and payments in the usual business way to the local land office. It is a great hinderance in the sale of lands that parties have so often to go and take witnesses on these long and expensive trips. In cases of contest the land officers could be authorized to designate some officer within the county where the land is before whom the testimony could be taken, and forward the same to the local land office or the commissioner general for their consideration and action. Again, I think the general government ought to be bound by the acts of its officers. If I send money in payment for land to a United States land officer, he receiving and receipting for the same, and fails to apply the money to the purpose for which I sent it, the government will not issue to me my title unless I pay again, and perhaps the third time. The fees for newspaper publication in land-office matters and the fees in general might be reduced and a sum stated to be charged and no more allowed.
7. In this county and Territory as well the greater part of the surface of the country is only adapted to pastoral or grazing purposes. It is hilly and mountainous, but with no lack of good soil over hills, mountains, and in valleys. The only timber (pine, fir, spruce, and poplar) grows on and in the cañons of the mountains.
8. Have not given the matter sufficient to suggest better plans than those adopted.
9. The same as last answer.
10. It is one of the severest struggles a poor man with a family can undertake in his lifetime to settle upon, pay for government land, and support his family all at the

same time. Many try it and fail after much deprivation, toil, and hardship. As a rule, in these Territories, to conquer a piece of land and fence it, making it in any way valuable, and paying the necessary fees to land officers, is worth all the land is worth. If the price of land was less the government would derive more revenue from them.

## AGRICULTURE.

1. Here the climate is dry, cool, and bracing to man and beast. Rainfall and snowfall are insufficient to irrigate *all* the good and otherwise fertile lands in this Territory. The seasons of mildness here in this county are too short for fruit-growing.

2. The water supply is principally derived from the melting snows, and for the most part comes from the mountains into the fertile valleys when needed to grow and ripen crops.

3. Comparatively none.

4. Not more than one-third of the area in this county, and this perhaps would be true of the whole Territory.

5. Wheat, oats, barley, potatoes, &c., &c., and good crops.

6. No accurate knowledge from which to report.

7. The whole or less of Snake River could be easily taken from its bed and made to irrigate a half million acres of rich and level land. In the near future this must be done either by private capital or the government.

8. Proper irrigation enriches the soil; improper, washes it away. Where land can be watered grain will grow and ripen in good yield 6,000 feet above the level of the sea.

9. Most of the supply of water is exhausted in irrigation; the surplus is returned to natural channel by local regulation.

10. The water has mostly been appropriated where it could be done cheaply; other and larger supplies are awaiting the investment of private capital.

12. Almost the whole area of the Territory, mountains and all.

13. It is not now practicable. When inventions shall render durable fencing cheap, then it will do.

14. It is not advisable to put pasturage lands of this Territory in market until they can be fenced, and then the limits should be liberal—at least one half or whole section.

15. The country is too extensive, too wild, too careless in habits to answer the first of this question, but from extensive travel I think this is the best beef-raising country I ever saw. A fine rich grass grows over the surface of nearly the whole of it, which is sufficient to keep cattle fat the year round.

16. I am unable to answer, but calculators say stock-raising here is equal to 5 per cent. per month on the investment.

17. There are probably 20,000 head now in the county and half as many horses, but few sheep.

18. The grass has diminished largely, but not owing to stock; several winters of light snows in succession have told heavily on the grasses.

19. They do not. As a rule it would be safe to confine cattle on a range by fence, but there are winters in which stock has to be fed.

20. No; a variety of ranges and feed make the best beef.

21. From large and living springs from the mountains.

22. Five or six sheep are considered by stockmen to be equal to one beef in grazing.

23. In all dry countries sheep will kill out the grass. It is to be hoped this country will escape the calamity which has fallen upon California through sheep grazing.

24. Not agreeably or prosperously. Sheep leave a stench upon the ground which is offensive to other stock.

25. None to speak of as yet in this Territory.

26. Probably about 5,000 sheep, but the county is almost exclusively given, so far as it is used, to cattle and horse raising.

28. There is much difficulty in finding corners or lines on surveyed lands here; that work has been very sparingly done; it should have been done, and all lands to be surveyed, in such manner that corners would be visible and permanent.

## TIMBER.

1. There is very little timber growing in this part of the Territory, and by reason of waste and culling and careless fires it is rapidly being destroyed. Enough of pine, fir, and spruce is growing here to supply all agricultural and mining wants, &c., and it is admirably adapted to the wants of the farmer in fencing. It is not preserved, however, and as it diminishes the climate will be affected by less snow and rain. I do not know of a greater national wastage than in the ravaging of forests on the public lands west of the Rocky Mountains.

2. None.

3. I would sell or give all timber lands to the States or Territories for the use of the

people thereof. They could make it the duty of some county officer, in their respective counties, without additional cost, to protect the growing timber and cause it to be used as a careful private individual would care for his own. To sell it to private parties would lead to a monopoly and cause much trouble to actual settlers. As the law now is, it is wholly inoperative with timber here, and the officer in whose care it is a thousand miles away. If the government continues to own such lands, a more effective way must be found to protect them. Men there must be whose especial duty it is to watch over the timber in these western Territories. If ever sold to private parties, very small tracts only should be sold to each party.

4. It would seem to be impracticable to classify them, for if in this Territory they are timber lands at all they are just alike and small variety of timber.

5. This country is hardly old enough in settlement to say what the second growth, if any, would be, but so far as I can observe, and I take an interest in all these matters, where timber has been cut so as to leave the ground nearly stripped of trees a kind of scrub bush, with wild cherry and service bushes, utterly worthless, spring up and take full possession of the ground.

6. The loss to this Territory by forest fires is incalculable. Every summer they rage, and they utterly destroy all green timber in which they burn. At the rate which I have observed, in three to five years there will be no green timber left in this Territory, and from that it will become almost uninhabitable. Empires preserve their forests; republics do not. It is not difficult to give the reason. From my judgment I reason that in almost every case these fires originate through carelessness and wantonness of men living near the timber. It is often rumored that Indians set the fire in a spirit of revenge, but I cannot discover any evidence leading me toward a belief of this. Nearly all these fires could easily be controlled and extinguished at their beginning, but "what is everybody's is nobody's business," and from indifference and an unaccountable apathy on the part of the settlers they are allowed to burn for months. There is law to make men turn out and assist a sheriff against a common enemy; there should be a law compelling men to assist the proper officer to put out the forest fires when called upon.

7. The wholly unnecessary waste of the timber on the public lands west of the Rocky Mountains in destructiveness is second only to fires. Every man pushes back, cuts, and culls the best, and breaks and destroys much of the young and thrifty timber. More close and stringent legislation would cure this evil, as well as control the fires. All laws passed by the general government up to this time looking to the protection and preservation of its timber, from my own observation, have been wholly ineffectual to check the destruction and waste. They are too far away, uncertain, and unexecuted. Millions are given for harbors and rivers for commerce, and hardly a farthing for the preservation of magnificent forests inland.

8. Every man owns all he cuts, and from a spirit of greed or speculation they often cut much more than they use.

9. Probably not; because the land officers are as far away and are no more interested in them than the present marshals.

#### MINERAL-LODE CLAIMS.

1. My experience in mining or opportunities for observation have been so limited that I can hardly make a suggestion further than to say that my impressions are that the law is not clear or explicit enough on the number of lode claims an individual may locate and hold. I have known of men in California and Nevada and this Territory to hold by location from one to twelve claims of full dimension. It is common practice among miners, or rather men speculating in mines. This often works a hardship on men seeking ground to work, and being unable to buy from the speculators. The law in this matter should be made clear and limit an individual to one claim in a State or Territory by location, and this should be worked to some extent. The law requiring \$100 worth of work yearly, in practice, is but little observed. Changing the law to meet such requirements would give employment to more men and more of the valuable ores would be extracted.

19. My opinion is that all mining-district laws, customs, and records could well be abolished as to future locations. They exist in so many and different localities and requirements they are a source of confusion to the miner. In nearly every instance these local laws and customs made in mining camps are of the flimsiest kind and least respected. Often a recorder is elected who is hardly able to write his own name. No books are provided, and the next week, perhaps, the recorder is up and gone for new diggings, leaving no successor. The only deference and dignity these local laws have is paid to them by the United States Congress. I am of opinion that the government can make a few and plain rules and regulations touching the location, size of claims, work, corners and lines, and possessory title, which, when disseminated through mining localities, would be more satisfactory to all concerned than the present local customs or laws.

20. I think the adjustment of controversies concerning mineral lands prior to issue of patent should be left where it is, in the courts, because in those cases intricate questions and points of law often arise, and land officers are not noted for their legal knowledge; indeed, for the most part, they are better known for their ignorance of the law and its practice. The whole plan of bringing litigation before tribunals unread in law and strangers to the practice of it is wrong and dangerous. Besides, the courts are held in every county, while the district land office may be two or three hundred miles away; this of itself would be an unbearable hardship. The tendency to make district land officers judges and courts of litigation ought to be, for the convenience of the people, restrained rather than extended.

22. Parties ought to be required to procure title to their mineral ground within a reasonable time. Two years from location would be reasonable. Much valuable mining ground has been entirely worked out, especially in California and abandoned, and this oftentimes by foreigners, without one cent being paid the government. No other country on earth is so negligent of its own interests and the protection of the rights of its citizens as this in respect to the working of her mines. From my own observation, thousands of foreigners take out their first naturalization papers for no object only to gain the right to locate, work, and traffic in mining claims, and when they get a sufficient sum they go back to their native country, never having the least intention of becoming a citizen of this. The first papers alone ought not to afford any rights or privileges in mining matters to a foreigner. Under our laws our mines of precious metals are being depleted, worked, and made available for wealth to the foreigner just as well as to an American born, and this is especially true of Canadians and English subjects, who make great complaint if an American catches a mackerel on their coast without paying for it, and they have to pay very dearly too. I know all this is *wrong* and ought to be remedied, and that quickly.

#### PLACER CLAIMS.

1. But little mining is carried on in this county; only some claims along on Snake River of very fine gold in gravel, but the ground is extensive for future locations.

2. I am somewhat familiar with the workings of the law. The law is obscure as to the amount of annual work or expenditure on placer claims. One hundred dollars' worth of work is generally construed to apply only to lode claims or quartz claims. It should be made definite on placer claims.

3. No data from which to speak.

4. No data from which to speak.

5. Prematurely answered under Question 2.

6. Answered under Question 2.

The size of placer claims is too large. There are more miners than mines. Ten acres would be plenty and just as effectual as more in the finding and developing of the ground. It is easy and common practice to consolidate claims in the hands of one man by purchase. It is also common practice for a miner to locate himself a claim, and then exhaust all or most of the ground in locations for other and distant or indifferent parties, and then procure a bill of sale or deed from those parties for nothing or a trifle, and then he owns the whole. The law in this respect should be clear that to make a valid location the party himself must go in person and make it.

#### COAL LANDS.

Concerning coal discoveries or lands, the same requirements should be made, and the number of acres in a location reduced from 160 to at most 80 acres. Like placer claims, if the coal ground is of any value, 10 acres of the former and 80 acres of the latter is plenty for one man. The time for title, price, and mode of procedure touching coal lands is well as it is. Every case of litigation in placer mining, within my observation, has arisen on the insufficiency of corners and lines being established and made visible. The law, however, bearing upon this is correct, and if changed at all should be made more stringent.

7. I do not know of any such instances.

8. I do not know of any such instances.

9. I have no knowledge at present of such case.

GENTLEMEN: All of the foregoing answers have been somewhat hastily written and they are based upon my better judgment. No doubt your attention has been called to all of the points or suggestions, given more fully and clearly than I have done, but none will be given in a kindlier or more sincere feeling to help improve the laws looking to the better protection of our public lands, forests, mines, citizens, and our government.

Very respectfully, your obedient servant,

JAMES H. CHASE.

*Testimony of I. S. Singiser, receiver of the land office, Oxford, Idaho.*

I. S. SINGISER, receiver of the land office, at Oxford, Idaho, testified September 20, 1879, as follows:

I think the register and receiver should have the power to summon witnesses and perpetuate testimony in matters relating to the land office. I believe in abolishing all the recorders of land districts and putting all the business in the United States district land office. I think, also, that the timber lands of the United States would be better protected if they were in the hands of the United States Land Office than they are now. I think that the notice of intention to prove up the land entry should be abolished. I do not see any use in it. It makes a strife among the newspapers who seek the advertisements. As the Land Department acts upon the proof taken by and the recommendation of receivers of the Land Office, I think it would be best to make the cancellation of land entries a matter for the register and receiver, and let the man on the land have the advantage in making the filing. The people down here think a man should be allowed to make as many pre-emption filings as he wants, going from place to place, until he finally gets a home. As you have a pre-emption clause in the homestead act, I think if you increase the acreage of the homestead that one act is sufficient.

I think there should be a pasturage homestead. I think that about 20 acres would sustain a beef and about 6 or 8 acres would sustain a sheep. Sheep tramp out everything. The greater part of water rights in this Territory have been taken up. There should be something done in regard to getting the marsh lands of the Territory in the market. We have four or five thousand acres right at Oxford, the best land in the Territory. Nobody owns it. It is not surveyed, and people are cutting hay from it.

There is another thing. I don't think the extra two years allowed in proving up on the lands is of any use; it only makes work in the land office, which has to send out two notices. I think all the papers of the land office might be consolidated, and there is a lot of questions in the final proving papers that are perfectly useless. I think it would be a good idea when a man comes to prove up a homestead or pre-emption entry to ask him just this one question: "Have you complied with the law?" and make the witnesses swear simply: has this man complied with the law?

I think it should be so arranged that the register and receiver could go about in their districts and take testimony. It would be a great accommodation to the settlers certainly. There was one man who came to our office who had to stage it two hundred and fifty miles and then fifty miles on horseback. I think that the pasturage lands of the Territory should be sold, and I think that the timber lands should be sold in small tracts not to exceed 160 acres, preferably to actual settlers. I think that timber lands would be more protected if people owned them themselves. It would stop depredations. There are a good many fires in Idaho. Indians and prospectors, &c., start them. They have been burning now during nearly all the summer. They have burned some of the finest timber in Idaho.

There is another subject I wish to speak of. We have a large Indian reservation in our district which is not at all utilized. It should be opened for settlement. It is about seventy-five miles long by sixty miles wide, and only the upper end of it is used by the Indians. The lower end of it is filled up with settlers. There are, I suppose, fifty or one hundred settlers (families) upon the reservation. They have been there many years, and the Territory of Idaho exercises its jurisdiction over them in collecting taxes from them. I think that there should be some system devised by which the rulings and decisions of the Land Office should be distributed to the various local land officers.

*Testimony of John Wood, stock raiser, residence State Creek, Idaho.*

The questions to which the following answers are given will be found on sheet facing page 1:

1. John Wood, stock raiser; residence State Creek, Idaho.
2. Sixteen years.
3. The land here is all unsurveyed.
7. Agricultural, pastoral, and mineral.
10. In my opinion there is none.

**AGRICULTURE.**

1. The climate on the rivers is mild; but very little snow, except on high ranges.
2. In the irrigating season there is no rain.
3. None.

4. About one hundredth part of this section.
5. Any crops that can be raised in a northern climate.
6. As much as in any other country.
7. There is plenty of small creeks along the foot-hills.
8. Crops can be raised at an altitude of 3,000 feet.
10. Under mining laws.
11. None.
12. Ninety-nine per cent.
13. In my judgment it should be homesteaded, and each homestead should have a section for pasturage.
14. It is, in my judgment, advisable to put the lands here in market for private entry, and the quantity to each purchaser should be limited.
15. Ten. This is the most mountainous.
16. One hundred head.
17. About fifty head.
18. It is about the same as when I first came here.
19. They do not fence, neither can they be confined with safety at any time.
20. They could not be confined.
21. Springs and Salmon River.
24. They will not; sheep will drive cattle off.

## TIMBER.

1. There is no timber except on the high ranges, which is fir and pine.
2. There is none planted.
3. The present timber law is as good as any.
4. I would not.
7. There is none here.

*Testimony of John C. Young, rancher, Marsh Valley, Oneida County, Idaho.*

The questions to which the following answers are given will be found on sheet facing page 1:

## Answers to questions submitted by the Public Land Commission.

1. My name is John C. Young; reside in Marsh Valley, Oneida County, Idaho Territory, and am a "rancher."
2. Have lived there only a few months, but was born and raised in Utah.
3. Have acquired 160 acres of land under the desert act and have sought to acquire 50 acres under the timber act, but have failed on account of grasshoppers.
4. Have been four years in the newspaper business and have watched the acquirement of lands under the present system pretty closely.
5. The expense and trouble of acquiring title to desert land is great owing to the outlay for constructing irrigating ditches. I believe that desert lands should be sold to canal companies incorporated under a State or a national law, which law should compel the absolute transfer by such companies of the water right with the land so redeemed by the canal. In the Rocky Mountain region all land is desert except natural meadows, which are limited both in numbers and extent; that is, no lands in this region, with the exception named, will produce agricultural crops without irrigation.
6. In Utah, it seems to me, the law does not protect non-Mormon settlers. I was once burned out and driven off a quarter section of public land because a Mormon settlement in Idaho "claimed" said land as a "co-operative herd ground." Now, Mormon settlers ought to be protected in Utah, but I presume they never can be fully until Mormonism as a theocracy is suppressed.
7. The whole Rocky Mountain region is made up of series of mountain ranges and valleys, with rivers, mountain streams, and springs, so that the public lands might be classified as irrigable, swamp, pasture, mineral, and timber, at least so far as Utah, Colorado, Nevada, Western Wyoming, Eastern Idaho, and perhaps Arizona and New Mexico are concerned, though as to the two last I cannot speak from actual observation. The irrigable and swamp (or meadow) lands are confined to the valleys; the pasture lands are the high "benches" or uplands lying above the lines of feasible canals and below the pine or timber line on the high mountains; and also those parts of valleys which cannot be reached by canals owing to the rolling character of the surface of the land. Such rolling in valleys I have noticed only near the northern, eastern, and southern rims of the Great Basin. The mineral and timber lands are about the same; that is, mineral, excepting coal, is found usually in the high mount-

ains, the mineral discoveries being made among the timber; but, of course, there are exceptional cases. As the rainfall is limited in the region indicated, and perhaps in Montana, while they have an abundance on the Pacific and Missouri slopes, I think the Rocky Mountain region from the British line to Mexico might with advantage to settlers and the government be constituted a geographical division, with the lands classified as I have stated.

10. In this region I believe the meadow or swamp lands ought to be acquired by homestead or pre-emption as under the present system, because they are the most valuable, yielding a return from the time the settler "squats" on them. The reclamation of irrigable lands by canal and the payment of \$1.25 per acre to the government should entitle every man to a quarter or half section where he makes the reclamation individually. Sales to canal companies should be governed in quantity by the capacity of their constructed canals. Such grants or sales should be made conditional, the canal companies being required to offer the land for sale to settlers in lots of from 40 to 320 acres at a price to be fixed by the United States district land officers, who should be required to base such appraisal on, say, double the cost of the canal and \$1.25 per acre on the tract reclaimed. Proof of the cost should be established by the company, and the settler should be made to establish his *bona-fide* intention of purchasing only for himself. The purchase price to be paid into the land office and a draft on the United States Treasurer issued to the canal company for the amount of the purchase-money, minus \$1.25 per acre for the tract of land and the water right so disposed of, and such water right should be fixed at one miner's inch to the acre, or seven miner's inches to the acre once every week.

#### AGRICULTURE.

1. The climate is good. We have little or no rainfall from the 2d of June to the 1st of October. We have only two seasons, winter and summer, the latter season lasting six months. The snowfall varies from 6 inches to 2 feet and is our source of irrigation streams.

2. We really have no rainy season. Our irrigating season extends from the 1st of June to the 1st of October, and we have high waters from the 15th of May to the 15th of June, when the streams begin to fall and continue to diminish in volume until the weather gets cool—October.

3. No portion of this country can be cultivated without irrigation, though the swamps yield hay.

4. I should judge, excluding the pasturage, timber, and mineral lands, that all the valleys might be classed as irrigable lands, and the proportion of these to the whole region I guess to be a tenth.

5. All the cereals and roots and the more hardy fruits are produced here by irrigation.

6. It will on an average require 500 miner's inches of water to irrigate 100 acres of wheat three times from the 1st of June to the 10th of July, but the same stream would under proper and economic regulations probably water 300 acres and mature the crop.

7. The rivers and mountain streams are the source of supply of irrigating water. Bear River in Cache Valley, the Logan, the Cub, and other smaller streams. The Snake River in Eastern Idaho would furnish a supply of water constantly sufficient to bring under cultivation between 75,000 and 100,000 acres of very good land lying on the east bank of said river and extending from the south fork thereof to the Black-foot River.

8. Unless an irrigating stream is impregnated with mineral the process of irrigation enriches the soil by depositing thereon lime and alluvial soil, so that as a rule irrigation is also a fertilizing process. Oats can be raised at an altitude of 6,500 feet, wheat at 5,500, but this varies according to the season.

9. All the water in the irrigating ditches is used during the summer and returned to the main streams after harvest. In Utah they have a very good system of irrigation laws. In Idaho there is no law on the subject—that is, not statute—though the common law has been extended over the Territory by the legislature, and I presume that would determine a water contest. The common-law rules on water rights in this mountainous country I think are almost totally inadequate, because, if insisted on by the first settler on a stream, the stream could not, in a majority of cases, be utilized by subsequent settlers.

10. In Idaho we are practically without either law or custom.

11. The pick-and-shovel conflict has frequently arisen between the saintly brethren in Utah.

12. At least one-half of this entire region is adapted to pasturage only.

13. It is not, in my judgment, practicable to establish homesteads on pasturage lands because the stock-raising business cannot be carried on by men of limited means. They find it necessary to join with it farming. Furthermore, stockmen in this country

are obliged to put up hay in sufficient quantity to "carry over" their cattle. The pasture lands yield no hay and are fit only for summer range, save in some winters when the snows are light and the winds high, the hills are swept bare, and cattle winter out; but even then stock seek the valleys, and this habit indicates that the hills are no place for them in winter, and therefore no place for a homesteader on pasturage lands.

14. In my judgment, these lands should be put in the market for public sale and not at private entry. These lands have very limited water supplies, or, as is more frequently the case, no supply of water at all closer than five or six and sometimes even ten miles. Take a place, therefore, with a feeble spring of water, ten miles from any other spring or stream, and allow a man to homestead this spring, and he henceforth holds the key to the entire pasturage lands for ten miles around him. If this spring and the range it commands were put up at public sale, say at from 10 cents to 30 cents per acre, the spring would sell the entire tract. Pasturage lands with mountain streams running through them would permit of smaller divisions, and such streams ought to constitute division lines, so that purchasers could all get their stock to water.

15. The average quantity of pasturage land in this section required to fat one beef for market, without ruining the pastures, is about 40 acres. This section is hardly as good as Colorado and Wyoming.

16. Two hundred and fifty would support an average family without joining farming with stock-raising; but the families in this country are more than average.

17. I cannot guess.

18. The growth of grass has diminished.

19. The ranges are not fenced. Cattle cannot be confined by fences on the range in winter with safety.

20. The quality of herds would without doubt be improved by confining them to specific ranges.

21. On the pasture lands proper the supply of water for stock is the small springs and mountain streams.

22. The Commission made a mistake in asking this question. They should have asked, "How many beeves are equal to one sheep in grazing?"

23. The grass is killed out where sheep have been pastured.

24. Cattle will not graze on sheep pasture, though the mutton is not particular as to who has been over the grass before him.

25. If the sheep don't leave the cattle range, the cattle soon become so much reduced in flesh that they cannot get away.

26. I cannot guess, and the people in this country pay no regard to such matters.

27. I have this suggestion to offer about the Ross Fort Indian reservation in Eastern Idaho. This reservation covers the best agricultural and stock-raising portion of the Territory and covers an area not much less than the State of New York. I believe this tract of land is owned by about 1,200 Bannock Indians, who, if it were divided up equally between them, would each—every buck, squaw, and papoose—have a small dukedom. Is not that kind o' spreading on to poor Lo a little too thick?

28. Question not answered.

JOHN C. YOUNG.

---

*Testimony of Col. Geo. L. Shoup, Salmon City, Idaho.*

Col. GEO. L. SHOUP, who resides at Salmon City, Idaho, testified, October 2, 1879, as follows:

Up in the northwestern portion of the Territory the land can be cultivated, but that I do not wish included in the estimate I make that one acre in seventy-five can be irrigated. The water supply, taking it on an average since I have been here, has been about the same. About four-fifths of the Territory is arid land; about one-third of the arid land can be used for pastoral purposes. It takes about 25 acres for one beef; that I consider enough. I owned about 3,000 head of cattle, but no sheep. It has never come under my notice, but from representation I should say that cattle and sheep cannot feed together. My county is fully stocked. The range is decreasing from overfeeding. If we owned the ranges we could keep them up and improve the quantity and quality of the beef. The increase of 100 head of cattle will keep an average family very well. The pastoral homestead idea strikes me favorably. If it is established it will be necessary for the stockmen to decrease their herds, unless the government makes some provision by which actual settlers will be protected, by allowing them to purchase this land, or lease it, or doing something that will place the land under control of the actual occupants. I think 10 cents per acre would be a very good price for this land. There is plenty of water. In that region everybody takes the water as they please. The rule in our section of country is that by making a location and taking the water from the stream and recording it in the county recorder's office a man

gets a priority or right to that water, and no matter if he makes his ditch big enough to take in all the water, there is no rule requiring him to turn it back; but it is local usage to do so. In some mining districts they have local laws compelling them to turn the water back into the stream.

We have no sheep in Lemhi County. Ours is considered a well timbered county; one-half of it is timber land, all of which is pine. We have no hard wood. We have big timber fires there, caused, I guess, by Indians, and occasionally by prospectors. These lands should be sold to actual settlers. If they were sold to individuals they would then have an interest in and protect them. It would be to their interest to do so. I would limit the size of the tract to be sold. I would sell it at a price depending upon its location. In our section the young growth comes up after a fire. There have been locations made under the pastoral law, and they have never paid for them. There should be a limit for paying for these placer claims. I have known instances, outside of our county, where a man selected a tract of land, working it enough to take it and then hold it for speculation. Lemhi County is the best watered county in the Territory.

Yoke Fork, Bay Horse, Leesburg, North Fork, and other mining districts are in our section. It is a very good mining district. I think it will produce more than any other three counties in the Territory. We recently had local mining laws, but now our laws conform to the United States laws. A law should be made compelling a miner to pay up inside of two years. We have not had much litigation as yet, but we expect it is coming. What litigation we have is on account of relocations. In a district where the veins lie parallel the same trouble would occur under a square location that occurs now. I think the charges in mineral surveys, &c., ought to be reduced. I think that all the business should be transacted in the district land office, and, just as in agricultural lands, all contests ought to be tried in the district land office; but in many cases the land office is so far away that it causes a great many people trouble to bring witnesses. If a law was passed so as to permit proof to be taken in a mining district and certified to before the clerk of the court of record, cases could be tried in the district land office and that objection obviated.

We have a splendid supply of water for irrigation if we need it. The altitude of the agricultural section of our county is from four to five thousand feet. The pastoral lands are above that. They are about 10,000 feet. The timber land is at about 10,000 feet altitude. We can raise all the cereals and all kinds of vegetables. We can raise corn, but it does not mature well. Our supply of water is ample for all our irrigable lands.

If a man buys a mine I would give him the timber that stood upon it, but I would sell the land separately, and I would reserve all mineral rights to the government. I think the timber land should be placed under the control of the register and receiver. I have but one patented mine in Lemhi County, and it took two and a half years to get the patent after I had paid for it. I think the law should be amended so that when a man gets a register and receiver's receipt that it is his property.

Idaho is a mineral and pastoral country. Our wealth lies in the mines and stock. There is no bunch-grass in our county.

My views regarding the disposition of the agricultural and pastoral lands are these. Those portions of the land that are agricultural should be opened for pre-emption for agricultural purposes at \$1.25 per acre. In making any change in the law I would reserve the irrigable lands and dispose of them under the present law. I do not think I would pass any law to assist companies in making irrigating projects. Cattle can be fenced with safety if the stock-owner could secure land either by lease or purchase. Very little timber has been cut off in our county. We have no surveyed land in our county. I think the whole of it might be surveyed. There are about one hundred farms in my county which have no title because the land has not been surveyed.

#### *Testimony of William M. Courtis, M. E., metallurgist, Wyandotte, Mich.*

The questions to which the following answers are given will be found on sheet facing page 1:

1. William M. Courtis, Wyandotte, Mich., metallurgist and mining engineer.
2. Eight years in Wyandotte, Mich.
3. Yes; mining claims in Colorado.
4. Have been in most of the mining districts of the State examining mining properties, titles, &c.
5. Can't say after four months; patent not issued yet.
6. Have noticed the following case in location of coal land claim on unsurveyed land, viz: A located claim of 160 acres, having only one place (on account of steep mountain side) from which his coal could be easily worked. B located adjoining

acres and had the township surveyed. When the town line is run it rearranges the claim lines so that B takes in A's dump land, which also happens to be the only good timber, making A's coal land valueless. B, however, to avoid a long lawsuit, compromised with A and pays about one quarter A's price before the lines were run. (Bunn & Smith, Crested Butte, Gunnison County, Colorado).

Have also noticed in locating mining claims the following difficulty: A and B are friends, and each locate 1,500 feet on same lode, intending to adjoin and work in concert. The measurements are made and stakes set up by tape-line measurements. When the properties are surveyed for patent it is found that there is from 50 to 200 feet between the claims not covered by claim notice on stake. This is either staked by surveyor or some camp loafer who makes it his business to follow round with the surveyor and locate such excess to force the parties to buy him out, as such small locations between are in the way, as he well knows. I think there should be a provision in the laws regulating location of mining claims, that if an excess is found between two claims caused by *bona-fide* errors in location stake the locators of those claims shall have sixty days to set new stake, each taking one-half, and the legal assessment on each piece shall be in proportion to the part of a full claim it may be.

8. By general rules; but make the classes to take their name from the greatest value for the location. Postmasters should report to the land office discoveries of mineral in their neighborhood, so that lands held, say as timber land, could then be changed to mineral land.

9. Think present laws are pretty good when not evaded.

10. At present a legal residence is far from an actual settlement as intended by law. Persons and companies buy up the rights of others to enter land. Laws should be more stringent in defining "actual settlement." No experience on agriculture and timber questions.

#### LODE CLAIMS.

1. As assistant manager at Van Buren Furnace, Shenandoah County, Virginia, 1869 to 1871; metallurgist and manager of the Wyandotte Silver Works, Silver Islet; mining expert and surveyor for the Silver Islet Mining Company, of New York; mine in Ontario, Canada, from 1871 to 1875, 1878 to 1879; manager of the Duncan Silver Mine, Boston County; mine at Thunder Bay, Lake Superior, 1875 to 1878; superintendent and metallurgist of the Gage Haganan Smelting Works, Leadville, Colo., and for the Iowa Mining and Smelting Company, of Crested Butte, Gunnison County, Colorado, same parties. Have made complete underground survey of Silver Islet, Ontario. Have examined the iron mine of Leadville as expert for trial, but was not present at trial.

2. See answer number 6, page 2.

3. Think no overlapping claims should be filed, but the right title decided at once as soon as overlapping survey is presented. I own one-twelfth of the Muchichanock location at Leadville, Colo. Were first on the ground and worked continuously; but have been surveyed over several times. In one case the parties were overheard to say all they wanted was a compromise and get what they could. We struck mineral of 22 ounces on first contact, but are sinking to second, so as to hold against the parties that are working on our surface. I don't think the lode laws should apply to Leadville, as there is no lode, but a deposit separated from the porphyry wherever it is found; not always rich in silver, but of the same nature in gangue.

4. I understand the apex of a vein or lode to be the outcrop in the highest geological level, whether this is accidentally higher or lower than some outcrop caused by denudation or slip. This and the dip cannot be determined without fail without work; but in most cases it can be.

5. Not in the few cases which are abnormal.

6. Yes; but have only hearsay knowledge of all the circumstances; and from what I know it has been more the intentional misunderstanding of jumpers or sharpers than real conflict between two *bona-fide* miners.

7. Yes; at Eureka mine, Tintic, Utah.

8. No.

9. Claimed to be; but I don't believe the so-called outcrop is really outcrop of a lode, but the exposure of side of lode.

10. Yes; by the claim being located before the true course of vein was determined or could be.

11. I think not.

12. Such a case is claimed for the Iron Mine *versus* Silver Wave and others, too well known to need explanation; the trouble of all the mine litigation at Leadville being trying to make the peculiar mineral deposit there come under the head of a vein or lode.

13. I think so; but the trouble lies in parties claiming on one side or the other what is very doubtful. They should be made to prove their claim before any injunction could stop the work of the other party.

14. Such a provision should be retained for lodes or veins having a dip of at least 25°, but nothing less should be treated as a lode, except under special cases.

19. Yes; by far the best plan.

20. Yes; by far the best plan.

21. Besides what have been noticed. Would have a provision that whenever a claim is located for the purpose of striking mineral not exposed on surface that claim shall be bounded by vertical planes of side and end lines, no matter what may be struck or claim, vein, lode or deposit. Where a claim is located on mineral outcrop the mineral from which extends in all directions from said outcrop, such claim shall be bounded by vertical planes passing through side and end lines. This shall apply also to beds that may have been faulted so as to present barren rock on one side but the bed has been rediscovered on that side at a different level, a geological fault being clearly proved.

22. Yes; the time should not be less than two summers (as many places are not worked in winter) nor over three years in all.

14. No mineral deposit having a dip less than 25° shall be classed as a lode or vein unless it has two perfect smooth walls beyond dispute and cuts the country rock otherwise than parallel to its bedding, if the rock is sedimentary. The dip of a vein shall be its average. In case of dispute the proof shall lie entirely with the party making the adverse claim, who shall pay in advance to the land office the expense of examination. If the claim is proved good to the proper officer of the land office, he shall then issue an injunction on the other party to stop his work of taking out mineral until the claim is settled. The case shall then be tried, and both parties bring their proofs before a land office court, formed to judge of all mining disputes. Such land office court shall comprise two lawyers and two mining engineers by profession and one land office official *ex officio*. The four first shall be appointed by the President for life. The court shall hold its sessions at or near the place in circuit.

---

*Testimony of N. Armstrong, Glendale, Beaver Head County, Montana.*

N. ARMSTRONG, of Glendale, Beaver Head County, Montana, testified at Butte City, September 28, 1879, as follows:

I have heard the statement of Mr. O'Bannon, and I concur with it, except that I think the mining claims ought to be recorded in the district land offices. I think two years is sufficient to pay up on a placer or lode claim, and I think that the width of claims ought to be defined; that no district should be allowed to restrict the amount of a grant. I think the government allowances should be taken everywhere. I am satisfied with the present United States mining law. I think that the local mining laws ought to be abolished.

---

*Testimony of Orville B. O'Bannon, attorney-at-law, Butte City, Deer Lodge, Montana.*

ORVILLE B. O'BANNON, resident at Deer Lodge, testified at Butte City, September 28, 1879, as follows:

I have been in Montana since June, 1867. Formerly I was register at Helena. I am now a practicing attorney before the district courts in Montana. I have been pretty well over a portion of the Territory. My business has called me all through the country; am conversant with the public lands and the land system. I think that the western portion of the Territory one-sixteenth of it can be irrigated. One-fifth of the lands in the western portion is timber.

Montana is hardly an agricultural country; it is a pasturage, timber, and mineral country; about three-fourths pasture. The future wealth of Montana will be mineral and pasturage. I think that some law ought to be passed as soon as possible by which the title to the timber land should pass from the government to the individual. I do not think the government will ever be able to protect the timber lands; private ownership will do it, and I would put the jurisdiction of the timber in the hands of the register and receiver of the district land offices.

Some classification should be made of the land, and the amount sold should be based upon that classification. I would sell it in tracts of 40 to 320 acres, and I would prefer actual settlers to outsiders, and I would limit the rights of persons to one entry. I would charge according to the classification as to the amount entered. This classification should be made by the deputy surveyor, under the direction of the surveyor.

general, and subject to approval by the inspector of classification. In mineral localities I would sell the timber subject to the mineral rights; outside of the mineral rights I would sell it absolutely. I would sell a miner the timber on the top of his location, and would put the records of the mining claims in the possession of the county recorder. The title is tried at the county seat, and let the record be there also. If the records are destroyed let us do as we do in all similar cases, taking the most reliable testimony that can be obtained. I think that in all cases of actual possession of a mine or a mining claim such possession should be stated in the application before a miner is allowed to make an entry. I know cases of this kind where the man who originally owned a mine was compelled to make adverse filing on his own claim, because of its being claimed by some other person. I do not think it is the intention of the law to permit a man to file on a claim until he is in actual possession of it. That is the law now. I am in favor of a law to make claimants pay upon any sort of mining claim. I would limit the time under forfeiture. I think the size of the ground for dumpage and mills should be increased. Many men are compelled to beat around the bush in order to obtain sufficient ground for dumpage and mill-sites. I think all mining recorders' districts ought to be abolished, and that only one general United States law should be the governing law. I think all mining grounds should be settled upon before any patents issue. They are supposed to do so now, but they do not. I think there should be an inspector for all these surveys, after they are made and before the parties doing the work are paid. I think the classification of the mineral land can be done better. Lands which are now called mineral are non-mineral, and settlers are put to the expense of proving the non-mineral character of such lands. I think in case of any doubt whatever let them go into the mineral classification, but if some method could be provided wherein all settlers in any township or any given part of a township could come, and in some cheap and easy method make one publication in order to prove the non-mineral character of the land, it would be well; and when it is once declared non-mineral they could all file on it as such.

There are lands in the center of Deer Lodge Valley where there is no showing of mineral whatever. They are withdrawn from the market because they are classed as mineral land.

The eastern portion of townships 614 and 714 near Phillipsburg is mineral, but it is settled upon as agricultural. This has got in a measure to be obviated by having a better class of men for deputy surveyors.

I have observed the survey of land closely, and favor the retention of the rectangular system to survey the land. I would suggest that better monuments be used, because the stakes are often quickly destroyed. I will cite a case of bad surveying. On June 15, 1872, I preferred charges to the surveyor-general, Mr. Blaine, against the deputy surveyor, who had executed the agricultural surveys in Deer Lodge and in Missoula Counties. There was no allowance of the convergence of the meridians on that section line between townships 8 and 9 north, and range 9 west. There is an offset of three or four chains where it should have been half a mile or more. It is shown on the map that Deer Lodge River goes down township 8 north a quarter of a mile east where it enters township 9 north. The Deer Lodge River actually goes out of township 9 north, one-third of a mile south of where it enters 9 north, 10 west. The Little Blackfoot River comes within the first-named chain half a mile south of where it enters the last named township. I cited other small discrepancies to the surveyor-general, charging there was good land to the topography in township 9 north, 9 west, and in 9 north and 8 west, 9 north and 13 west, but no attention was paid by the surveyor-general.

Then I preferred charges against the surveyor-general to the Land Office at Washington, and they were returned with an indorsement that the charges were not worthy of consideration. This indorsement was put on by Mr. Dallas, of the Bureau of Topographical Surveys. Mr. Curtis requested me to wait until Mr. Drummond returned, and he promised that a general inspector would be sent out, but it was not done. Three years ago I asked why this had not been done, the reply was the only man who was reliable enough to send was then in Oregon. I then carried the matter to Helena, but pending an investigation Mr. Blaine resigned and nothing was done.

The settlers in this township were never able to make their filings upon this land, and at my advice most of them never entered their lands. There is evidence from citizens that they did not know where their lands were, owing to the bad condition of the surveys. Only one man of those who had filed on the land found himself actually in possession of the land he intended to occupy. He was one out of 13 settlers. This survey was made by William H. Baker, October of '70, and subdivided in December, '70. All the surveys made now by Mr. De Lacy are good, and I think they are all right.

The monuments of surveys ought to be of permanent character. The laws and regulations and instructions now demand that, but the laws are not complied with. If the surveying instructions are complied with, that is sufficient. I think it will be a

good idea to place at every township corner a permanent monument of some kind. Mr. Kellogg, United States deputy surveyor, told me that he had run twelve miles before he found a corner. The settlers along the line of the river in this township, 9 or 10 west, paid him \$300 to find their corners for them.

Question. What effect has irrigation upon the bearing capacity of the land?—  
 Answer. It depends upon the situation, measurably, whether the capacity of the land is increased or decreased by irrigation. Where there is a fine loam, with clay and gravelly subsoil, it is ultimately injurious; where there is a deep loam and clay subsoil it is good. It takes less water where the soil is good. Water rights are held almost exclusively by possessory title. I do not know exactly what the law is in respect to water rights. I think it is very chaotic both as to mining and agricultural. About two-thirds of the water can yet be applied to the irrigation of land by a system of dams in the mountains. By such a system the capacity can be at least doubled. I think there ought to be some general law passed by Congress in relation to the matter of irrigating and every facility offered the citizens for the development of irrigation, but I am not in favor of a national system of irrigation. I think some law ought to be passed by which title to the pasturage lands can be acquired on easy, nominal terms. Mr. Concourse, a large cattle owner, says that on an average the pasturage lands in Deer Lodge County are worth to him \$1.25 per acre. He and his brother entered 640 acres under the desert-land act, and if there was any law by which he could do it he says he would enter 5,000 acres of land—that is, of land adjacent to that he now possesses, which I think is better than the average. I think the entry of one entire section ought to be allowed for pasture purposes. I do not believe in selling these lands in unlimited quantities, because I think the pre-emption and homestead entries should be continued for some time longer. I hardly think this land is worth for pasturage purposes \$1.25 per acre, but if I had the money I think I could find a body of contiguous land, 10,000 acres in extent, of what is called arid land, in Deer Lodge County, that I would pay \$1.25 for.

Under the infamous railroad grant we are cut down to each alternate section at a cost of \$2.50 per acre, and that makes it \$400 for a homestead, and the fees to make non-mineral proof, &c.

Agricultural entries in each case cost a man about \$70 or \$80. I think the publication of notice is the most ridiculous thing in the world. In the notices there is no time given when the claim is to be made, so that it is really no notice to a man to issue a protest. I think a man should have a right to protest after the entry is made, before proving it and before the patent is issued. I think one land office at the capital (of the State or Territory) would be sufficient, with some modifications. The proving might be done somewhere else, except the pre-emption affidavits. I think a man ought to be allowed to prove up without going to the land office.

The attention of Congress should be called to our terrible situation in regard to the Northern Pacific Railroad claims here. For ten years one-half of our land has been withheld from the market, and our citizens have been compelled to pay double prices for the remainder. Eighteen sections are given to the railroad and two for school purposes, which leaves only sixteen sections in a township open to pre-emption and settlement. This works great detriment to the settlers, and a person filing a declaratory statement cannot cross a township section line because of the railroad grant. It will be better if all railroad land were shifted to one side of the railroad, so as to make the government and the railroad lands each contiguous. If the charter of the Northern Pacific Railroad is extended, it should be upon the condition that this land pass into the charge of registers and receivers, and let them allow cash entries on these lands at a price not to exceed \$2.50 per acre, and when the railroad has complied with their promises let the money realized from the sale on these lands be given to the railroad.

I think there ought to be more expedition in the issue of patents, both in mineral and agricultural claims. I think the fees of the surveyor-general's office are too large, as a man filing on timber or agricultural claims would not have to pay so much. I do not think that mining claims should be excepted. There ought to be something definite. I would suggest that the money be refunded to the claimants when they obtain their patents for mining claims.

#### *Testimony of John Caplice, Butte City, Deer Lodge, Mont.*

JOHN CAPLICE, of Butte City, Mont., testified, September 28, 1879, as follows:

I have heard the previous statement of Mr. O'Bannon, and concur, except that I favor the recording of mining claims in the district land office, and think two years a sufficient limit for paying up.

Concerning the old claims I find injustice in the present law. My mining difficulty

They could administer the laws better than an outside agent. There is a much larger scope of this country that is capable of agriculture than is supposed. My impression when I came here was that a very small part of it was fit for agriculture; but the prospectors in the south and west are showing up considerable areas of arable land.

Q. How would you prevent this land from being taken up as pasturage land at a low price?—A. I would reserve the arable portion from private sale and dispose of it under the homestead law. I would abolish the pre-emption law.

Q. Why?—A. Because the homestead law has a pre-emption feature in it already.

Q. How could you classify the land?—A. That could be done by the deputy surveyor and the geologist, who should be appointed to go along to classify the land.

Q. And how could you determine just what was irrigable land?—A. Wherever there was water accessible the surveyor would know that so much of the land near by was irrigable.

Q. And how could you make a practical division so that these gentlemen here by looking on this map would know what is irrigable and what is pasturage?—A. From the information collected by the surveyor in making his plats I would have the draughtsman simply note—say, here is a section—I would have him note that this 40 acres is arable, at \$1.25 per acre; this 40 acres is timber, of commercial value, so much per acre for that; and that 40 acres is, perhaps, grazing land, and another 80 acres may be arid or be mesa land. In subdividing they run around the entire section, and they can form a pretty good opinion of the entire section from the observations they then make.

Q. You would have this classification made by the deputy surveyor and the geologist appointed to go along with him, who would measure the streams, and determine how much water there was in them annually, and then mark the limits to where the water could be carried?—A. I think he could determine that approximately by his eye. If he made a mistake and it is not arable, still I should classify it as arable, for there is a probability of its being so. I require them to measure the streams now, and their notes show everything—the depth, height, &c.

Q. Suppose it should turn out that there is not water enough for all this land that you have determined to be irrigable, and you sell it to citizens of the United States and it turns out afterward that there is not enough water?—A. Well, it is their lookout. If they buy something and pay \$1.25 for it, and it does not turn out as they expected, it is their lookout.

Q. But you classify the several pieces of land for the citizen?—A. The citizen should go and make an examination beforehand.

Q. If the government undertakes to sell a piece of land as irrigable the government ought to know whether it is irrigable or not, and it takes the money of the citizen under the supposition that it is irrigable, does it not?—A. They do under this system.

Q. Suppose a man buys land low down on the stream as irrigable land, and pays for it; along comes another man who buys land higher up and takes all the water. How would you arrange that?—A. That is something I have never thought of.

Q. What is your present law of water rights here? Does the first man who occupies the land take all the water, returning such as he does not need to the stream again?—A. Yes; that is the local law here, I think.

Q. Do you think that there will be any difficulty in adjusting these conflicting interests and conflicting rights?—A. There might be eventually, perhaps, something of that kind. You cannot have any general law that will not operate harshly in some instances. When the government makes this classification of land I go down there to make my settlement near the mouth of a stream or valley. I take my chances of settlers coming in above me and absorbing a good portion of the water. That is something I don't think you can regulate. You can only have a general rule, that the water shall not be wasted.

Q. Why should the government not sell a man the water right, when it sells him 40 acres of irrigable land? It is known how much water is wanted for a certain quantity of land. Why not let this water right run with this land forever? If the government finds that it has not enough water in the stream, let them stop selling the land as irrigable land, and sell the balance as pasturage land.—A. Perhaps that would be a good idea. I have not given that subject any consideration, and can only jump at a conclusion.

Q. Do you think a general system of irrigation ditches could be constructed in this Territory with profit?—A. I think they could in some sections—on the Pecos and Rio Grande Rivers. There is an immense area that can be irrigated there.

Q. Does it destroy the land, or improve it?—A. Irrigation improves the land; it enriches the soil.

Q. Does it increase or destroy the growing capacity of the land, year by year?—A. That I cannot say. They have raised here, for years and years, crops, without fail and without fertilization.

Q. Don't the grazing capacity of the land decrease, year by year?—A. That depends on the size of the herd.

assessing these lands, to make them pay at least a tax on the land on a basis of two dollars and one-half an acre, so that they would either perfect the title or abandon it, and thus give some one else a chance. Unless they are made to pay in some way or other they will hold it for an indefinite time. I know of two cases where tracts of 160 acres each were taken up under applications for placer claims and used for agricultural purposes. They were not mineral; there was no mineral on it at all. If they had made application for these lands as agricultural lands they would have had to prove up, which they did not have to do in their placer-claims application.

I think all mineral claims should be filed in the district land office, and the record be first made there; that is the very best place where it could be done. The title would then be always perfect and could not be manipulated. I believe in square locations.

### *Testimony of William Davenport.*

**WILLIAM DAVENPORT** testified, September 27, 1879, at Helena, Mont., as follows:

I have lived here since 1864. I am engaged in the sheep and cattle business. My herds are in the Sun River range, about 70 miles from here.

As to the destruction of the grass by sheep, it all depends upon how close they are compelled to feed. If they are limited in their range, they feed the grass so close that they kill it. I have from twenty to twenty-five hundred cattle and from seven to ten thousand sheep.

As to the quantity of land it will take to feed a beef, I cannot say accurately from my knowledge on that point; but I think it will take to feed a beef about 30 acres, and I think five sheep are equal to one beef in the matter of feeding. I have never made any particular observation in regard to the matter.

The way we arrange our grazing is this: we bring our sheep up on the home range until the winter season is over, and we leave it as soon as the grass comes in the spring, and then we shift the range. Our sheep graze, say, over six miles over our winter range; that would make about six miles square that our sheep graze over; that is, a herd of 3,000 graze over these six miles square. It takes about that amount of grazing land to keep these sheep well. We feed them hay sometimes. I have cattle, but do not keep the cattle and sheep together. If I confined my sheep more than that, it would destroy the grass in time, and if you keep the sheep on that range year in and year out it would destroy the grass. That is not so much the case with regard to cattle, and this is the argument for large ranges.

There are some conflicts between cattle and sheep men, and eventually they will prove very disagreeable.

I think these grazing lands ought to be sold and a title given to the stock owner. I would sell it for ten cents per acre, and give a man all he wanted for his cattle herd. I would sell the land in proportion to the amount of stock a man owned.

I think the actual settler ought to be protected, and that this land ought to be divided up into some kind of shape that would protect the small cattle owners. I think it would be well to have a pasturage homestead law. There is just this point in regard to the agricultural and grazing lands. There is a very small proportion of land in this Territory that is suitable for agricultural purposes. There is ground enough, but there is no water to irrigate it with.

There is an immense amount of grazing land in this country. The whole Territory is covered with grass. These lands are not fit for anything but grazing. I think the government would be benefited and the people themselves by acquiring title, so that they could make permanent homes in the Territory. The government would then derive some revenue from the sale of this land, and the result would be a permanent healthy growth of the country.

The greatest need we have here is people.

I have no idea how many cattle there are in the Territory, but I think that the wealth of Montana will consist in the future of the stock-raising interest.

My opinion at present is that agricultural pursuits, raising grain, &c., do not pay in this Territory. I think if these grazing lands could be settled up that then there would be consumers for the products of the agriculturist. I think the rainfall is increasing slightly here, but not enough to amount to anything. I don't believe in waiting for any climatic changes to settle these matters.

I cannot say anything about the timber lands, for I do not know anything about them. I think the wealth of the country lies in the bunch-grass. There is no real water system; it is too chaotic. All the lands used by stockmen are held by common consent.

*Testimony of A. J. Davis, Butte City, Deer Lodge, Mont.*

A. J. DAVIS testified at Butte City, September 29, as follows:

I have lived in the Territory since 1864, off and on. I have lived in several counties. I think the mineral and pasturage interests are the two greatest interests of the Territory.

Agriculture, so far as the home market is concerned, is of course of considerable interest; but when we get two railroads here to ship products to the East, we will find we cannot compete with other States and Territories.

I do not think more than one-twentieth of the Territory could be irrigated; probably one-tenth is timber, but in the eastern portion of Montana timber is very scarce, while there are valleys which are remarkably heavy with timber. I think these timber lands ought to be held by the government, and allow every person to go and use the timber for domestic purposes.

I would allow a person to use the timber for domestic purposes that would tend to the improvement of the country, without purchasing it, and without licensing people to go on the timber land.

If there is to be any jurisdiction over the timber lands, I think the register and receiver would be the person to have that jurisdiction. If the government concludes to sell these lands, I would sell them in tracts not to exceed 160 acres, without it was to parties who consumed large amounts of timber in the way of mining interests and saw-mills.

My idea is to protect the actual settler here. In selling the timber the price should be regulated by the quantity, and the price should hardly exceed \$2.50 per acre. Many portions of it would not be worth more than fifty cents per acre.

I do not think there is much destruction of the timber now by fire. Fire is the worst cause of its destruction. There is less fire now than formerly. I think one-half the timber could be trimmed out with more profit to the remainder. I think if the fires are kept out of the timber it will grow, and it would be a good idea for the government to retain every alternate section if they propose to sell it, though I think it would be the better way to let the timber remain as it is. If it were all cut off I think it would grow again large enough for mining and farming purposes, such as fences, &c., in forty or fifty years.

I have noticed the rainfall, and I think it has increased. I do not think the openness of the climate has increased; I think it has been milder for the last few years.

The great body of the water comes here in the spring, and for the last few years there has been at a season of the year that has enabled us to raise crops without irrigation. We have had in the last three springs a great deal of rain. In many instances the rain has fallen at the time needed for the raising of crops. I think it would be better if we had some national law by which we could take out large ditches, and the government should offer a consideration for the encouragement of this industry. In Jefferson County, and a portion of Lewis and Clarke Counties, there is a large portion of land, some of it very valuable bench land, that might be irrigated by making extensive canals. It depends upon the soil whether the water will destroy the quality of it. If it is a subsoil, it injures it; if it is a clay, the water is held. I do not think it is any use to base any hopes upon an increase of water in Montana.

Four-fifths of the Territory is properly arid land, and for men of limited capital probably the pasturage homestead may be a benefit; but for persons of large capital who have 10,000 head of cattle that kind of a homestead would be of no use. At the same time a man who has a large herd of cattle wants some protection, and I would not sell these lands. I think the government had better hold them to lease them.

Give a man a right to use this land in proportion to the cattle he has, for a term of years with the privilege of renewing that lease.

If these lands were sold, I think either from 8 to 10 cents per acre would be an ample price for them. Of course there are some choice spots that would be worth more.

It will take on an average 20 acres of this land to sustain one beef, and in a very few years if you pasture this bunch-grass closely it will decrease. The seeds are eaten off and the growth is retarded. If a man has a large tract of land he could increase his range by moving his cattle at stated times from place to place, so as to prevent his bulls serving his neighbor's cattle, and the quality of beef would be improved. As his herds increased his land could be increased. Montana is not one-tenth stocked with cattle yet. Something should be done in this matter before the people begin to come in rapidly, and I think the sooner it is settled the better, and the mining districts are a convenience to the miners. It saves them the traveling, while it would be safer to make the final record in the district land office, because if a copy of the application or registration is forwarded to Washington if the records are destroyed here they have got them there. I understand that the records of the Summit Valley mining district, in which are situated all the mines of Butte, are all destroyed. They were

kept by a mining recorder in the mining district, and I understand that there is a number of mining patents in Washington that will not issue until these records are found. I think the present United States law in regard to surveys is sufficient. There is one amendment I think would be well. Where two claims are adjoining and parallel there are sometimes little fractions between the two mines. If one party has secured his patent or made his application I think the second party ought to have the right to come up to the first party's lines and take in the small fragment. The government sells that land, and it has often been a channel of great annoyance. The present expense of getting a patent is very high. The miner pays \$5 per acre for his mine, while the agriculturist pays but \$1.25. The latter has also his land surveyed for him and he pays nothing for his application, while the miner pays \$30 to the surveyor-general, and the other charges are also very high. It costs in the neighborhood of \$300 to pay for the survey and make his proof. I think the cost of survey, wherever it is done, should be deducted from the cost of the land, and I think there should be more deputy mineral surveyors. Every district of any importance should have one. These mineral surveys are very fairly done.

C. T. MEADOR. I would like to make a remark concerning square locations. The square-location proposition would be suicidal. If the government would allow us to take as large an amount of land as the Spaniards did, we might be willing to take the square location; but most of the improved mines in the Territory would go out of their side lines at 1,200 feet. That is the case with all of the best mines at Trap Hill.

JOHN CAPLICE. And if you make a square location you destroy the mining interest. Just as a man puts up expensive machinery he runs out of his side lines, and he is cut off by some other man who pre-empta a claim next to him. Take the Alice mine, for instance; you go down that mine and you will see long parallel veins or seams of ore which are 50 feet apart and all of the same size. Under the square location a man might be entitled to a dozen mines at once.

A. J. DAVIS. The present law seems to be a very good one, with one exception. I think we ought to be entitled to follow the dip of the vein, but the law as regards spurs and angles ought to be the same as it was under the old Mexican law, which cut off the spurs and angles. I think the law ought to go back to what it was before. The old law was better in that respect than the new one. If that were done, I think our law would be as good as there is any necessity for. I think the present law ought to be modified in regard to mill-sites. Under the present law you cannot take up a mill-site without proving it to be non-mineral. That is almost impossible. Take the land here for over ten miles and you will find some mineral deposits throughout the country. You cannot go anywhere, scarcely, without finding mineral of some kind, although it may be in very small quantities. Hence you cannot swear it is non-mineral. I think the only requirement the government should make is that there shall be no mineral of any value on it. I think there should be more than 5 or 10 acres—there should be 40 or 50 acres—for this reason: if a man is confined to 5 acres, that is not enough to stack his ore on and build his warehouses, &c. If you have 40 acres you can place your buildings at proper intervals and have a place for your tailings, &c., and keep other people off. If all such subterranean rights were retained by the government, it would remedy the defect. Of course in mining underneath such land it must be done subject to the vested rights of the mill owner. I think there ought to be a period fixed by law within which the miners should be compelled to pay up on their placer or lode claims. I should fix that period at two years. A large amount of valuable land is simply held by speculators, without working, and this is much to the detriment of the country. This sort of thing has greatly injured Montana.

C. CLARKE. If a man pays up for his mine, I do not think he should be compelled to "represent." There was a decision of the courts on that point, but it is generally understood with men who have valuable property that rather than run any chances they had better go on representing. The law should be so amended that when a man pays for his land and gets a receipt from the register and receiver, that such receipt should be as final as if it were a patent, and he should not be compelled to go on representing afterwards. The law is ambiguous as it is, and while the officials decide one way the courts decide another. The miner should not be compelled to take any chances on it. The mineral law says that there shall be representation until the patent is issued.

A. J. DAVIS. I think that there is a great deal of unnecessary delay in patenting. I think these patents should be issued sooner, and I think they ought to issue then without requiring the payment of \$25.

C. P. MEADOR. If I send a fee to a lawyer in Washington I get a patent right away, but if you do not, you wait two or three years.

A. J. DAVIS. A gentleman told me that he followed his papers to Washington and got there just after the papers arrived, and in twenty-four hours he secured a patent.

C. CLARK. There is a patent in the office at Helena that has only just arrived after two years, and yet the papers were all sent in properly and straight.

There is another point in connection with this matter of mineral patents. The Land Office has decided that a claimant can't make continuous proof by an attorney in far-

I was away last summer and my brother, who was my attorney in fact, transacted some mineral business for me, but they returned all the papers to me to be corrected. After the location has been made by the person himself, all other matters should be allowed to be transacted by the attorney in fact.

A. J. DAVIS. I see no reason why the Commissioner of the General Land Office should require three certified copies of location, and I think the registers and receivers of the local land offices and the surveyor-general should have seals to put upon their official papers.

Question. What is the law concerning the water rights here?—Answer. I think there is a statute concerning the water rights but it does not amount to much.

I think all contests up to the point of obtaining patent should be heard and decided in the district land office. This would be a protection to the poor man. There is no reason why mineral contests should not be decided in the district land offices, where homestead and pre-emption contests are settled. Of course this should not destroy the right of appeal from the decision of the respective officers.

The yield of the camp has been between two and three millions since it was struck and I think averages about \$125,000 a month; I think it could be increased to about a million a month. All the titles of this camp which have been recorded in the office of the mining recorder have been lost. I have to send forty miles to the mining recorder's office and it would make no difference to me if the records were kept in the district land offices, I would just as lief send to Helena, Mont. Many mineral claims have been filed on fifteen or twenty times. This mineral recorder's office does not prevent this, but the district office would, for the government officers would not allow one filing to be made until the previous one had been voided.

The following gentlemen being present concurred in the statement of Mr. Davis: C. F. Meador, mine owner; N. Armstrong, mine owner; C. Clarke, mine superintendent; W. A. Clarke, mine owner; D. M. Evans, superintendent Lexington Mine; P. Largy, mine owner; J. Rosenthal, mine owner, and J. Caplice.

#### *Testimony of Ralston Deegan.*

RALSTON DEEGAN, Helena, Mont., testified, September 25, 1879, as follows:

I have lived here since 1866. I am in the cattle and stock raising business. They range in the Spokane range of mountains. I think it will take back in the mountain ranges 20 acres, and in the lowlands it will take 30 acres to raise a beef.

The water rights here are pretty well taken up. In this vicinity it is overstocked, but in the northern counties it is not overstocked, and this is a very good sheep country. I think that about five sheep will equal one beef. This I consider a fair average. The ranges decrease by feeding, because the cattle do not permit the grass to head and the seed to fill. We have here buffalo grass, and blue joint and red top.

If a man were permitted to own his land, he, either by herders or actual fencing, could then guard his ground and sow grass. I think the wild grasses are much the best and strongest for cattle, but if cattle could be allowed to rotate I think it would be better for men to own their own land. I think these grazing lands ought to be sold at a low figure. I like the pasturage homestead idea very much for the small dealers, but I think the larger ones ought to be allowed to purchase in excess of the pasturage homestead, in proportion to the amount of cattle they own. I would allow the actual settlers to have the preference. I think in the hills there is a portion of the land which is grazable and on some land there is no grazing at all, say one-third of it. I would take 10,000 acres at 10 cents per acre; that is as much as I would want in this country. This country is only fit for pasturage, mining, and timbering purposes. It will never be anything but a grazing country. A country that requires irrigation will never be a very extensive agricultural country.

Wheat is sold here for 50 cents per bushel and sometimes for less. There is no money here in agriculture; you take new land here and you raise a crop for one or two years, and then it is all played out. I took up a claim here last summer; it is entirely surrounded by water. It is so low that three months in the year the mosquitoes and flies are so bad that one cannot live there, and in such a place as that you cannot raise anything—not even a potato. It is only fit to cut hay off of. I filed a homestead on it, and I think I should be allowed to make final entry; but the land office ruled that as I had not lived on it five years I cannot make final entry, although everything is all right. This land was not surveyed but I had it surveyed at my own expense.

*Testimony of C. Edwards, Bozeman, Gallatin County, Mont.*

1. C. Edwards, Bozeman, Gallatin County, Montana, breeder of sheep, cattle, hogs and poultry; am a farmer.
2. More than fifteen years.
3. Have acquired title to 320 acres, 160 each by pre-emption and homestead.
4. None aside from my observation in this Territory.
5. Don't think I understand the purport of the question. Final proof is made in conformity with the law under which the land may have been entered, and from one to two years may elapse before the applicant receives a patent from the General Land Office; the distance necessary for applicants and witnesses to travel from some sections to the land office in this Territory makes the expenses quite heavy.
6. Think in some instances if applicants and witnesses had been more conscientious patents could not have been obtained. Cannot suggest any alteration of the homestead or pre-emption laws that would remedy such abuses. Think the desert-land act objectionable in every respect, and believe that the best interests of Montana demand its immediate repeal as far as it affects this Territory, for the reason that any land that can be taken in conformity with the desert-land act is equally available for pre-emption and homestead entry.
7. The lands of Montana may be divided into timbered lands, agricultural, pastoral and mineral.
8. Do not feel competent to offer any suggestions.
9. The present system of subdividing land into 40-acre lots is in my opinion as good as could be adopted. The requirement of non-mineral-character proofs in some sections makes unnecessary expense to the claimant, but I could not suggest a remedy.
10. I don't think the present homestead and pre-emption laws can be improved, and I am decidedly of the opinion that the best interests of the masses of the people and of the general government are best subserved by restricting the acquisition of titles to public lands to the present homestead law, or some laws similar in character, for the reason that in my opinion the parceling out of the public lands in a manner that will afford good homes to the largest number of families is directly conducive to the best interests of the nation. Montana has large tracts of land that are now used only for pasturage that in the near future will no doubt be converted into homes by thrifty, enterprising settlers, who will be content to pasture stock during the summer on free pasturage and feed them during the winter; and if these tracts of country are held by the general government until they are taken under existing pre-emption and homestead laws, they will make of Montana a more populous and wealthy State and yield a greater revenue to the national Treasury than they possibly can if disposed of in any other way.

## AGRICULTURE.

1. The climate is considered arid, but more water falls here than in many portions of the plains and mountain counties of the West. Rainfall in Montana ranges from 21 inches to 25 inches. The average rainfall of the greater portion of the Territory is, as near as I can learn from the most reliable data, between 23 and 24 inches, and has never fallen below 21 inches during the last twelve years; this includes the snowfall, and the relative proportions of each I am not able to state.
2. We have rain in April, May, June, July—the greater portion in May and June. There is seldom a year that rain falls sufficient in July to fill spring wheat; but the opinion is growing in favor that fall wheat, sowed in August, will yield big crops on the most of our bench lands without irrigation.
3. Comparatively speaking a very small proportion of the entire area.
4. It would be difficult to state with any degree of accuracy.
5. Wheat, oats, barley, corn in some sections, potatoes, onions, cabbage, beets, turnips, and a large variety of vegetables in general.
6. The amount actually necessary will vary in accordance with the lay of the land and the character of the soil. I have never studied the subject closely enough to define an answer in inches. I am of the opinion, however, that the average farmer of Montana at present uses less than "a cubic foot per second" (see report of Maj. J. W. Powell in charge of United States Geographical and Geological Survey of Rocky Mountain Regions) in a great many cases.
7. Tributaries of the Missouri and the Marias, and the tributaries of the Columbia that rise in Montana.
8. Have raised crops by irrigation for fifteen years in Montana; don't think the soil is injured by irrigation. Our highest farms are about 5,200 feet above the sea.
9. Ordinarily all of the water that runs into the field in the ditches stays there until it goes out by seepage into underground channels or by evaporation. The laws of Montana would seem to grant to the appropriator of the soil for agricultural purposes the use of water for irrigating, to make such land available for the purpose of agriculture.

to the full extent thereof, giving preference in all cases to the priority of the claim. I don't think I comprehend what you mean by "waste" water.

10. In the sections of the Territory where farming is most extensively carried on the water of the smaller streams, which is most easily utilized for irrigating purposes, has generally been appropriated by settlers to its full capacity. Governed at first by local laws, which have since been embodied into statute law.

12. Can't say. Much of the land now used only for pasturage in my opinion, which is based upon practical experiment, will raise good crops of fall wheat without irrigation by using a subsoil plow.

13. Not advisable at present. Montana is too new, and too small a part of the lands that will make good homes for the masses of the people have yet been taken.

14. No, it is not.

15. Some stockmen with whom I have discussed this subject think that it will require about 12 acres. But we have never yet been compelled to give this subject much thought on account of the vast amount of grass and comparatively few stock. This applies to Montana at large.

16. Stock cattle are worth about \$14 per head, and it is estimated that the average return from a herd is about 25 per cent. per annum.

18. Diminished.

19. No. In some sections they can be confined. Any range, as long as it is a good winter range, might as well be fenced as otherwise.

20. Can't see that it would.

21. The Gallatin and Yellowstone Rivers and tributaries.

22. About eight or ten.

23. Diminished.

24. Yes.

26. About 20,000. Can't say about cattle; they are not herded. From 15 head to 4,000 head in a herd.

27. That the government disposes of its lands only under the present homestead and pre-emption laws, which now nets a clean profit of 9.3 per acre clear of all expenses (New York Semi-Weekly Tribune, November 18, 1879, page 10), and provides full and ample protection to every citizen in the peaceful enjoyment of life and property. This policy adopted and rigidly pursued will develop the mountain wilds of Montana into a wealthy and populous State.

28. Yes, a great deal.

#### TIMBER.

1. So much that it is hard to say—fir, pine, spruce.

2. None worth mentioning.

3. In the most of the valleys in Montana a very narrow strip of timber along the foot of the mountains is all that is any way accessible; a few acres of this might be sold, but, in my opinion, would have a tendency to retard the settlement of the valleys, except perhaps in some portions of the Missoula Valley. I cannot suggest any plan by which the prospects of the general government would be brightened in the sale of timber land in any of the inland mountain Territories.

4. I would let them alone just as they are.

5. So far as I have noticed (my observation is not limited on this point) there is a second growth, of the same character as has been chopped or burned off; its growth varies in different lands.

6. Forest fires are almost unknown since the whites took possession of Montana. My own inclinations are to the belief that they are the result of carelessness by campers either whites or Indians, for the most part, although I have no doubt that in some instances they are caused by lightning.

7. There are no railroads in this Territory for domestic use. The difficulty of getting timber out of the mountains is such that generally what is not fit for building or fencing is used for fire-wood, and as far as I have observed I feel safe in saying that there is less waste of timber here than in some of the States.

8. We go and cut timber when we want it wherever we find it to suit our purpose best; I have known of very few instances of timber being cut to hold it, and that has been in an excitement at a new mining camp, but in no instance to any great extent. Timber once felled is supposed to belong to the party who chopped it, and his rights are generally respected until it would seem evident that he has abandoned it.

9. Don't think any benefit would be derived from it at present.

C. EDWARDS,  
Bozeman, Mont.

*Testimony of Wesley P. Emory, miner, Butte City, Deer Lodge County, Mont.**To Public Land Commission:*

I beg leave to submit the following answers to some of the questions propounded by you. Questions answered under the different headings will be named and numbered.

1. Name, Wesley P. Emory; residence, Butte City, Deer Lodge County, Mont.: occupation, miner.
2. County, five years; Territory, sixteen years.
3. Yes. A quartz mine. Under the United States mining laws.
4. What I have seen and the experience of others.
5. From my own knowledge and the actual experience of others, from three months to four years for an uncontested claim for quartz or placer, depending on whether an attorney is paid to hurry up the claim at the General Land Office at Washington. For a contested claim the time depends a good deal on the courts and is indefinite. For a quartz claim on surveyed land, from \$140 to \$175 and the entry fee of \$5 per acre for the amount applied for. For placer on unsurveyed land, same as quartz on surveyed land and entry fee. For placer on surveyed land by legal subdivisions, \$5 and entry fee of \$2.50 per acre for the amount applied for.
6. Yes. The desert-land law should be repealed and the lands only disposed of to actual settlers; under it the best land in the country is being taken up, both grazing and hay land, and the land is not settled on at all in most cases, and the result is a large tract of land held for speculation. In all cases that have come under my observation so far, small streams of water which flows naturally through the land is diverted from the stream for a few rods and application made for patent as reclaimed desert land.
7. Valleys, bench lands or foot-hills, and mountains. Valleys are farming lands; foot-hills, grazing and mineral; mountains, timber and mineral.
8. Agricultural are easily classed. Mineral land can only be classed by a thorough scientific examination wherein pick and shovel must be used.
9. Timber land should be surveyed in small tracts, and the quality and quantity of timber reported on by the surveyor or some person appointed for the purpose, and the timber sold in tracts not exceeding 20 acres; but the land on which the timber grows should be reserved to the United States, with the privilege for miners to prospect or mine on the same, and, after a period not exceeding fifteen years, the timber left standing should again vest in the United States and should never be sold again except to miners who shall be in actual possession of the ground and have a *bona-fide* and paying mine. Or perhaps a better plan would be to charge a stumpage that should bring the United States an average of not less than \$2.50 per acre for the timber land from which they cut the timber, and the title still be held by the United States; and in view of the fact that timber that will make lumber is very scarce in some sections of the country, saw-mills should be charged by the thousand feet. But the plan that most of the people would prefer is for the law to remain just as it is. Pasture land, if surveyed and sold or offered, would be slow sale except in the vicinity of some prosperous town, and if sold in any other sections the result would be to shut out poor people who were unable to purchase large tracts of land so they could scarcely keep a cow, while large stock dealers, who would be the principal purchasers, would require from six to twenty thousand acres to accommodate their vast herds, and I think the system would result disastrously to the speedy development of the Territory. No, I don't think the system would be a judicious one, and as to leasing them, I believe it would be worse than their sale. With the desert-land law repealed, at least so far as Montana is concerned, I believe the present land-parceling system is as good as can be desired, except in regard to placer and quartz, of which I shall speak further on; but will take the liberty to state here that before the government commenced to survey and sell the mineral lands the country was more prosperous, as about two-thirds of the mining claims are shut down as soon as patented.
10. I know of no better method than the one now in use, except as stated above, and in regard to quartz and placer, of which I shall speak under that head.

## AGRICULTURE.

1. Climate dry and cool in summer. Rainfall from April to November from 4 to 8 inches. Seasons, spring from April to July, pretty well mixed with snow and icicles sometimes. Summer from July to September, and fall lasts until about the 1st of December. First snows usually about September 15th. Snowfall in winter from 4 to 14 in the lower valleys and 2 to 7 feet in the higher mountains.
2. May and June. Irrigation season from May to September. Most need of irrigation, July.
3. None worth making a note of.
4. About one-tenth.

5. All except hay.

7. Mountain streams fed by springs of never-failing water. Supply good, but a little expense must be incurred in some cases to raise some of the larger streams.

8. The fertility of the soil is not injured only when washed away, but is improved and changed. Good crops of wheat, oats, barley, and potatoes, and all kinds of garden produce except vines, such as tomatoes, melons, squash, &c., which will not grow here at an altitude of 5,800 above the sea.

12. About one-tenth.

13. Impracticable as it requires on an average about 10 acres to keep an animal one year, and in some cases twenty-five would not do it.

14. Not advisable; and if put in market the quantity should be limited.

15. Diminished.

16. No; only their hay land.

20. No.

23. Diminished. The native grasses in this country will not stand much grazing.

24. Cattle will not graze with sheep nor on land where sheep have grazed lately, if left to themselves.

#### TIMBER.

1. About one-half is timber on the west side of the main divide. East of the divide grows less and less down to the plains at the base of the mountains. The character of the timber is mostly a thick growth of small pines growing among the rocks and higher mountains, only fit for fence-poles, log-houses, and fire-wood, and not more than the one-fiftieth part of it on an average is fit for saw-mills. A little very scrubby cedar grows among the more rocky places. Besides this a light growth of cottonwood, birch, quaking asp, and black alder and willows grow along the margin of the streams. The last mentioned five are fit only for wood and shelter for stock, as it is very scrubby and crooked.

2. Cottonwood and quaking asp are the only kinds planted, and must be irrigated; time of growth fifteen to twenty years in this country for a tree five inches in diameter; they are only planted for ornament.

3. I would not dispose of them at all; but if they must be disposed of do it by lease of small tracts, and to prevent monopoly the number of leases to one man should be limited and non-transferable, and in a certain number of years the lease should be canceled, and in view of the scarcity of saw timber in a great many places saw-mills should be allowed to cut where they please and pay stumpage or by the month, according to capacity of the mill. No lease exceeding 40 acres to one person, and only one lease to the same person in the same land district, but allow him to file abandonment papers with the proper officer at the land office, and locate another at any time. But in all cases the mineral and the right to prospect for the same, and mine on the same, should be reserved for any persons who wish to avail themselves of it. Price should be from two to five dollars per acre, according to quantity and quality of timber.

4. Yes; for reasons given under Question 3, to prevent monopoly and give all a chance to acquire land.

5. Yes, if fire is kept out. Variety same as formerly, and takes from ten to fifteen years for a tree five inches in diameter.

6. They are frequently intentional and often the result of carelessness; they are very destructive in dry weather; they might be checked to a certain extent by fine and imprisonment, but the only sure preventive is a greater rainfall.

7. In this country the timber used for mining and building purposes is scarcely wasted, as only a very small portion of the amount of timber growing on a given portion is fit for the purpose. It is only such as is suitable that is taken, and the only waste is a portion of the tops, which is wasted, and much of that is gathered for fire-wood when it gets dry. It is only in the vicinity of large mining camps where there are mills that forests are much destroyed, and even then the timber on the more inaccessible portions is not taken. This place and vicinity consumes about seventy-five cords of wood daily, and this destruction of the forests cannot be prevented without stopping or seriously crippling the mining interests. The survey and sale or lease or a stumpage law will not stop these inroads upon the forests.

8. The ownership of timber felled is usually conceded to the person felling the same, but if not used in a reasonable time it is sometimes used by others. I speak of timber felled but not cut up.

9. They might be, but they would have to appoint agents to look out for them, and as the persons usually appointed to positions of this kind are generally scoundrels, I doubt the wisdom of the policy.

#### LODE CLAIMS.

1. I have been in mining countries for nineteen years—about three years in Colorado and sixteen in Montana; have mined mostly in placer, but for the past four years have combined quartz and placer; have had but little experience in mine-surveying, and no personal experience in litigation.

2. Under the present law one person can locate a continuous vein of one mile in length, or five miles if it can be traced so far, by simply giving it a new name every 1,500 feet. This is wrong. No person should be allowed to hold more than two claims on the same vein, and the end-lines of the two claims should not be less than 2,000 feet apart. Then again a person locates a claim and does not represent it before the end of the year; locates it under a new name at the end of the year, and thus holds it for four or five years without doing \$100 worth of work on it during the whole time. That is wrong. No person should be permitted to relocate the same ground or any part of it, except he has represented the same, and does it to alter the lines formerly established. Then, again, they are too large. One thousand feet in length by 400 in width is large enough, and should include all veins within the surface, with the right to follow them to the depths of the earth, and the first location to hold when two or more veins come together.

3. If this question has any reference to cross lodes, it should not be done. There should be no cross lode after it comes to the surface ground of a prior location—that is, it should belong to the claim first located.

4. I understand the apex of a lode to be where it comes through or to the surface of the rock in which it is incased, though it may be covered, and sometimes is, with twenty or thirty feet of loose earth. The dip of a vein is usually determined at fifteen or twenty feet below the apex, but sometimes it is as deep as a hundred, depending on the shape of the mountain.

5. They are not properly protected.

6. Where a lead has much dip they sometimes go outside of the side lines and sink a perpendicular shaft and strike the vein, and litigation ensues.

7. No; but two seams running parallel, if near together on the surface, usually come together at some depth.

8. No; but have heard of such cases.

9. I have never seen a true outcrop as wide as 100 feet, but they sometimes terminate abruptly and come in again at from 50 to 200 feet, at a square angle, and come together at great depths.

10. Yes.

12. Have never known a case of the kind, but such a thing is possible.

13. Yes.

14. It is not possible while scoundrels are left at large, but rights of prior location can be better defined and protected.

15. Yes, in several in Montana. Have been where there were as few as seven men and where there were one hundred. All are miners when a mining district is organized. First a president and secretary *pro tempore* are elected; next by-laws are adopted to govern the size of claims and manner of location and representation; then a permanent president is elected to call all meetings and preside at them; then a permanent recorder, who records all claims located, making a description of the same, and who makes a record of all transfers.

16. Usually by number each way from the discovery, and the record holds good as long as the locator complies with the local by-laws.

17. Only when it can be done without interference with another location.

18. No; but if such a case does happen possession is the only security.

19. In this Territory quartz locations are recorded with the county recorder; so they are secure. But as they are frequently forfeited and relocated year after year, I cannot see that much good could result from it; but if some means could be adopted so a patent could be secured for less money, it would be a good move and thankfully received by the miners.

20. No; in a Territory like Montana there are too many contested cases for the local land officers to attend to; but a special judge might be appointed in each Territory, who might be an officer in the land office when not employed in contested cases, with appeal to the United States Supreme Court or the Commissioner. Some of these contested cases are very long, and it would occupy several weeks in each year to dispense with all of them.

21. Make the claims not to exceed 1,000 feet in length; limit the number of claims to one locator within a certain distance of each other; give each locator all that comes to the surface of the bed-rock in the bounds of his claim, and allow him to follow the vein in its dip as far as fire and water will let him, and when two or more veins come together first locator to take all; \$500 worth of actual mining exploration before application for patent; wells, cellars, houses, and all movable machinery not to be called improvements only in excess of \$500; and I believe that some cheaper method of securing title after the improvements are made might be adopted; but the advertising should not be dispensed with.

22. Yes; five years.

#### PLACER CLAIMS.

1. If this question is to include lodes, about one-third; but if placer only, I will say that if you take a section of this territory 200 miles square, and make this place the center, that less than 1 acre in 200,000 will pay \$1 per day for working.

2. Yes; have made locations, mined, and made application for patent.

3. Possessory title in ten to twenty days costs \$3 for record. By patent from three months to five years; costs in fees to the different officers \$115, and \$15 for advertisement, and \$2.50 to \$5 per acre additional; and if a patent is to be obtained inside of four or five years, an attorney from \$25 to \$50, at Washington, who will probably get it through in one year. With contest they are sometimes delayed two years in the courts of the Territory and the cost goes into the thousands.

4. Never had a contest, and this question is answered under question 3.

5. Defective.

6. They are defective in everything. They are a source of perjury, fraud, and blackmail, and an injury to the best interests of the mining countries, and should be repealed. Claims are usually not worked after patented, but are held for speculation. They are often used to apply for patent for ground belonging to other parties, for the purpose of securing some outside ground and getting blackmail enough to pay for all of it out of parties who have a good title to a portion of the ground and would sooner pay the amount asked than bring suit. They are used to try to steal a little good ground from some other parties whose grounds they cannot buy. Under local laws from one to four hundred feet by two to four hundred feet in width is a claim, and if work is not carried on during the summer they are considered abandoned, except the owner is sick or there is no water to work them. Can purchase as many as he can represent, according to local customs, which vary from one to two days in each week for each claim owned. Evidence of title is bills of sale and the books of the local recorder, and no use is made of them, except for mining; and the character of litigation is a suit of ejectment and damages or an injunction.

Yes, the United States placer laws are defective, and I will suggest that if the United States must have a revenue from them that they be not sold as at present, but be recorded in the local land office in claims of not more than 1,000 feet in length, and the number of claims that one man can hold be limited to a certain number in a certain distance, and a fee of \$2.50 for each 200 feet square claimed shall be paid to the United States land office at the time of record, and record required in a reasonable time; and the claimant not to hold the ground any longer than he shall place or cause to be placed on each claim a certain amount of permanent mining improvements in each year. Under the present placer law wells, cellars, cabins, fences, &c., are used to prove up on ground, and I know of one application for patent in this district for 160 acres on which not one dollar's worth of mining improvements can be found; and this reminds me of a plan or method adopted by applicants: One is to borrow hydraulic pipe and hose and haul them on the ground, prove up on it, and take the improvements off; another is to buy old improvements from some person who never owned them and prove up on the work.

7. Yes; Alfred Dell, 160 acres; Noyes *et al.*, J. Harrington, Jones & Harrington, township 3 north, range 7 and 8 west, Montana.

8. It has been used to obtain patent on ground where a number of ledges were known to exist at the time of making application; in this district R. D. and J. A. Leggat and A. W. Foster, range 3 north, 7 west; Noyes & Upton, 3 north, 8 west, Montana.

9. No.

#### CLOSING REMARKS.

In giving the above answers to your questions I have aimed to give them on my convictions formed by a long residence in the mines, and if I have erred it is my judgment. If I have entered too much into details it is because I wished to be understood. I have been more explicit on the mines because more interested, and I have only made suggestions which I believe to be for the best interests of all; and if in this long communication I have given your honorable Commission one hint that will aid you in dealing with this question of the mining countries I am content, and, asking that Commission to remember that to have a mine or a dozen of them is no proof that a man is rich or ever will be, I subscribe myself,

Yours, most respectfully,

WESLEY P. EMERY.

*Testimony of Lawrence A. Fenner, miner, Virginia City, Mont.*

The questions to which the following answers are given will be found on sheet being page 1.

VIRGINIA CITY, MONT., November 24, 1879.

To the Honorable Public Land Commission, Washington, D. C.:

GENTLEMEN: In reply to your communication I will state that I have been engaged in placer mining in this Territory and Colorado since 1860, and have had practical ex-

perience in all branches of gravel mining; have mined in Alder Gulch, near Virginia City, since 1864. I think that more than one-half of the land in this vicinity is mineral in character containing placers, and gold, silver, and lead bearing lodes, and also a limited quantity of copper, cinnabar, and coal have been found.

I have become familiar with the mining laws of Congress by actual experience in obtaining patents for placer ground, both with and without contest.

In 1875 I made application for 60 acres of placer ground by legal subdivisions. There was no contest, and after publication the acreage was paid, and two years after I received my patent. The total cost per acre in this application was \$5.

In March, 1877, I made application for another legal subdivision of 10 acres, adjoining my first application, and subject to the same local laws and customs in regard to possessory title. This legal subdivision was made up of ground which I could not embrace in my application of 1875, and of a purchase made just before application, and claims that were supposed to be abandoned, for they had been represented in no visible manner for many years.

An adverse claim of 2.77 acres was set up by certain parties, who filed protest and plat of survey in the usual manner. After a delay of one year, the case came up for trial before the district court at Virginia City, and it was decided I was entitled to 1.47 acres, and the adverse party 1.30 acres of the original adverse claim as filed by the protestants. The judgment-roll defined by metes and bounds the part to which each party was entitled. I immediately sent a certified copy of the judgment roll and pay for 8.71 acres to the land office at Helena, and got my receiver's receipt in return. The adverse party did not then take any steps to complete their title, nor have they since, but refused to give me power to patent the whole legal subdivision after I had offered them any security they desired that I would reconvey their portion to them after my title was complete. They declared that the only use they had for this ground was to make me expense in obtaining a patent.

Now, after a year and a half has elapsed since my filing judgment-roll, information comes to me that a decision has been made by the Interior Department that I will be under the necessity of making survey and plat in the manner provided for ground not legal subdivisions, this ruling involving an additional expense of \$85 or \$100, making a total cost for obtaining title to 8.70 acres of over \$500. Of course the largest part of this sum went to pay expenses of contesting the adverse claim. Witnesses had to be brought a long distance to prove a chain of possessory title, according to the local district laws, running through a period of twelve years.

As regards my knowledge of the experience of others, I will state that I know of one instance in this vicinity where the applicant suffered from the imperfect working of the mining laws of Congress in the matter of adverse claims, and I know of other parties who suffered severe extortion in order to escape an adverse claim from those who held small claims which had not been worked for years, and which were utterly worthless alone.

In order to show the evils arising from allowing mining districts to regulate the manner of possession beyond a limited period after discovery, I will give a short history of the mining laws of Alder Gulch, and this is but the history of many other gulches which have come under my observation. Alder Gulch was discovered late in 1863 and was divided into several districts. The first local law allowed each person one claim by pre-emption and one by purchase, each claim consisting of 100 feet up and down and from side to side, and in the lower portion of the gulch, where it is very wide, the gulch was divided by the original creek channel so as to form two tiers of claims. The two first seasons after its discovery nearly all of the gulch that would pay by the primitive method of mining, which is the only way small claims can be operated, were worked out and many claims were abandoned. About this time the miners' laws were so amended as to allow each person to purchase and hold as many claims as he could represent by doing two days' work each week for each claim, and soon after the laws were again amended in this (Nevada) district so that it only required a residence of four months each year for a miner to represent any number of claims. In 1866 a new system of reworking these claims in large bodies by means of flumes, hydraulics, and hoisting works was inaugurated—this style requiring work to be begun at the lower line and continued up stream. Then it was that some of these worked-out claims fell into the hands of men who used them only to extort money from and harass the larger claim owners, the local laws making this an easy matter, for, without marking boundaries, it was only required to have record made by number by a district recorder, who was bound in no manner to the faithful performance of his duty. Such was the state of affairs when, in 1875, the large claim owners first applied for patents. Some who held a large body of ground found themselves cut into by a single hundred feet of ground, the owner of which threatened an adverse claim unless unreasonable privileges were granted or an extortionate price was paid him for his ground.

By a ruling of the Interior Department several claims not contiguous may be included in one application, provided \$500 worth of improvements were made by the applicant or his grantors on each separate piece of ground.

A company of miners near here in this gulch, having two separate bodies of ground, desired to include both in one application, but were barred from doing so because all the improvements, valued at many thousands of dollars, were on one piece of ground, while the other was made up of several original claims which, after having been worked by the primitive method in the early day and afterward being abandoned, were located again and finally passed into the hands of the present owners for a valuable consideration.

The chain of title from the men who first owned and worked these claims was broken, and the only remedy was either to forego a patent or do \$500 worth of "dead work."

Again, it might happen that one of these flume companies after having patented their ground might purchase contiguous ground of the character just described, in which case they would be barred from patent for the same reason.

I know of no instance where a title has been obtained under the placer law for non-mineral land, although I know of one instance where the attempt was made. Within my knowledge the placer law has not been used to obtain titles to lode claims. I do not know any valuable placer lands which are unworked because the outlets are controlled by claimants under other than mineral titles, although this is liable to become a matter of litigation between parties at the mouth of the gulch. From my experience and observation I draw the conclusion that the mining laws of Congress in regard to placers need amending in the following particulars:

1st. For two years after a placer is discovered miners should be allowed to make their own laws in regard to size of location, manner of representation, &c.; after that those matters should be regulated by Congress.

2d. After local laws are abolished, placers should be required to represent by labor, marking boundaries, &c., in some such manner as is prescribed for quartz lodes.

3d. Five hundred dollars' worth of improvements on any claim should entitle the possessor to a patent for separate claims in the same or different applications, provided they are situated in the same mining gulch or district, and provided, also, that the applicant shall show that he includes nothing but *bona-fide* mining ground.

4th. There should be a stated time when acreage should be paid, and the failure on the part of an adverse claimant to comply with this provision after his possessory title has been confirmed by a court of competent jurisdiction should leave the applicant free to continue his application the same as though there had been no adverse claim.

5th. Placers should be surveyed by the system of triangulation, and the manner of patenting by this system should be simplified as much as possible. In this gulch miners have patented both by old location and legal subdivisions. It was generally understood that the Interior Department favored the rectangular system the most. Then there is long delay and extra expense in obtaining order of survey, posting and filing plat, &c.; consequently some thought best to make application by legal subdivisions and suffer the inconvenience of leaving out corners of actual mining ground and taking in some of a worthless character. The two systems do not work well together, and either the one or the other should be abandoned.

6th. The manner of contesting adverse claims should be made more simple, so as to avoid all harassing delay and unnecessary expense.

In conclusion, I trust that it will be considered that I have not been overofficious in this matter, and that some information may be gleaned from this crude statement. It is possible that my experience in adverse claims is somewhat isolated, but such may occur again.

Respectfully,

LAWRENCE A. FENNER.

#### *Testimony of William Flannery, Bozeman, Gallatin County, Montana.*

The questions, to which the following answers are given will be found on sheet facing page 1.

1. William Flannery; post-office address, Bozeman, Gallatin County, Montana; farmer, stock-raiser, and owner of a saw-mill.

2. Thirteen years.

3. Yes, by pre-emption, homestead, and timber-culture act.

4. From reading, inquiry, and observations.

5. The expense of filing a pre-emption was from \$3 to \$8, and homestead from \$16 to \$24.

6. I do not remember the amount required when final proof is given. I do not know the expense of contested cases. The average distance to a land office in this Territory is about 100 miles. The time it would take to make a trip and do business would be six days, traveling expense of a man and horse would be \$4 a day. This would be the expense when a party would furnish their own horses. Other modes of conveyance are more expensive.

6. The register and receiver ought to have a fixed fee for getting up all the papers necessary for getting a title to public lands, and oblige them to fill blanks without charging an attorney's fee. Public land in the Territories ought to be pre-empted in all cases at \$1.25 per acre. Railroad lands ought to be settled and acquired at a fixed cost with the other lands. It retards settlement too much to have one-half the land withdrawn for railroad purposes and one-ninth of the other half for school purposes.

7. Consists of mountains, foot-hills, and valleys, limestone formation predominating on the surface. Valleys along water courses usually excellent agricultural land. There is some swamp-land which has an imperfect drainage; it usually has an excess of alkali. Foot-hills are agricultural, pastoral, and sometimes mineral; mountains are mineral and timber.

8. The classes of land are so mixed up in this Territory it cannot be classed without a careful examination of each tract by competent men. The only general rule that could be adopted in Montana is to class all mountains as mineral and timber, foot-hills and valleys as agricultural and pastoral; then there would be some agricultural and considerable grazing land in the mountains, and some mineral lands in the foot-hills and valleys.

9. The present system in theory is satisfactory to the public. It might be modified so as to meander where there are natural divisions as between hill, mountain, and valley. It would be quite an inconvenience to the public to get educated on a new system of survey when the present one gives satisfaction. Timber in the mountains would have to be surveyed meandering with cañons and ridges. Mineral surveys would have to meander with the minerals claimed.

10. The present system seems to me to be all that could be desired, except the desert act, which does not accomplish what it was created for. There is considerable land taken up under this act that can be watered as easy as the average of the land taken up under the homestead law in this Territory. During the settlement of the Indian question large tracts of country are made habitable to white men by Indians being compelled to go on their reservations and quit their roaming habits. This land is first occupied by cattle and sheep, whose owners command considerable capital. They do and can take up large tracts of the most valuable agricultural land and put water on at a nominal price, and when they get a title to it will hold it for speculative purposes. There ought to be inducements given to capital to sink artesian wells and bring irrigating canals on land that is very difficult to bring water on. Such an act should reserve all land that has a supply of water easy to control. I would suggest that a desert claim of 640 acres should have an irrigating canal that would cost \$1,000 to \$1,500, or an artesian well sufficient, allowing a section of 640 acres to make four farms of 160 acres each. Three or four hundred dollars for an irrigating ditch is not too great an expense for a homestead or pre-emption in this Territory. Very frequently \$1,000 or more has been expended on getting water on homestead land. A desert act should be free only to land that individual enterprise, under the homestead and pre-emption laws, would not settle.

#### AGRICULTURE.

1. Rainfall, light; snowfall, in winter considerable; supply of water for irrigation everywhere sufficient at some cost; climate, cold but seldom severe.

2. Grain crops are sowed in April and May, and harvested in August and September. April, May, and sometimes June, have sufficient rain. When it rains on the valleys, it snows on the mountains, the more rain the colder. Crops do not grow fast until the dry season, excepting of course the natural grasses, the source of water being in the mountains, snow on which does not thaw until warm weather.

3. Very little.

4. Nearly all the arable land.

5. Wheat, oats, barley, and like cereals, Irish potatoes and all the hardy vegetables.

6. Wheat in this county is scarcely ever irrigated but once. The amount of water required is controlled by local influences on character of soil, the amount of fall, evenness of surface, &c. There could be no general standard quantity for each acre that would be satisfactory.

7. Almost every stream large and small can be used at some expense for irrigating.

8. Irrigating in a dry climate means a sure crop from this cause. I would not give a good irrigating system for any climate I know, for agricultural purposes. Irrigating does and must improve the fertility of the soil, for it leaves everything it holds in solution, which is considerable in the higher stages of water. Crops can be raised on an altitude of 5,000 feet or perhaps greater.

9. During the irrigation of crops all the water turned into the ditches is supposed to be used. After irrigating some leave water in their ditches through carelessness and for uses other than irrigating. The law of the Territory gives a prior right to water to irrigate 160 acres, and does not allow waste to the detriment of others.

10. The Territorial laws require ditches to be recorded in the county clerk's office. Most of the ditches are held without any record, by continued possession. There may be trouble to find who has a prior right after this generation passes away.

11. There is some difficulty between parties on small streams; but no legal conflicts.

12. One-half.

13. It is not. Considerable good agricultural land would be taken up and monopolized under such an act. Let the herds of stock occupy the land first free, and then let homestead settlers occupy the land and take the place of the large herds of stock.

14. No. I would give the range now to stockmen free, allowing all to occupy it under the homestead and pre-emption acts, and then in time it will be occupied by permanent settlers. It is impossible now to establish the agricultural limit of this land. There is in some of the "bad lands" as fine wheat land as there is anywhere.

15. Without having any accurate knowledge, I would say 3 acres. This county is as good grazing as any in the Territory.

16. Increased; got thicker.

19. But few. Would depend on locality and with regard to water and shelter.

20. If herds were confined to specific ranges it would increase the cost of herding, but would allow cattle raisers to improve their herds without being interfered with by their neighbors' inferior stock.

21. Numerous mountain streams and springs.

22. Five.

23. Increased.

24. Yes.

25. Some jealousies, mutterings. No conflicts.

26. There are 8,760 horses, 46,704 cattle, and 26,110 sheep in this county. Horses and cattle are let run at large and looked after. Sheep are herded in herds from 500 to 2,000.

27. Yes. Mounds are not large enough, and where rock is used hard to identify and find.

#### TIMBER.

1. Two-fifths of the mountains are covered with pine, different varieties. There are cottonwoods along the streams and scrubby cedars on the dry foot-hills in places. There is but little in this section fit for lumber.

2. Planting timber has been practiced only a few years. Cottonwoods are principally planted. There has not been enough of experience in the business to form deductions from.

3. In disposing of timber land in the mountains a right to discover and work the precious metals should always be reserved. Farmers and stock men the owners of 160 acres of land or less amount in proportion ought to have a homestead of 80 acres of timber, providing that they make proof before they get final title that they have lived on their farm for which they want the timber land five years, and settlers taking up a homestead ought also be allowed to take 80 acres of timber. The advantages of giving farmers a tract of timber are numerous, among which are that it will cause farmers to acquire a habit of owning timber among them, which will often cause farmers to plant tracts of timber when it cannot be otherwise procured. Their use of timber is constant, and the amount of timber required by a farm can be estimated, which cannot be done in any other business, &c.

I would sell tracts of timber not exceeding 160 acres to owners of saw-mills, mines, manufacturers, or owners of any business that requires the use of timber, allowing them to locate a tract sufficient for their business for two years, not exceeding 160 acres at \$1.25 per acre, providing that the land and timber not used shall revert to the government five years after it was purchased, allowing a party to buy a new tract when they pleased, but providing that any former purchase for the same business shall revert to the government, &c.

Timber in the mountains frequently in inaccessible cañons, in which it is difficult to make roads, and the enterprise that will make those roads ought to be protected by obliging others that may use them and be benefited by them to pay a reasonable proportion of their cost, as in the case of joint fences or other mutual benefits. Under existing Congressional law the Territory cannot accomplish anything like this. Popular opinion thinks that the government ought to give the timber in the mountains free, which may be the best way. In any case, those that make expensive roads to inaccessible places ought to be protected in their enterprise. As the matter stands now they are left to the generosity of the American people, the majority of which respect men's rights in such cases.

4. It may be advisable to distinguish between forests that are sufficient for export and that which is only capable of common domestic uses, of which there are large tracts of country that contain only the latter, and some which contain the former.

5. There is a second growth of the same kind of timber rather slow to start, but when started grows fast.

6. Forest fires were apparently very frequent before settled by white people, and is now where Indians roam. Since, and where settled by white people, there has been but few fires. There was vast quantities of timber burned apparently before this country was settled, but now has grown up in young pines. Tracts of prairie are never burned here. The grass is needed dry or green. The laws of the Territory make the careless use of fire on prairie or timber a criminal offense.

7. In this Territory there is no source or supply of timber except in the mountains, which is not agricultural, and is mineral land; therefore all the timber used is of government land. I cannot say that there is much unnecessary waste. It would be necessary to enact laws against waste of timber; it would be necessary to give the public a reasonable time to change from the old to any new system that may be established.

8. It has been decided in the courts that when timber was felled and moved it was then the property of the party who felled and moved it.

9. Their position would suggest that they ought to be the custodians of the public timber.

I do not want to make any suggestions on mineral land. The inclosed are the views of the masses of the American public, which have the welfare of the masses and the best interests of the government in view according to my knowledge and belief.

Very respectfully,

WM. F. CANNERY.

---

*Testimony of George B. Foote, mineral deputy surveyor at Helena, Mont.*

GEORGE B. FOOTE, mineral deputy surveyor at Helena, Mont., testified September 21, 1879, as follows:

I have lived in Montana since 1864.

Question. What do you understand the apex of a lode to be?—Answer. The apex of a lode is the highest point where it reaches the surface. It is not always possible in the early workings of a claim to determine the apex of a vein or lode.

Q. Has there been much litigation here?—A. There has been considerable litigation in regard to the jumping of placer claims; more in regard to placer claims than lode claims. In lode claims there has been some litigation growing out of a variety of locations conflicting. Lodes interfere one with another. The parties are often unable to tell which is the real owner. I have known two parallel seams, otherwise on the same outcrop, being located by two parties; and this gives rise to contest.

Q. Are or are not the outcrops of lodes often wider than the local width of claims here as defined by United States, State, Territorial, or local district regulations?—A. There are not in the Territory of Montana any such lodes. Under the old law of the Territory claims used to be 100 feet on each side of the vein; but the Secretary of the Interior decided that 100 feet on each side of the vein meant from the center of the vein. I carried the case up to the supreme court of this Territory in 1874-'75, and the supreme court of Montana decided that it meant each side of the vein itself and not each side of the center; and on that decision I got a patent for quite a number of mines. That law is now repealed and the United States law is accepted.

Q. Are or are not a large majority of the discoverers of rich veins, or their assigns often burdened with costly litigation to defend their rights from subsequent locators in their immediate neighborhood? And in such cases is or is not the legal attack most often directed to the portion of the dip of the lode which has passed beyond the exterior lines of the surface tract?—A. Yes, I know such cases.

Q. In view of the known variety and complexity of mineral deposits in rock in place is it or is it not, in your judgment, possible to retain in the United States mineral laws a provision by which locators can follow the dip of their claims outside their side lines without provoking litigation?—A. Yes, by making a square location. I believe in the square location of all mines. I think it would be to the interest of the miners and every one else to make a square location of so much ground and confine them to that ground.

Q. Have you ever taken part in organizing a local mining district?—A. I have taken part in the organization of mining districts, but that is abolished now in the Territory of Montana.

Q. State generally the mode of originally taking up and locating a mineral claim under mining customs and the effect of a record of such location.—A. Now a man locates a claim and files an affidavit in the county recorder's office.

Q. Is that record capable of subsequent amendment; and if so, how?—A. A person can alter a location before it goes up to the surveyor-general. There can be a great amount of fraud committed.

Q. Within your knowledge have mining titles been distributed or litigated through fraudulent manipulation or destruction of these records? If so, what security is there against such frauds?—A. Yes, sir. In the decision of the supreme court in the case of *Carpenter vs. Rankin*, a case over in Washington County, in this Territory, which went to the United States Supreme Court on appeal, the Judges of the United States Supreme Court gave the judges of the supreme court of Montana a blowing up, because they would not admit the testimony of competent persons after the records had been destroyed.

Q. Calling your attention to the fact that a copy of the certificate of location as certified by the local mining recorder is the sole basis of the paper title for a mining claim under existing law, and that compliance with the varying customs of innumerable mining districts constitutes the preliminary acts upon such claims, state whether in your opinion all mining district laws, customs, and records could advantageously be abolished as to future locations and the initiation of record title be placed exclusively with the United States land officers.—A. I think it would be much better, and I think it ought to be done.

Q. Calling your attention to the fact that under present laws an adverse claim, in proper form and seasonably filed, suspends the administration of the mineral laws by the United States land officers and transfers the jurisdiction to the courts of law, both State and United States, please state whether in your opinion the adjustment of controversies concerning mineral lands prior to issue of patent should not be left absolutely to the United States land officers in the same manner as contests are under all other land laws?—A. I think not. I think there should be a method of getting a case into our Territorial courts to be tried by juries of miners.

Q. If you consider it desirable to retain the leading features of the United States mining laws, what amendments, if any, would you suggest to remedy any defects which your experience or observation has detected? If, on the contrary, you believe that the practice of following the dip beyond the side line of a claim is incompatible with satisfactory administration, what method of location would you suggest?—A. In the first place, the United States law should be so amended that if mill-sites are allowed to be located, I would make it at least 40 acres to the location. I would have men and locations confined to the square location. I would also have a number of things in the land office simplified.

Another thing. It is an outrage on all miners, and it is an outrage on every claimant, that a man that goes there to Washington and puts out a little cash can get his patent through very soon. I would have the Land Office adopt the same system as the Patent Office. I would not have any preferred claims. Unless a man gets an attorney in Washington it takes from one to four years to get a patent in its usual course, and sometimes it takes five years. Another thing which is bad is the fact that, although the land is paid for and the patent certificate sent up to Washington, instead of that patent being sent here to the district land office that they may record it on their books, the patents are delivered to persons in Washington and no notice of their delivery sent to the district land office. The district land office frequently gets notice of the delivery of patents from Copp's Land Owner and from the parties themselves.

Q. From your personal experience, please state the time and expense of procuring a mineral title; whether possessory or by patent, both with and without contest.—A. All claimants within two years from date of their application should be compelled to pay up. It might be ten years with a contest, or perhaps it might be a thousand years without contest. For an ordinary lode claim the cost is: for the surveyor-general's fees, \$25 to \$40; land office fee, \$10; surveyor's fee, from \$30 to \$50; making papers and notary's fees, \$25; publication, \$25; recorder's fees, from \$5 to \$10. I think the law ought to be amended so as to allow attorneys in fact to make applications, and make out all necessary papers filed in adverse claims.

I am familiar with the rectangular system, and I think it is the best system that can be adopted. I think it might be well to use triangulation in order to overcome natural obstacles like hills, mountains, &c. The monuments in these surveys are very poorly established. There is great complaint among the settlers on that account. I am very frequently employed by persons to make resurveys. It usually costs a settler considerable money. In three years the monuments disappear so that the corners cannot be found. I think it is due to the contract system. I would remedy it by paying more money for the surveys and having an inspector. Then there should by all means at convenient distances be fixed monuments established. Most deputy surveyors use the solar transit on the mining lands. In sub-dividing many of them use the needle. I think it would be well if the deputy surveyors should carry an aneroid barometer. There is much bad surveying done. In township 8 north, of range 3 west of the principal meridian of Montana Territory a creek is laid down as running in sections 20 and 32, but it runs three-fourths of a mile west of where it is laid down. I have frequently found quarter sections that would not tally out. Range No. 9. west of the principal meridian will show some very bad surveying, and on the ground I can show worse surveying than that, although it looks pretty well on paper. You cannot go

to the county recorder's office where the records are kept and find one in fifty mines from the description given there. I can show you claims here that are not within six hundred feet of where the plat puts them. Take the Nellie Grant mine in Jefferson County, Montana, there was no survey made of this mine before they got a patent for it. I would remedy this sort of thing by employing better men, giving them more money, and using better instruments; and before they get their pay, let their work be inspected. I think there should be closer surveys made.

I think the timber ought to be surveyed and sold. For instance, a man who is a mine owner or mill owner or owns a range should be allowed to come in and pay for a certain lot of timber land. I would sell it for \$1.50 per acre. I would sell the timber, reserving the mineral on the land. If a man bought a mine with timber on it I would give him the timber. Under a proper system of irrigation one-sixteenth of this Territory can be irrigated. I think that the pastoral homestead idea is a very good one, but I am afraid that a great deal of fraud would be committed under it. A man with large herds I would allow to lease or keep the land until they were able to buy it. I do not think the government ought to charge more than fifty cents an acre for it.

I have had experience in surveying ditches and the usage is, and I think the law also, that when parties take up water and use it or put it to use they have the exclusive right to that water. They take it all and do what they please with it. They are not compelled to return it to the stream, although I believe there was a law passed at the last session of the legislature where if water is not used it shall be returned to the stream. This relates to the use of water for irrigating purposes, but it ought also to apply to mining.

I think that the desert-land act is a very poor act. They are taking up irrigable lands under it and sometimes take up marshes and swamps. There is one suggestion I would make in regard to this desert land. For instance we have thousands of acres here that could be irrigated and made good land by bringing a canal from Jefferson River around the different bench lands here and cover these low valleys; but it is an enterprise which will cost thousands and thousands of dollars, and can only be done by aggregation of capital or by some company. I think the government should give every alternate section for irrigating purposes; that is, the government should assist irrigation by this means.

I think the placer-claim law ought to be so amended as to compel "representation" by parties making placer claims, the same as lode claims.

---

*Testimony of Daniel Flowerree, stock and cattle raising, Helena, Mont.*

DANIEL FLOWERREE testified at Helena, Mont., September 27, 1879, as follows:

Am engaged in the stock and cattle raising business. My range is in the Sun River and sweet grass country, about 80 miles from here on the Yellowstone. I have in the neighborhood of 11,000 head of stock. It takes about 30 acres to support a head of beef.

I have no title to any of this land, except a homestead and pre-emption in the Sun River country.

Our cattle range in herds of about 8,000 head. Each herd ranges over about 25 miles square. This range is about 25 miles square, and I think about 8,000 head of cattle pasture thereon. I cannot state the size of the other range, because I have just driven our stock on to it. Our oldest stock ranges are well stocked, but this is not the case where they are newly settled.

In my experience, a range decreases year by year by feeding; it takes more grass each year. I think ownership would be beneficial to the stock, to the country, and to the settlers. There has not been any conflict between sheep and cattle men, but there is likely to be trouble after awhile. Cattle and horses will not graze where sheep have been. The sheep graze the ground very closely, and a very long pasturage of sheep kills the bunch-grass. I have noticed in Oregon, where sheep have fed they have cleaned up the grass, and dog fennel has grown in place of it. I saw this more plainly in Oregon than I have here, because our ranges are all new here.

I think something ought to be done with the pasture lands, but I do not know just what. I think it would be well to allow a man to own land to the extent of his herd. I think the pasture homestead theory is a good one. This land is worth from 20 to 25 cents per acre, but I should limit a man to the amount of stock he owned. In the course of time we will certainly have trouble here—the sheep and cattle and horse interests will conflict. In nine cases out of ten sheep men will come in on the cattle men and drive them out, and eventually the cattle men will have to leave.

The cattle interest is largely on the increase here. It is becoming a most important

interest. There is more real money invested in stock than in mines. I know of one man over on the Sun River, Mr. Concourse, whose cattle could be sold to-day for \$160,000 in cash. The next herd to his is that of A. A. Clarke, and his herd is worth nearly as much. There is another herd there which is worth \$140,000, and the herd that Bob Ford owns is worth from \$75,000 to \$80,000, as also the herd of the man next to him. The herd of John Mining is worth not less than \$40,000, and there are many more of them. You could go through Sun River; you could gather up right on Sun River more than would buy the whole Penobscot country. My herd is worth \$160,000. In the future, the pasturage interest is to be a great source of wealth. It is worth all the mining of the country.

The bunch-grass interest has not been represented; only about nine years since men went into the stock business. We have here bunch-grass, blue joint, and the Buffalo grass. The bunch-grass, although it carries a larger number of seeds, if the cattle eat the seeds off and they do not fall on the ground, the grass comes again from the roots; the blue joint also grows from the roots principally. The other grasses I do not know much about.

We have considerable white sage. We do not have much other sage bush. There is less where I live than in the other parts of the Territory. I put up no hay for my stock. The only land I own is 580 acres, a desert-land claim, and 380 acres which I took up under the homestead and pre-emption law. If I had an opportunity I would get a title to that range and make my cattle business a permanent thing.

I know of no better way of disposing of the public land than through the register and receiver. I think that the men who are occupying the land should have the first chance to buy it; that the cattle settlers should be preferred.

---

*Testimony of James Gibson, stock raiser, Old Agency, Mont.*

The questions to which the following answers are given will be found on sheet facing page 1:

OLD AGENCY, MONT., October 5, 1879.

*To the members of the Land Commission, Washington, D. C.:*

GENTLEMEN: Your circular received.

1. My name is James Gibson; my residence, Old Agency, Choteau County; and my occupation that of a stock raiser.

2. I have lived in this county seven years and in the Territory fourteen years.

3. I have not yet acquired a title to any government land, but am now perfecting two—one under the homestead and one under the desert-land laws.

4. My opportunities for gaining any practical knowledge of the working of the land laws is limited, this section being comparatively new to settlement, no one within twenty-eight miles of me having yet acquired a title to any land from the government.

7. The physical character of the land of this section is level, bench, and valley, the benches being remarkably level, and the valleys—the Marias, Teton, and Sun River, with their several tributaries—are fertile, though the soil is rather shallow and of a sandy character. The surrounding country is entirely free from mineral, and timber only existing on the mountain sides, distant 20 miles. There are known to exist within 25 miles four or five coal veins.

10. In my opinion no one individual should be allowed to acquire from the government more than 320 acres of the public lands, and they should be taken under the homestead and pre-emption laws as now existing, except that the party taking the land should be allowed to pre-empt as well after homesteading as before. The timber-culture law is good, except that it gives the individual too much land. The desert-land law in my opinion is the worst of all existing land laws. It has no friends among the classes who build up a country, and they are loud in denouncing it a fraud. Even among those who have benefited by the law will be found numbers who consider it an unwise law, but took the land up, like I did, to get the start of others whom the law would have permitted to have done so. If the government see fit to dispose of the lands of Montana to the moneyed classes, she should at least wait a few years before doing so, in order to give the emigrants who are just commencing to fill our Territory an opportunity to locate upon some of the eligible sites, and there are many.

AGRICULTURE.

1. The climate of Montana is remarkable; it appears to be changing. Previous to four years ago, or five at the outside, rain was an unfrequent occurrence. Eight years

ago it was a remarkable occurrence. Twelve years ago a rain was a phenomenon; it would astonish the beholder as much as three inches of snow in Washington City on the 4th of July. Within the last two years the rainfall has been nearly, not quite, sufficient for irrigation. This year the rainfall has been better adapted to irrigation than last. To-day, the 6th October, it is raining, and was raining all last night. It is a steady rain, such as they have in Pennsylvania. A rain at this time of the year I don't recollect of ever having seen in Montana on the eastern side of the mountains before.

2. What may be termed our rain season is the latter part of May and June.

3. There is no portion of this section that has been successfully cultivated without irrigation, though it was tried last year about our rainiest season.

4. Three-fourths of this country could be cultivated with irrigation.

5. Our principal crops are wheat, oats, and potatoes.

6. I am unable to state the quantity of water required to irrigate 100 acres of wheat, having never given the subject my attention.

7. The supply of water is considerable, though small when the great extent of country is considered. Some of the finest wheat lands in the country will never be fit for anything but grazing purposes unless our rainy seasons continue, and I think it very probable that they will. The water supply for present irrigating purposes is ample, and consequently there has been no cause for any trouble about water among ranchmen.

13. In my judgment, if a person desires to locate his homestead on pasturage lands he should be permitted to do so the same as if he had located elsewhere. I do not consider it advisable for the government to put the so-called pasture lands in the market for private entry. They should be held back at least a few years for actual settlers. If the government were to put these lands in the market for private entry, they would be bought up by moneyed men who would have capital to invest, and who would most probably not own a hoof of cattle in the world. They would not locate their lands back on the arid plains for the purpose of securing a range for their herds, but would locate their purchase on the low benches along the streams or back on the higher benches, where with a little expense a river could be turned, thereby redeeming some of the best agricultural land in Montana. I could locate four townships and with very little expense turn the Teton River on it, and thereby make a fortune, provided I could borrow the money until I made the turn. The best lands of Montana are yet to be taken up. I would advise the government to wait a few years.

15. The cattle of this section occupy a common range, as elsewhere. It is difficult to state what amount of pasturage one animal requires to fit it for market. The grass is visibly diminishing on this range.

17. There are between 12 and 15 head of cattle to a square mile on this range.

19. Cattle men do not fence their ranges in this country, and it would not be safe to fence cattle in on a range in winter unless it was quite extensive.

21. Previous to four or five years ago the source of water supply for stock was the rivers and small streams, but since then numerous lakes have been formed by the rains on the benches, and contain water the year round. Besides these lakes, the country used to be cut up with dry ravines; now all the deep ravines have flowing springs, and there are indications that the shallow ravines formerly contained running water.

23. There are but few sheep on this range at the present time.

24. There is no doubt but what sheep will hurt the pasturage for cattle and will eventually drive them off.

25. There has been no conflict between the sheep and cattle men of this section.

26. I should judge that there was about 30,000 head of cattle and about 8,000 head of sheep in this county. Cattle are not herded, but are at liberty to roam wherever their inclination may lead them, so long as they do not cross the borders of a certain specified common range. Sheep are all herded; 3,000 head is considered the maximum number to be herded together.

28. It is somewhat difficult to find the corners of surveyed lands.

#### TIMBER.

1. There is no timber land in this section except the forests of the mountains. The timber is pine, spruce, and fir.

2. There is no timber planted in this section except cottonwood.

3. I think it is somewhat soon to dispose of the forest-timber lands.

5. When forest timber is felled there is a second growth, although there is but very little timber felled.

6. Forest fires of this section are caused by Indians who are allowed to leave their reservations. The fires are very destructive, and the only mode of prevention is to keep the Indians on their reservation and offer a reward for the apprehension of any one who shall maliciously or carelessly set out a fire.

7. The only use that timber is put to in this section is for building and fencing purposes and for fuel. The mountains are covered with dry fallen timber, much better for buildings and fuel than the green standing timber, consequently there is no waste, as the fallen timber will lie there and rot if it is not used.

8. Timber, when cut into logs or rails, belongs to the chopper.

9. I think that the custody of the timber should be placed within the jurisdiction of the district land office. Mining I know but very little about.

I have the honor to remain, respectfully,

JAMES GIBSON.

*Testimony of W. C. Gillette, sheep raiser, Dearborn, Mont.*

W. C. GILLETTE, of Dearborn, Mont., testified at Helena, September 26, as follows :

I have lived here nineteen years. I am engaged in the sheep business. I have about 6,000 sheep. I think about eight sheep are equivalent to one beef. I think about 25 acres of land will sustain that number of sheep. I own 160 acres as a homestead, and there is unlimited range around that. My range does not interfere with other people. It is 4 miles one way and 12 or 15 the other. This range is on surveyed land. I hold it by common consent. The Territory is not one-fourth stocked yet, and there is no trouble as yet between the cattle and sheep men. I think that sheep and cattle can live on the same range, provided it is not too heavily stocked. I do not think this land should be sold. I think they should be let run.

I do not favor the pasturage homestead. I would like it myself, but I don't believe it would be good for the majority of people. Under proper restrictions, it might be well to give a pasturage homestead of 3,000 acres, but I would provide that the settler should not have more than 160 acres on a stream, and, where he located, that it should extend back into the arid lands. He should not monopolize the whole water supply.

I do not think that our range decreases under our system of feeding. Our system is to feed on the range until the grass becomes a little short and then move off. This gives the grass an opportunity to recover. Through the winter we keep the sheep only three months on the home range—we only keep them about fourteen weeks at any one point. If the government does not make a pasturage homestead I think it will be better to leave this land just as it is. The agricultural land and the irrigable land should be taken up under the homestead and pre-emption act as it is at present. I do not think there is any hurry about settling the question here. I would be willing to allow the stockmen to purchase the land to supply their herds, provided that it was positively arid land; but I think it would be very hard to discriminate. I would not advocate the sale of these lands in large tracts, I would rather leave it as it is. I do not strictly consider this an agricultural country. I would like very much to take up land under the desert-land act, but I cannot make sure that it is desert land.

The largest number of sheep owned here by any one man is about 16,000 or 17,000. They herd in bands of about 3,000. I think there are about 150,000 sheep in the Territory and about 300,000 cattle. Sheep average about \$2.25 per head, mixed breed, cots-wool and merino. We have scab here but no hoof rot—the alkali cures the latter. We treat the scab with sulphur, lime, tobacco, corrosive sublimate, carbolic acid, &c.

I know very little about the timber. I do not think it should be sold. I think it should be reserved for actual settlers. We have some coal here within 12 miles of Helena. Near my range on the Dearborn there is some that is of fair quality. I think there is enough to supply this region. There is some coal on the Dearborn near Eagle Rock. There are surface croppings. I once came upon some which I supposed to be an old camp fire, but found it to be coal.

In regard to mines, I think it would be much better if the law should remain as it is, but I think parties should be compelled to pay up. There is no land here that can be cultivated without irrigation, except in a very few cases, which are phenomenal. I think about one inch of flowing water to the acre is sufficient to raise a crop.

No cattle or sheep men are fencing their ranges here.

*Testimony of R. D. Harrison, assay office, Helena, Mont.*

R. D. HARRISON, in charge of the assay office at Helena, Mont., testified, September 27, 1879, as follows :

Grave questions, involving large interests, sometimes arise here in mineral matters. For instance, A discovers a mineral vein, locates his claim under the law, but does not take up a patent; stakes off his claim 600 by 1,500 feet, but does not do any more work for a while; yet he is within the law. B, in working near him, discovers that

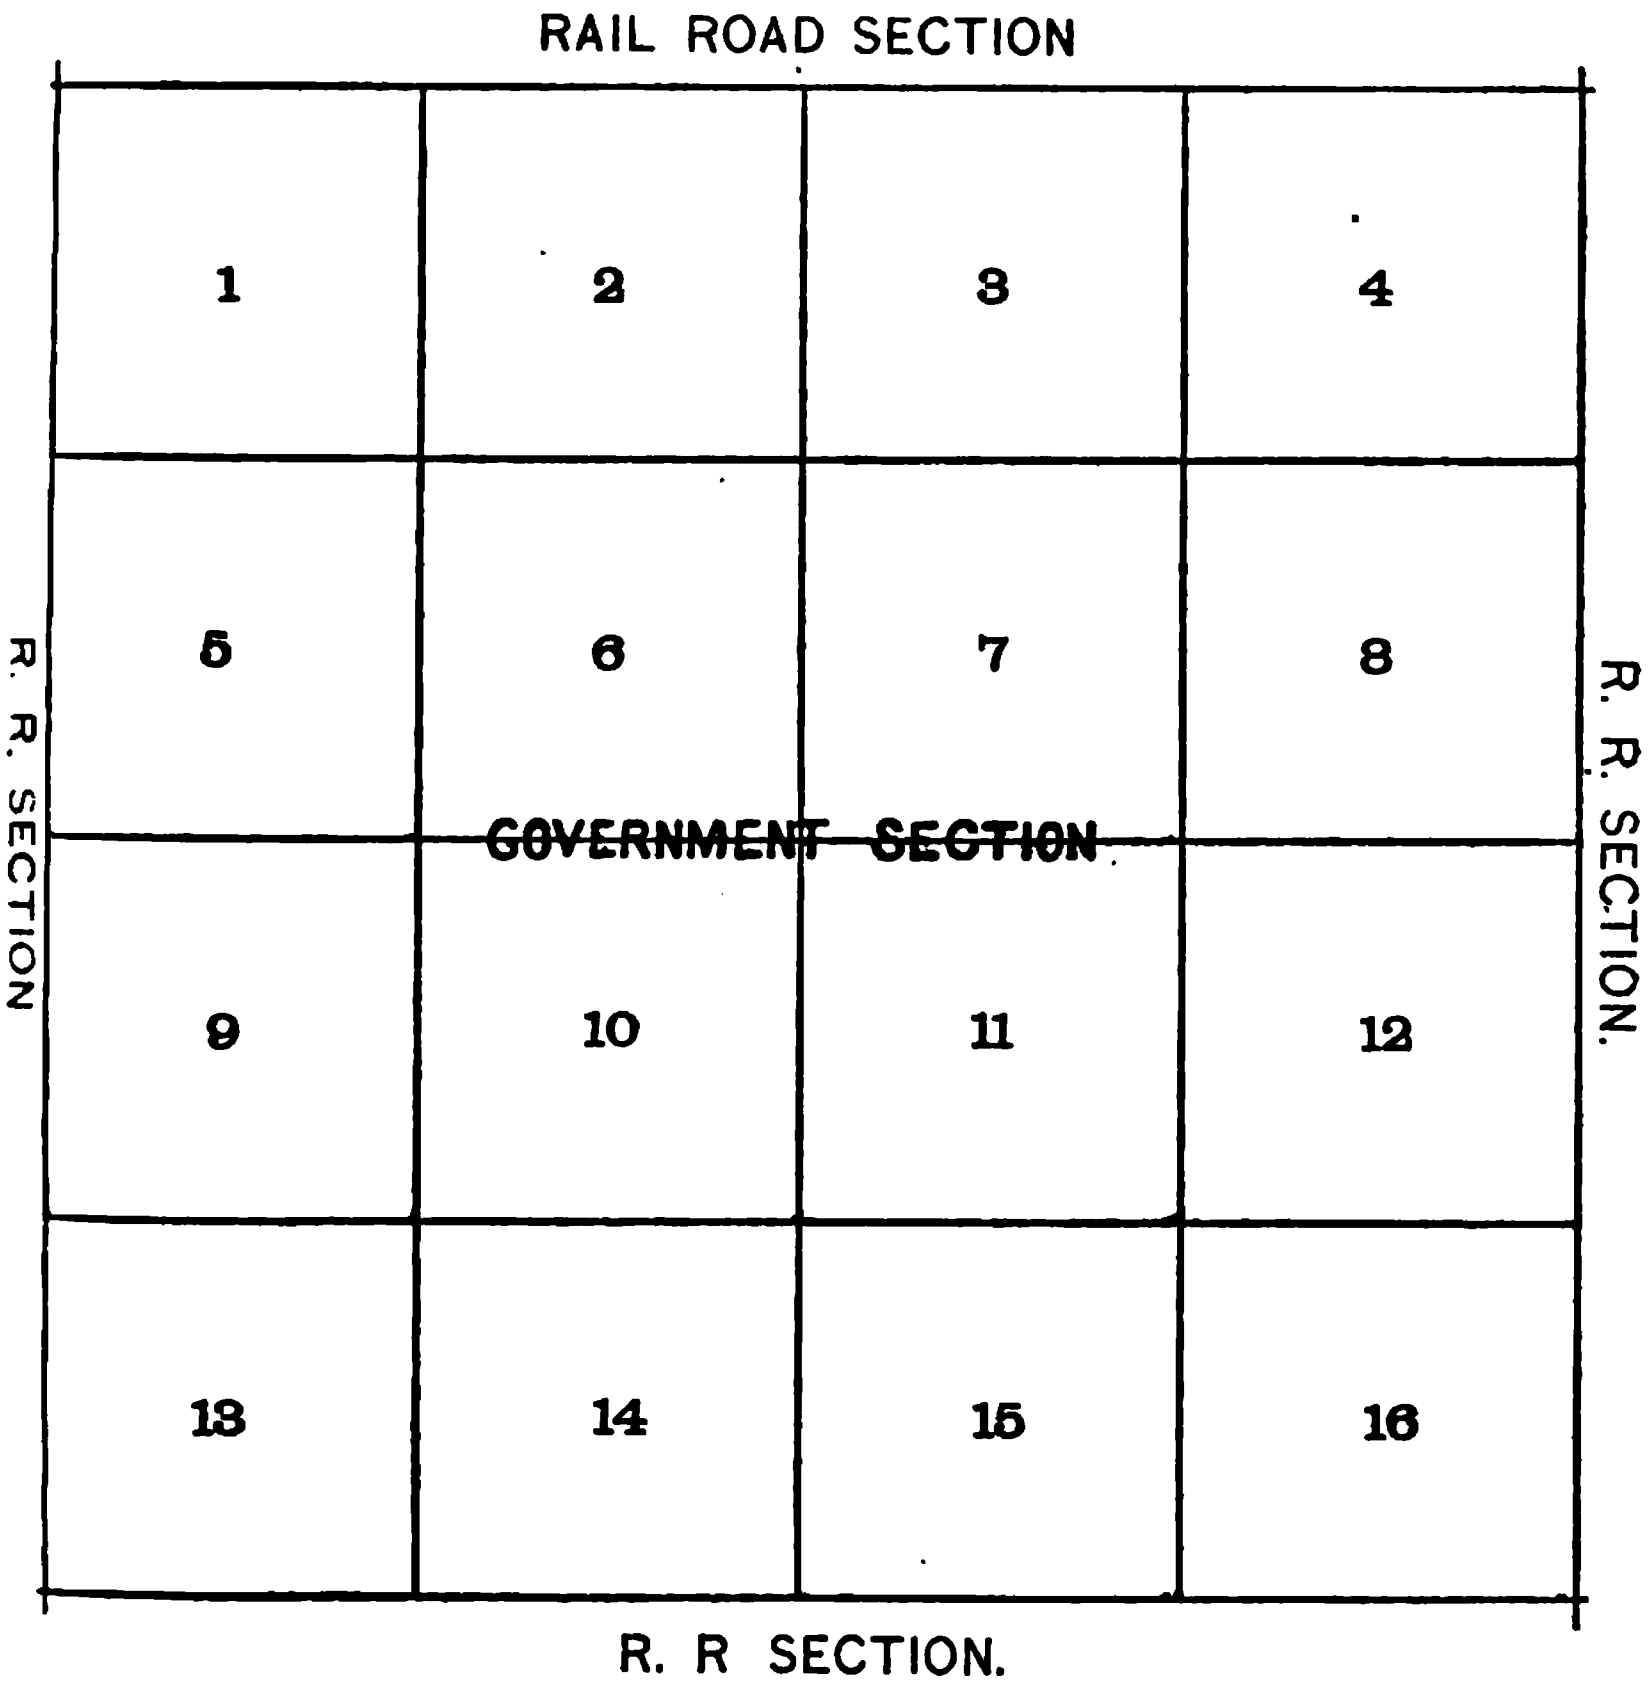

A is not on the vein—that is, he is not following the direction of the lode—and he discovers a cropping, say 300 feet, from A's shaft diagonally, and he thereupon puts down his shaft and locates a claim and stakes it at 1,500 feet by 600, running diagonally to the surface of the side lines of A's claim. Then the question is, who is entitled to the ground from A's side lines to B's discovery shaft, for the reason that A is entitled under the law to his discovery vein, and to 1,500 feet following the vein, and to 600 feet across the vein.

Cannot A now swing his claim around so as to take in part of B's claim and hold it under the law? There is a practical case in this country that I know of. I believe it has been tested in some State or Territory, and it has been carried to the Supreme Court of the United States; but I do not know how it has been decided.

The diagram I now hand you will explain the situation and show the application.

I also hand you another diagram which explains itself. It is in relation to the relative location of railroad and government sections of land.

Sections 5, 6, 7, 8, and 9, of 40 acres each, taken. Sections 10, 11, 12, 13, 14, 15, and 16, of 40 acres each, taken under desert land act. Sections 1, 2, 3, 4, of 40 acres, desired to be located by same party and at the same time as 10, 11, 12, 13, 14, 15, and 16, under the desert land act, but cannot for the reason that the subdivisions are not contiguous.

The desirable water rights here are all taken up in the valleys in this immediate vicinity, and to bring water on the ground requires expensive ditches.

I took up a range early in the spring under the desert-land act, and down there the water is all taken up for a long part of the year out of the Deer Creek, and this has been an unusually dry season; consequently there has been a great deal of quarreling among the neighbors there about their water being scarce.

Owing to the scarcity of water some grain planted died for lack of water, and the neighbors quarreled over it. A great deal of ill-feeling sprang up on account of one shutting off another's water supply in order to procure enough for himself.

The theory is now that when a man takes up water rights he is entitled to the first right, or all he wants, and the next man is entitled to what that first man left, if he wants it, after the first is through. There is hardly any law here; it is merely custom; it is first come first served. I think there ought to be a law which would define each party's rights so far as the water is concerned. There was a case right there on the creek where a party on the head of it was located, and he had so diverted the water that it did not run back into the creek, and the rest of the people in the neighborhood tried to force him to do so.

I believe in the square location in mineral lodes. It will save or stop half the law-suits in existence. I believe in a general mining law for the United States, and I believe in the register and receiver of the land office having jurisdiction over the timber and mineral lands. In my official capacity I see a great deal of charcoal and wood, and I feel confident the parties who made it did not pay a penny for the timber used.

I think the original locations in mines ought to be filed in the district land offices. I think the government, through its officers, should control all this land.

For the year ending June 30, 1879, the production of the mines was about \$2,500,000 in gold and \$3,000,000 in silver. I think there will be an increase next year, but it will depend entirely on the water; for placer-mining is slowly falling off, because the ground is being worked over and so much land is being held and not worked. I think a man ought to be compelled to pay for a placer-mine and work it.

I estimate that the yield for the next year will be \$3,000,000 in gold and \$3,250,000 to \$3,500,000 in silver. I think the estimates heretofore made have been high.

---

*Testimony of S. F. Hauser, president of the First National Bank of Helena, Mont.*

S. F. HAUSER, president of the First National Bank of Helena, Mont., testified at Helena, September 27, 1879, as follows:

I am a mine-owner and capitalist; I have lived here sixteen or seventeen years. I have heard the statement just made by Mr. Holter, and I corroborate it in nearly every respect. I think he is wrong about these pasture lands. I believe in the pasturage homestead, and I believe in protecting the cattle settlers to the extent of their herds. It will prevent litigation, trouble, and fighting. I think the land is worth about 20 or 25 cents per acre.

I do not think the increase of rain amounts to anything. I think it is absurd to build expectations upon an increase of rain.

---

*Testimony of L. H. Hershfield, Helena, Mont.*

L. H. HERSHFIELD testified at Helena, Mont., September 25, 1879, as follows:

I have lived in this country sixteen years, and I know all the country pretty thoroughly. Those lands in the Territory that cannot be irrigated, of course the best thing for them is to leave them just as they are, and leave them to the stockmen. I think, if they must be sold, I would allow each man to take lands to the extent of his herd. If the government retains possession of the land, and permits the stockmen to use it, I do not see any difficulty about it. There is a difficulty if men are permitted to buy it in unlimited quantities. Then the large man will have all he can possibly get, by buying, borrowing, or stealing. He will certainly get it all some way, if you allow him to purchase it. I would not lease it. I would let the land be in possession of the government, just as it is now, and the government ought to decide what is the character of these lands. All our high lands in the Territory, even the second-bench lands, would be grazing lands, and all below that would be irrigable lands.

It is a very serious question for the government to determine what these lands are; they are being consumed too rapidly; and whereas all these lands are held in trust by the government for those who come after us, it should protect them and guard them well and not allow any primogeniture—the first son to get all there is. Our lands are all good; for instance, the whole tract of land that lies around here. It takes considerable money to get a ditch on that land, but the time will come when a colony will form here and, by putting the water on this land, fully utilize it. I know of just such a place now. It will be a pity to dispose of that land under the desert-land act or any other act. Leave it to those persons who want to make homes of it. It is not necessary to survey it. Just leave it the way it is, holding it under possessory rights. If a person has 50,000 or 60,000 head of cattle, occupying a region 100 miles square, his cattle will herd in one direction, another man's cattle would herd in another portion within the same boundary; but if you go to work to establish metes and bounds for cattle ranges, other stock coming there would be trespassers, and the occupant would have the right to exclude them, because he would want to keep his grass fresh, and where would you be if you adopted a law of that kind?

They have land in Colorado now, and in this Territory, that is unfit for agricultural purposes even if you could get water on it. Take all that northern part of Colorado lying east of what we call the "cut-off" from Denver north. Take it along the Rio Grande, although the country is very good pasture land, at the same time it is unfit for agricultural purposes.

Now they are taking up land in the Yellowstone, under the desert-land act, which is not desert land. That is an injustice to the people who will come to settle on these lands. I would repeal the desert-land law for a country like this; but there are portions of the country, down on the Gila, that it would apply to. I am not in favor of the pasturage homestead. I would let the present law apply. Let the government encourage these pasturage interests, but do not dispose of the lands, but let the government own them and the people hold them by a possessory title. The land is now held by mutual consent, and it is well enough.

I do not favor the selling of these arid lands. If surveyed and put in the market they ought not to be sold for more than 12½ cents per acre, and if they were sold I would limit the amount of each settler to 5,000 acres.

In this matter of land the timber should be carefully considered. There are two evils resulting from the destruction of the timber; not only the destruction of the timber itself, but the change of climate which it produces. I do not know what suggestions to make on this subject; it is a very serious question.

There is another law that should be enacted and a very severe penalty attached for any person who sets the timber on fire. It would not be a bad idea to survey the timber in tracts of 160 acres, and reserve to the government each alternate section. It will take a thousand years to put this timber back when once it is destroyed. It is a matter of great importance. We lose timber, and we lose our rain. I think it will be better for the district land department to have charge of the timber.

The great fault with the placer-claim law is that it does not limit individuals to a given area, and does not force him to work it. That is the chief abuse. A person ought to be limited to the number of claims they are entitled to, and the matter regulated in the same manner that pre-emption and homestead locations are. As the law stands now a man can take up a piece of land here, and another piece there, and there is no limit to the number of claims a person can enter. They do not work these claims, but just hold them for speculative purposes. In such cases the law should compel them to work the claims. They do not have to pay on the placer claims, and they do not do it. I am in favor of the government being very generous to placer men; allow them to get one piece of placer land, to make the selection of it, but that is all, and then they should lose their right just as they now do in agricultural land cases. I think that the interests of the public and the government would be subserved by permitting agricultural and irrigable lands, such as there are in Montana, to be taken under the present system of location in tracts of 160 acres under pre-emption and homestead filings, and do away with the desert-land act giving 640 acres, the second-bench lands to be held in common for pasturage purposes.

---

*Testimony of Anthon M. Holter, lumber and cattle dealer, Helena, Mont.*

ANTHON M. HOLTER testified at Helena, Mont., September 27, 1879, as follows:

I have been in Montana sixteen years. My business is that of a lumber, machine, and cattle dealer. My principal business is lumber and hardware. I have three mills. One mill is located on Three-Mile Creek, in this county, and I have another mill in Jefferson County, and I have half an interest in another mill in Jefferson City, and also a half interest in another mill in Jefferson County. We are probably the largest lumber dealers in the Territory. We cut the timber from the public lands. I have no title and no land from which we cut the timber. We pay the stumpage. A timber agent named Nolan, appointed by the Commissioner of the General Land Office in the winter of 1877-'78, gave us notice that he had to seize our material which we had cut. The agent gave us no chance to pay for it. He put a man in charge of the lumber here, and at the time I went to see Mr. Anderson, the district attorney; he seemed to be considerably in sympathy with us, and advised settlement, but did not know on what terms it could be settled, and wanted me to make a proposition. It went on from day to day. I saw him a good many times, and he advised me not to telegraph my Congressman; but I did send several dispatches, and got answers to some of them. He did not make any proposition to me to settle the matter, and I did not want to make any proposition. He told me from day to day that the matter could be settled. He wanted me to call at his office. He said the matter could be settled, but did not say just how. This lasted for thirteen weeks from the time our lumber was seized, and stopped us doing business. This was much to our injury and detriment. Of course a complaint was in court, but there was no indictment. Before it came to trial a proposition was made by the attorney. His first was that we could settle it if we would pay \$10 a thousand feet. We sell the lumber at from \$15 to \$25 per thousand. At that time we were selling it for less than that. He wanted us to pay \$10 per thousand taxes on that, but after correspondence with Major Maginnis, the district attorney then said he had instructions to settle it for \$2 per thousand feet. We paid that amount, and that settled it. Besides that we paid the costs in the case. It did not injure us so much, as it was in the winter time, but it cost us between \$1,000 and \$2,000.

I am well acquainted with the timber land in Montana. It is Georgia pine, spruce, hemlock, and yellow pine. There is no hard wood in the Territory. There is some coal here not yet developed, but I think there is not enough to supply the people with fuel. A great deal of the timber is of small growth. It is not profitable to manufacture into lumber, but it is good for fuel. Not more than one tree in every thousand of the tim-

ber here is fit for lumber. The timber here is of slow growth, as near as I can judge of the age of a tree. I counted one tree this summer, which was 20 inches in diameter, and which had 140 rings. The rings were close together. Where the timber is entirely cut off, in the new growth it makes a vast difference whether the large trees are culled out from where these young trees are growing. We hardly find a large tree for saw-logs but what it is rotten inside. That shows that it grows to a certain age and then dies. Pine occurs more heavily than spruce, and there are very few trees that we cut 2 feet in diameter but what are rotten, more or less. Eight out of ten of them are much damaged from this cause. A great many timber trees are left standing because they are damaged. I think the average age of spruce and pine here is about two hundred years; that is, to the best of my knowledge; I cannot say accurately. I have seen spruce trees here occasionally 4 feet across, but I do not know how old they were. They are not made use of for any purpose; they cannot be cut into cordwood and are not fit for lumber, because they are too knotty. When the timber is cut off it reproduces itself. There is considerable undergrowth here that is growing up into trees. The great dearth here is because there is so little proportion of timber that is fit to cut into lumber, because where the timber grows large enough for lumber the trees do not grow thickly. If it was protected it would grow into fine lumber trees. If the timber was not being destroyed I do not think the timber land would increase, even if there was no cutting out and burning or destruction.

I think the timber of the Territory is getting its maximum of growth. I think all the timber that would grow is grown and is growing now. My reason for that is this: When I first came to the Territory it seems to me that vast fires were more numerous then than now. Lightning does not seem to strike the trees now as it used to do. Since the country has become settled we are able to control small fires in the timber before making headway. The other day a fire got out somewhere in the timber; my men at the saw-mill stopped right at once and worked until they put the fire out. If it had not been that there was a settlement near, that fire would have destroyed much timber. I think that settlement in Montana has had a beneficial effect upon the timber by preserving it from fires. It seems to me a hard question to decide what shall be done with this timber. I have thought of it for years past. I have spoken to the United States marshal on this subject for the last ten years often, but I really have not been able to mature any plan yet. I do not see how the government can put it into the market, for this reason: that there are only two things that timber will be used for, one for fuel, and the other to cut up into lumber for mining and building purposes. This is all it will be used for.

The plan upon which the business has been conducted is like this: A man who has a saw-mill gets the timber adapted for his mill. The choppers who go into the wood-cut for both lumber and fuel. They cut over a piece of ground, leaving for fuel what is not wanted in the mill. The timber that is fit for saw-mill lumber is so scattered that when a man plants a saw-mill he generally has to go miles and miles, and take here and there, and allow the rest of the timber to stand. A man cannot buy a large amount of timbered land anywhere near enough to supply his saw-mill. On my land in Missoula County the timber grows in thicker bodies. I would rather buy the logs of individuals than to hunt them up.

Question. If the land was sold by the government to individuals, to be their property for the purpose of cutting the logs, would they not care for the timber more than if they were allowed to camp here and there as they are now?—Answer. No. My reason is this: Probably farmers would be compelled to buy land for fencing, &c. Now, they live miles away. They cannot pre-empt it because they live down in the valleys, and timber speculators would step in and buy it, and other classes of men who do not lay out at night to watch fires. I think it is impracticable to sell the timber land, but I have no plan to suggest as to the disposition of it. I think if the government charges in any way, shape, or manner for cutting wood, that it should be left principally to the land office here. I do not see that the land office here should not have charge of the matter. I do not make this statement for the purpose of avoiding the payment of any just dues to the government. I am willing to pay, but there is one thing I will object to, and that is this: When a saw-mill man wants to put up a saw-mill anywhere he must keep as quiet as possible, simply for this reason, that some man will go in ahead of him and cut the lumber down, put his own marks on it, and make the saw-mill man pay his price for it. It is the usage here that the man who fells the tree owns it. They go ahead of the mill man and fell the trees and own them. There was a grove of timber about 25 miles from here that was cut down two or three years ago. It amounted to between 400,000 and 500,000 feet of splendid lumber. The timber has been lying there ever since and not sawed up into lumber. It is not rotten yet, but it has not done it any good to lie there. This last spring I bought the timber of the parties who cut it. They did not pay any stumpage to the government to cut it; and this is where I do not think we were rightly served when we had to pay the stumpage for those trees. We paid out to the men who cut them down. The parties who cut the timber ought to be compelled to pay the stumpage, and not the purchaser. We bought this lumber last spring. We are sawing it up now. We would rather have

taken the trees standing because it makes better lumber. It is the usual process here to sell timber and then hold it.

Mr. Brown started over in these hills beyond, down on the Benton Ridge, and cut a few hundred thousand feet; that is, cut the trees down. He tried to sell the trees to us after cutting them, but we were not in shape to buy them at the time, and he tried to sell them to others. I offered to lease him a saw-mill if he would saw it into lumber and bring it into town, and I would then buy it of him; but we never made any bargain. That was five years ago. It was good lumber, the trees probably averaging 150 years old. I think there was about 400,000 feet of lumber. He finally succeeded in getting a man to go in there with a saw-mill, and they sawed a portion of it and then they separated, and the rest of the lumber is lying there now. I do not see any reason why the lumbermen should not be compelled to pay a license just like men who are manufacturing whisky. If the register and receiver had charge of the timber land in this district they would know the lands that have been mapped by the surveyor, and would know where the timber lands were that were fit to cut for lumber, and they would give a license to the proper mill men to cut the timber on the public lands, and the mill men could show them where the timber was located that they wanted to get. In that way they could control the destruction of the timber on the public lands. If the government desires to make money out of the timber I think that would be as good a plan as can be suggested. I think the question of timber ought to be settled as soon as possible; but, whatever is done in that respect, I think these people should have due warning beforehand, for this reason, that cord-wood or timber is sold just as though it was seasoned. The parties dealing in it are not making any money because they are getting it for nothing, and competition is just as great as it is in merchandise. The license would have to be paid by the people, and it would make no difference to the dealers.

Q. Has there been any timber planted here?—A. I do not know of any timber planted in this Territory. I do not think timber culture would be a success in Montana.

Q. Have the rains increased since you have been here?—A. I think the rains have increased to some extent.

Q. What kind of country do you consider Montana to be?—A. I have been pretty well over Montana, and I consider it a grazing and mining country. All the land has to be irrigated that is used for agriculture. Agriculture is profitable here, more than in the States I think, because of the markets. I think that one-twentieth is a very heavy estimate for the irrigable land in Montana. The country is largely pasturage because of the grass, and I think the wealth in the future will probably be cattle and sheep. I think the sheep and cattle question is pretty well settled here now by common consent. If the country belonged to me I would sell all I could of it. I think it will be well to allow a man to take as much land as he has stock. I am not much of a stockman; but I think there should be some system whereby the present actual settlers could be protected. We have had some little forerunner of trouble in regard to the water rights. I do not think we have any system of water rights here. There is nothing that is really settled. This summer we entered some land down here, and just as the grain was growing and we wanted the water, somebody else came and cut a ditch and took the water. The strongest man usually gets it. The rainwater has increased slightly, but I have not seen any more acres cultivated because of the increase of rain. There have been seasons that were favorable to raising crops without irrigation, but more that were not.

Q. Have you any interest in mining or any suggestions to make concerning mining matters?—A. I am a large mine owner and locator of quartz lodes. I think it will be well to have a square location in mines. It would stop litigation and quarrels. I am afraid though that the square would not operate well in lode mines. Some suits have originated from the difficulties of ascertaining what is the true apex of a lode. I think the whole business of locating mines ought to be done in the district land office.

There is one thing I forgot to speak of about timber. It has been the practice here to some extent to try to hold timber under mineral claims. They all go to the mining recorder's office, and get entries to lands simply for the purpose of holding the timber. Whatever is done to the timber, I think the timber rights ought to be separate from the mineral. In cases of real mineral location I would give the locator the timber on the top of the claim for mining purposes. Where there is timber on a mining location that is not previously located the timber should go with the land, but where there is a previous claim to the timber that claim should be respected.

I think that the mining laws should be so amended that the attorney in fact could perform all the duties of the claimant himself, after the location has been made. Simply by advertising sixty days a person is debarred from filing an adverse claim; I do not think it is a good idea. I think a person ought to be notified personally as well as by publication. My brother on one occasion happened to see the publication notice in time to allow me to make an adverse filing, otherwise I would never have seen the notice and would have been subjected to loss. I think it would be a good thing to do away with all local laws and use the United States laws.

*Testimony of James E. Kauouse, farmer, Meagher County, Montana.*

The questions to which the following answers are given will be found on sheet facing page 1.

CENTREVILLE, MEAGHER COUNTY, MONTANA, October 1, 1879.

*Public Land Commission, Washington, D. C.:*

GENTLEMEN: In reply to letter from Department of the Interior asking information upon subjects to be reported upon by your Commission, I have the honor to submit the following:

1. My present occupation is that of farmer and stock-grower.
2. Have lived in Montana thirteen years.
3. Have acquired government title to 160 acres land under pre-emption law.
4. Have assisted many of my neighbors in matters connected with entry of their land under homestead, pre-emption, and desert-land acts.
5. When land office was first opened at Helena, Mont., fees at the office for pre-emption or homestead filing were from \$7 in pre-empting to about \$15 for homestead filing (uncontested cases). Think it has always required about one year to get returns from Washington in matters connected with Land Department.

The requiring a "non-mineral proof" has added largely to the expense of entering land. I look upon the requirement of publication of notice to miners a big item of expense; as totally unnecessary. In requiring non-mineral proof the department has put the "cart before the horse" so far as the lands of Montana Territory are concerned; for they should all be deemed and held to be agricultural and pasturage lands until proven otherwise, and not *vice versa*.

The cost of a contest in the United States land office at Helena, where parties went from here, forty miles, with three or four witnesses each, that came under my observation was about \$200 for each contestant. Decision of land officers here was in favor of the actual settler, but on appeal to Washington he was counted out.

In another instance a party made an entry under desert-land act of unoccupied desert land as defined by the act of Congress. Another party, coveting the land, filed a petition and affidavit with the land officers asking to contest the fact of the character of the land as desert land. The party making entry having no money to spend in contesting, withdrew filing and filed a pre-emption on 160 acres same land. The other party (No. 2) then made application to enter the same land under homestead act. (Application entertained and trial ordered by local land officers at Helena.) To avoid expense party No. 1 sells out to No. 2 for nominal figure. Such cases would seem to indicate some defect in the working of the law under the rules of practice laid down by the Land Department at Washington. It would seem that opportunity might be accorded to whom it might concern, upon the original filing of a notice of intention or settlement, that such settlement once *made of record* at the land office should bar the receiving of applications to enter the same land by other parties until the expiration of the time allowed by law within which to make final entry.

7. The public lands of Montana may be divided generally into mountain and valley lands, or perhaps a better division would be to say mountain, foot-hill, and valley lands. Valley lands vary in width from 1 to 4 miles generally, and lie contiguous to the larger streams of the Territory. An exception is Judith Basin, estimated by one of my neighbors at 150 miles in width. This class of lands is never mineral, and is always agricultural and pastoral—can think of no exception. Have seen most parts of the Territory, but never saw an instance where such lands had any timber, with the exception of a fringe of cottonwood on the islands and banks of the largest streams.

The foot-hills lie between the valleys and mountains proper. They are *pastoral lands*, and whenever they present a level surface (with such grade that irrigation will not wash away the soil) and a supply of water for irrigation can be obtained they are agricultural. They have no timber beyond a few scrubby cedar. Think exceptions to last statement occur principally in Missoula County, where all timber, and particularly cedar, does most abound. The beds of small streams and gulches, before they debouch from the foot-hills, also the "bars" formed on the sides of such gulches, are sometimes gold-bearing—instance: Bannack (Grasshopper Creek), Virginia City (Alder Gulch), Diamond City (Confederate Gulch), Helena (Last Chance Creek), and most if not all placers. The towns themselves are situated on what I have denominated as mountain land, but the pay dirt extends from thence to the foot-hill lands, as described.

Mountain land is timber land, except when laid bare by fires. It is not agricultural and is not pastoral. Upon it are found ledges of gold, silver, iron, &c. It is mineral land. Upon it snow falls deep in winter, with rain in summer, when at the same time the roads of the valley 10 miles away are dry and dusty.

8. By general rule.

9. Don't know that I entirely understand this question, but think that all valley and foot-hill land should be surveyed and plats filed in land office as soon as practicable. Reason: All valley and much foot-hill land is filling up with homes of permanent settlers. See no immediate necessity for the survey of mountain land further

than the running of such lines across the ranges as may be necessary for surveyors in surveying mines or organized mining districts.

10. Think present system a good one. The desert-land act, in wise hands, might be much improved. No suggestions prepared.

#### AGRICULTURE.

1 and 2. For reply to questions 1 and 2, please see Straborn's book, "Resources of Montana." Creeks are usually high at commencement of irrigating season, but fall by July when water is still needed.

3. None.

4. All such land as I have previously spoken of as "agricultural." Estimates of its amount vary from 16,000,000 to 25,000,000 acres.

5. Wheat, oats, and barley are the principal crops. All hardy vegetables do well.

6. Seventy-five inches of water, measured under a 4-inch pressure, will irrigate 100 acres of grain in an ordinary season, giving the land three wettings.

7. In this immediate section (Missouri Valley, Meagher County) supply of water is obtained principally from small creeks flowing from Belt Mountains to Missouri River Valley. A few ditches are taken from the Missouri River. The latter are expensive.

8. From observation and experience, think irrigation adds to the fertility of soil. A few farms have been located some 10 miles from the valley, close to the timber line on the mountains. Have raised fine crops. Should think the altitude close to 5,000 feet, or some 1,200 higher than the valley.

9. All water turned into irrigating ditches is exhausted. An act passed at last session of legislature requires *prior appropriators of water* to turn same back into main stream when not needed by them for irrigating purposes upon notice from parties next in order of priority that the water is needed by them.

10. The water supply from small streams (where ditches could be made at slight expense) is all claimed, though early in the season there is a large surplus. In some localities the first settlers recorded at county clerk's office their claims to so many inches of water, in others they made no "record." The right of priority in claim and use of water was usually recognized among the settlers; laws since passed upon the subject of "irrigation and water rights" have been indefinite and unsatisfactory in many respects and while it is a subject of vital importance to the people of an irrigating country there is no subject the legislation upon which is involved in so much obscurity and doubt. An act of Congress is needed defining "rights" hereafter to be acquired and defining and requiring proof of and the placing upon record of all "rights" acquired before the passage of a law on the subject.

11. A low stage of water during the summer usually brings in its train more or less litigation upon this subject.

12. About four-fifths of land in this valley, having no water, is fit only for pasturage.

13. I doubt the wisdom of allowing settlers to enter land in larger tracts than is authorized by present laws.

14. It is not advisable.

15. Whenever the cattle number more than one head to 5 acres the range soon becomes eaten out. This section does not differ materially from others in the Territory.

16. One hundred head, if they subsist solely by raising beef for market.

17. Making a rough guess, would say from eight to ten head.

18. The present season there has been no rain and growth of grass has diminished. A very wet season would make the range as good as ever.

19. No, no.

20. No.

21. There are good-sized creeks from six to ten miles apart furnishing an abundance of water for stock.

22. Can't answer from my own knowledge, but should think about four head.

23. Think answer to question 18 will apply here.

24. They will not.

25. Cattle men complain that they are compelled to move their herds when sheep are brought upon the range they occupy.

26. In 1878, cattle in the county numbered 30,520 head, and sheep 34,617 head. My estimate now would be one-half more cattle and double the sheep. Sheep are herded in flocks of 500 to 2,000 or 3,000 head; cattle are never herded.

27. No suggestions except as to timber and timber lands.

28. The survey lines sometimes have jogs of 3 or 4 rods in them and in some few places corners are hard to find. I also notice in many places that the only mark for a corner is four shallow holes in the ground; these in a year or two will be completely obliterated.

#### TIMBER.

1. The only timber land is on the tops of the mountains, in this section should think the proportion about one acre to 100 acres of other land, and of the area named less than one-tenth is suitable for any use except fire-wood; kinds of timber are pine and fir.

2. None planted.

3. I would have title retained by United States. Allow actual settlers to cut timber for all purposes except speculation, provide that all title or right to all timbers cut and left as they fall or piled shall if they are not hauled or used within one year revert to the United States and be subject to appropriation the same as standing timber: it would tend to prevent speculation in and a great waste of timber (fence-poles piled and left in the timber will rot in two years).

4, 5, 6, and 7. Enact stringent laws with regard to setting out fire on the ranges or in the timber.

8. The most valued of timber by the agricultural population are the places known as "pole grounds," where poles suitable for fencing grow in dense thickets. The custom has been upon the discovery of one of these places for a number of settlers (any one desiring to) to turn out with teams and make a road to the place for wagons and then to cut and pile such timber as they estimate they will need for a year or two. Their right to the felled timber is recognized by local custom. Much timber is wasted in this way.

9. I think they would be, but it should be borne in mind that United States district land officers as a rule are changed every few years, and their places filled by men having no previous training for the position, often young clerks or "men about town" who have been of service to an M. C. but who have no peculiar fitness to act in a judicial capacity. These remarks will also apply to question 20, under head of "Lode claims."

Not being a practical miner my answers to questions upon mining subjects would necessarily be founded upon hearsay to a great extent. This, together with want of time at present, must be my excuse for closing.

I am, gentlemen, very respectfully, your obedient servant,

JAS. E. KANOUSE.

*Testimony of Walter McDermott, mining engineer, Lewis and Clarke County, Montana.*

The questions to which the following answers are given will be found on sheet facing page 1.

Answers to questions submitted by the Public Land Commission.

1. Walter McDermott; residence Belmont Mine, Lewis and Clarke County, Montana; occupation mining engineer.

2. Have resided as above for one year and a half.

3. Have located and recorded several mining claims as agent for others under the general mining law of May 10, 1872; and as attorney for others have executed all work and papers necessary to the obtaining of United States patent for two mining claims and three mill-site locations.

4. The opportunities offered in inspecting mining properties and titles and other professional work in Colorado, Utah, and Montana.

6. Am familiar only with practical working of laws relating to mineral land, and defects observed under subhead "Lode claims."

• LODE CLAIMS.

1. Experience in Colorado, Utah, Dakota, and Montana, inspecting and reporting on value of gold and silver mines, and in managing same.

2. Chief defect in present laws as to lode claims, and origin of nearly all litigation within my experience and knowledge, is the false assumption that mineral deposits are regular in form and character, occurring solely as a conventional "true fissure vein," and therefore contained within well-defined and easily ascertained boundaries. A large proportion of the most valuable mineral deposits of the West cannot by any means be described as fissure veins; and the attempt to do so in order to apply the present mining laws leads to such inconsistencies as the defining of a great bed of limestone a "lode" within the meaning of the law; and the opposite statement that a detached body of mineral within the same bed is also a vein or lode. No law based on any ideal form of vein or deposit can ever be flexible enough to cover the many different forms of the occurrence of mineral; and any law, as the present, so based must be necessarily fruitful of litigation and injustice.

4. I understand by the term "top" or "apex" of a lode that portion of the lode along its course which outcrops to the surface, or, if "blind," which comes nearest to the surface of the earth. Neither the apex, course, nor dip of a vein can always be determined in the early openings.

5. The intended rights of a discoverer are therefore in cases curtailed by such failure to determine above points.

6. Within my knowledge litigation has grown out of this.
7. I have known of such cases.
9. I do not believe outcrops of "lodes," in the proper sense, to be often if ever wider than present legal width of claims under general mining law; but taking the modern comprehensive definition of the legal "lode," which may be stretched to cover a strata of rock several thousand feet in thickness, it is likely to occur.
10. I know of no case, but can readily conceive it with certain surface contours.
11. To the disadvantage.
13. Many discoverers of rich veins and their assigns are. The attack is frequently directed to the portion of the vein dipping beyond the side lines.
14. In my opinion it is utterly impossible.
19. All district mining laws and customs could be at this date very advantageously abolished, and a general comprehensive law introduced in place; but if district records be abolished certain undeveloped unsettled portions of the West will be without facilities for the first discoverers of mineral to obtain titles by the preliminary step of recording. In all settled districts the United States land officers could with advantage to the public keep all mining records.
21. I would make surface lines vertical in depth the true and only boundaries; everything within the four sides on surface or to any depth the property, undisputed, of the owner of the claim, with no right to work beyond vertical planes drawn through the surface lines. It would be necessary to increase the present width to perhaps 800 feet in order on flat dipping veins or beds to give sufficient depth for working, with the right to take the location on surface either wholly on one side of the vein or part on one side and part on the other. There should be more stringent laws as to the proof of a vein being actually discovered before record is permitted. The recording under affidavit of discovery should secure possession to the locator for a short period necessary to prove the course and dip of the vein or nature of the deposit, say ten days, by which time he should be obliged to distinctly mark the four corners of his claim, and no subsequent change of boundaries be permitted, unless the claim is too large as found by regular survey. No arrangement can be made to absolutely secure a first discoverer from locating a claim partially to his own loss, since the nature and run of some deposits take years of work to find out, and later locators have their rights. In regard to the extension on the dip of a vein already located, the record and location should be made avowedly as an "extension on the dip," and in such case proof of a vein existing being impossible, the point of representation by *bona-fide* sinking and exploring should be enforced somewhat as in the case of a "tunnel right" under the present general law. No claims should lap on surface, and in such case, with vertical planes, no litigation could occur in working below.
22. Considering the expense of obtaining patent, the poverty of many prospectors, and the fact that in many places they can do representation work required though unable to meet the outlay for patent, the limiting of possessory title would work some injustice and lead to the custom of letting titles lapse and relocating to evade the law. The benefits at present attending a patent as compared with possessory title are sufficient inducement to insure the change from one to the other whenever the property concerned is of any real value. An immense majority of mining locations are perfectly worthless; but in this connection I would suggest the necessity of some regulation to prevent the custom of avoiding *bona-fide* representation work by relocating property directly after the expiration of the legal limit within which such representation work has to be done.

*Testimony of J. H. Moe, register of the land office at Helena, Mont.*

J. H. MOE, register of the land office at Helena, Mont., testified, September 24, 1879, as follows:

So far as the voluntary relinquishment of cancellations is concerned I think it should be done here in this office; in fact, all cancellations ought, I think, to be done here; it would certainly expedite the business of settlers. I think the register and receiver should have more authority than they now have; I think they ought to be permitted to subpoena witnesses and perpetuate testimony.

I favor the abolishing of the mineral recorders and putting their business under the district land office, provided that a proper compensation be allowed.

I think the timber land should be surveyed and sold. From my knowledge of the timber lands in this country, I should say it should not be sold in tracts to exceed 320 acres. If they were permitted to buy it, I would allow them to do as they pleased with it afterward; I should charge not less than \$2.50 per acre. When I sold a man a mine I would sell him all the timber on the ground and give him jurisdiction over it. I don't think the district land office ought to have anything to do with depredations on the timber land; they are not in a position to attend to it, and it should be done by the United States district attorney; I think it should be attended to by other parties.

I think there should be some method devised by which the decisions of the General Land Office could be communicated to the different district land offices. It takes too long to obtain a patent to agricultural land ; sometimes it takes a year and sometimes seven years to get a patent to agricultural land, and for mining patents it takes from sixty days to three years.

In the matter of permitting the relinquishment of land, I think there are two sides to that question. I can homestead a piece here and keep it for five years, and I can go off and enter another one, and so on. In some instances this would injure the ground and in some other cases it would not, but when a man has completed his title I think it works evil to him.

There is a case in Deer Lodge. A man with thirteen children lived on his land but did not file on it. After living there, I think, about six months or a year, his family were all taken sick. His wife died, and he came in here to make his filing perfect. After hearing the case I allowed him to make filing. He had a certificate from the surgeon that his wife had died upon this homestead, and the surgeon advised the removal of his family and house about one hundred and fifty yards to higher ground. He built a house and lived there with his family and continued to improve this homestead all the time, had it fenced, cut hay, &c., and on this proof I allowed the filing entry, but sent it on to the department, and they set it aside, simply because he had not resided on the ground. This is a case where it works great injury. The first filing of the declaration of homestead should not work forfeiture of the right. Notice of filing entry, I think, should be abolished immediately. I think that the forms of the Land Office could be immensely consolidated and condensed to the benefit of the public and department.

Concerning pasturage homesteads, I am not clear about it. I would like to know a little more about it before expressing an opinion.

As regards the proposition that in the matter of land that cannot be irrigated the present homestead law should be extended to enable a man to take up three thousand or more acres, instead of one hundred and sixty, of this arid land for a pasturage homestead, I don't think favorably of the idea, for I think it could be disposed of to better advantage. The land ought to be disposed of in sections of 640 acres, sold at \$1.25 per acre. The best you can do for a stockman is to enable him to get a home range, for they will not buy the whole territory if they could. They will only buy enough to control certain water rights.

In regard to the sale of these pasturage lands, it might be well to sell them in small tracts, but I am not in favor of a pasturage homestead.

There is much complaint about finding stakes and boundaries. It is owing to the decay of the stake and the imperfect manner in which the work has been done. I think it is not owing to the insufficient pay, but only to the slouchy work. This imperfect work was done before the reduction in the price of work. I think the reduction of pay has not tended to remedy this defect. I base my views in this matter on the reports and opinions of other persons. I will give an instance. We found last week parties wanted to locate in the Judith district. They went down there to look for stakes and could not find any. They came back here and employed a surveyor for \$100 for the trip and his expenses. These surveys were made in 1875 and you cannot find any of them at all. You would not have expected to find any of the stakes placed by one of the deputy surveyors, but those put in by some of the other men you would. I think there should be some means of establishing permanent monuments at the corners of each section.

Surveys are often made too far in advance of settlement. For instance, Judith district was surveyed five years ago, and there is not a settler in that district now. Thus the stakes become obliterated and the townships are of no use. We had eleven townships surveyed out here in the Muscle-Shell Valley, and there is not a filing on it. From the complaints I should not think they receive enough, but practically I have no knowledge concerning the matter.

Question. Do you think that during the last two years the surveys have been made in advance of settlement?—A. I do not think that the bulk of surveys of the last two years have been made too far in advance of settlement. The surveys north of Butte were made, some of them, in accordance with instructions from the department. To have the survey extended down into Willow Creek would be needless.

I do not think the desert-land act ought to be repealed, nor do I think that it has been abused, and inasmuch as the homestead act contains a pre-emption clause, I do not know of any reason against repealing the pre-emption act.

There is another point. I think the register and receiver ought to be allowed to take testimony, thus saving much loss and trouble to the settlers. I believe in extending the same rights to the final pre-emption as are extended under the homestead act.

In placer claims I think there ought to be a limit to the final entry, but in lode claims I do not think so.

In the matter of the sale of delinquent rights in mines, we are governed by section 2324 of the Revised Statutes. We have no local law on the subject. In connection with this local mining business I think the law ought to be amended so as to allow an adverse claim to be filed by the attorney in fact instead of by the person himself. The law should be so amended that the attorney in fact may be allowed to do everything—the notice of intention and posting included. It has been so here until this month and was never questioned. In certain cases before this office application was made by the attorney in fact on behalf of the parties, then absent in the East, to transact the business of their clients. The Land Office at Washington attempted to set aside the action taken by the local office here, the Commissioner ruling that attorneys in fact could not appear for parties who were absent. I do not think the Secretary of the Interior will sustain the Commissioner's office in its ruling.

There are no conflicts here between cattle and sheep men, although I know very little about that. My opinion is only from hearsay. Neither am I familiar with the system of irrigation and its workings in this district.

I think there should be more rulings made by the departments, and I think they could give better instructions.

I know of no better way of disposing of the public land than through the register and receiver. I think the present rectangular system of disposing of the land is simple and effective.

I think the register and receiver of the land offices should receive a salary instead of fees.

The additional homestead act of March 3, 1879, should be amended, so as to allow parties to take an additional homestead, though not contiguous to their original entry. There should be a register and receiver's fee of \$6 in each case.

The timber-culture entry act of June 14, 1878, should be extended to the Bitter-Root Valley lands. There is a separate cash entry kept of sales of those lands, and the proceeds go to the Flathead Indians. By the act of February 11, 1874, the homestead privilege was extended to these lands.

As regards surveys, I think there is a point. Where there are no surveys between distant surveyed points, I think that the rectangular method should be used to locate points for the settler. I think there is one such case now, where it will be necessary to run 20 or 30 miles of chain in order to locate a point.

There is another idea that seems to me could be carried out. It is to have a portion of the appropriation of this district set aside for surveying those small fractional townships which are outside of the regulation survey.

There have been 277 entries made since April 1, 1877, and most of these were along the streams. If the square location will destroy litigation I am in favor of it. It would, of course, work a hardship to some persons. We have 522 mines patented in this district. We have had 722 mineral locations. There are 200 applications in this office from parties who have not made their final entries. This is owing to a defect of the mineral law, as that does not require miners to make their final proof in a specified time.

In regard to placer claims, there is neither a United States nor Territorial law compelling a man to complete the entry. They file the application and leave it. We have about 100 placer-claim applications. They ought to be compelled to make their final entry. They just make their claim and hold it. They do not work it. With lode claims it is different. United States law gives them possessory title, and if they do not choose to have a patent issue and get an absolute title they need not. It would be better for all parties if they were compelled to make final proof; but if a person chooses to hold it under a possessory title he can do so. It is absolutely impossible for a deputy surveyor to make accurate returns concerning the mineral character of lands. He is better able to determine the character of the soil. A deputy surveyor sees a cropping of coal, and on the strength of the cropping he returns all the land in the vicinity as coal land. I think the best way to determine the character of the land is to determine its character when you make its final proof.

I think the trouble regarding inaccuracies in survey maps is that the clerks are slouchy. They do not take the trouble to put down the topography as returned by the deputy surveyor.

I think that about one-sixteenth of the lands in this district can be irrigated. A large portion of the lands surveyed in Montana are simply arid land. We have 490 township plats in this district, and of these there are many of them that have not a settlement in them. That land should never have been surveyed and subdivided.

---

*Testimony of John T. Murphy, Helena, Mont.*

HELENA, MONT., September 26, 1879.

1. John T. Murphy, Helena, Mont.; merchant, miner, and cattle and sheep raiser.
2. Have lived in Montana Territory sixteen years.

3. Have filed on 640 acres land under the "desert-land act;" have not yet sought to acquire title.
4. Know nothing as to the practical workings of land laws.
5. Have no personal experience or knowledge.
6. Am not sufficiently conversant to venture an opinion.
7. The public lands of Montana are agricultural, pastoral, mineral, and timber lands, and by far the largest area being pastoral.
8. Believe that no general rule would answer for the whole Territory, nor do I think the several classes of land could be fixed as to character by geographical divisions. The pastoral lands in our Territory could be defined very easily as being such lands devoid of water for irrigation, or very difficult and too expensive to put water upon them, and in not having any timber, or but little, upon them. The agricultural lands in Montana Territory, as a rule, lie contiguous to the pastoral lands, and either have water upon them already, or can have water put upon them at not too great cost.
9. Concerning agricultural lands, I think the present system of parceling good enough. Pastoral lands, I think, should be disposed of by the government in large parcels.
10. Think the existing land system good enough, except in regard to the pastoral lands. These, I believe, would bring in a revenue to the government if put upon the market at a low price in large parcels; as now, under the present system, they are not settled upon nor located at the present price required for them, but are used by the stock owners, and without revenue to the United States, Territory, or county.

#### AGRICULTURE.

1. The climate of our Territory is, in my opinion, good; the rainfall not sufficient in all years; length of the growing season short; snowfall not excessive; a fair supply of water in most sections for use on such lands as can be reached cheaply.
2. From the 15th of May to the 15th of June generally, and in large quantity. As a rule the greater supply of water comes earlier than when most needed for irrigation.
3. A very small proportion, and that which can be cold land and not good for cultivation on account of early frosts.
4. Perhaps one-twentieth.
5. Wheat, oats, barley, rye, and most of the vegetables.
6. Am not sufficiently informed.
7. All the streams flowing into the Missouri River on the east side and the streams flowing into the Columbia River on the west side of the mountains.
- 8, 9, 10. Am not informed on these three subjects.
11. Conflicts have arisen among the farmers in the Prickly Pear Valley, Lewis and Clarke County, in relation to water rights during dry years.
12. Fully three-fourths.
13. To some extent perhaps, but limited; think not less than three thousand acres nor more than five.
14. Think to actual settlers pastoral lands should be sold, and quantity not limited.
15. Think perhaps twenty acres in some sections of the Territory, and more in other sections.
16. Cannot answer, not knowing.
17. Do not know.
18. Think the growth of grass has diminished.
19. Cattle ranges are not fenced; do not think it safe to confine cattle in winter by fences on the range.
20. The quality of herds could be improved by being confined to specific ranges, but the same result can be obtained on the range at large.
21. The Crazy Mountains, lying between the Yellowstone and Musselshell Rivers, furnish the water for the range I allude to especially.
22. Am not very well informed on this point.
23. Think the growth of grass has diminished.
24. Cattle do not like to graze on same lands with sheep.
25. No conflicts have arisen between sheep and cattle owners on my range, there being as yet but few sheep there.
26. On the Musselshell Range, Meagher County, I think there are 40,000 head of cattle and about 20,000 head of sheep. Sheep are herded in flocks of about 2,500 head, and the cattle run at large; there being perhaps forty owners for the 40,000 head of cattle and say six owners for the 20,000 head of sheep.
27. Have none other.
28. Do not know.

#### TIMBER.

1. The timber land is confined to the mountains. The different kinds of pine.
2. No timber is planted.
3. The timber lands in Montana Territory are on the mountains, and worthless elsewhere.

cept for the timber. Think these lands or the timber upon them should not be sold or leased, but left free for the uses and benefits of the people at large, who are settled in the towns and valleys, for the following reasons: If sold or leased only a few favorably located tracts would be leased or bought, and these by speculators to sell to the miners and other settlers; while the great area of such lands would not be bought by any one, but would be used nevertheless, and without revenue to the government.

5. The second growth, I think, is of same kind as now exists; growth slow.

6. A great deal of timber is destroyed by fire, and as a rule resulting from carelessness; think it next to impossible to prevent them entirely.

7. Do not think timber has been unnecessarily wasted in our Territory.

8. Am not informed.

9. In some localities, yes; in others, no.

#### LODE CLAIMS.

While I own lode claims, I have too little general information on the subject to attempt to answer the various questions.

Very respectfully,

JOHN T. MURPHY.

#### *Testimony of John T. Murphy, stock-raiser, Helena, Mont.*

JOHN T. MURPHY, Helena, September 25, testified as follows:

I have lived in the Territory since 1864, and I understand it pretty thoroughly. I am in favor of a pastoral homestead. I, with others, located on the Musselshell, where there are about 40,000 cattle, having about thirty owners. We range in the valley of the Musselshell, on both sides, immediately north of the Crow reservation. The people that we keep there are annoyed a great deal by bands of Indians wandering over there. They claim to be Crows and Gros Ventres. They are reservation Crows, but really live there on the river. They number over 1,000 when they are on the reservation. In the winter time when they want cattle they catch ours. This is not the worst of it. There are hostile Sioux Indians who come in there from British America and from Fort Peck Agency. Whenever they are away from their reservation they are hostile; they will steal horses and cattle. Right here, about the 12th or 13th of June, not more than eight miles from the corral, a band of Indians jumped two of our men and got everything they had and shot at them. Last winter they killed a good many cattle and ate them. It is a material matter and a fact that when the Indians are around there we don't know whether to allow them to come up in friendship or shoot at them on sight. I know of many people who have been killed in that way. The Crows are not supposed to be hostile; they are supposed to be friendly Indians. But that country is supposed to be white man's country, and they ought to be kept out of there; they should be located where they belong, on that reservation. The River Crows have never been placed on the reservation, and those who are on the reservation are never restrained at all; they let them leave the reservation. They camped at the mouth of the American Fork last year. It is not an uncommon thing to have men killed and nobody knows who did it. A very large portion of that reservation does them no good. It is not a game country, and they have not got to raising any cattle, so that they do not want it. They ought to be made to wear some uniform or something, so that we would know what they were. Right at the corral there came up a band of Indians who we did not know, but we supposed them to be Crows and Gros Ventres; but since then we have found them to be Sioux. The chances are that these Indians would have killed the whole party; but at the time we did not think about it, but supposed them to be Crows. They said that they were Crows. There was a negro with them, with his hands and feet off, and he said the Sioux Indians cut his hands and feet off when he was a boy, and the Crows took him and raised him and he had been with them ever since. We learned since then that there never was such a person among the Crows. The Crow Indians never have anything to show who they are.

#### *Testimony of Benjamin Franklin Potts, governor of Montana Territory.*

BENJAMIN FRANKLIN POTTS, governor of Montana Territory, testified at Helena, Mont., September 27, 1879, as follows:

I should not think this was entirely an agricultural country. It is only agricultural to a limited extent. There is no land here that I can point to as really agricultural land without irrigation. There has been crops raised here without irrigation, but they are

exceptional. I think one-twentieth for irrigable land is a liberal estimate. There is here much land on the mountains which is irrigable if you could get water on it, but this cannot be done. The bulk of the land is mineral and pasture in character. I believe that good farmers—I mean skillful ones—could raise all the agricultural products in this Territory, and that such products would sustain a million of people.

The timber lands are not now being so largely denuded of timber as they were. They have never been trespassed upon to the same extent as in other Territories. The Indians very often set fire to the timber, but now that they are on reservations the difficulty is somewhat removed. If they were kept there we would not have so many fires. Prospectors are more careful and they seldom set the timber on fire. Settlement here has tended to protect the timber to a great extent. I think it ought to be sold & protected. I would survey and sell it. If the ownership was in individuals it would be better taken care of. There would be great difficulty in protecting this timber & in adopting a system that would protect the land.

Private timber land will protect itself, but the difficulty is to protect the government land. In case alternate sections were sold, the settlers would take the government timber and preserve theirs. I think the timber would be better protected if it was placed in the hands of the register and receiver. This thing of sending foreign timber agents around is very obnoxious to the people here. I think \$2.50 per acre would be little enough for the timber land. There is enough timber here for the supply of the people for a long period.

There is coal in the Territory, but it has not been very much developed yet. There is coal along the Missouri River, and there has been coal discovered here in the mountains.

I think the government had better sell the pasture lands, so as to protect the actual settlers and cattle raisers. I favor the pasturage idea of 3,000 acres to each individual. If this country was divided up into homesteads of 3,000 acres it would sustain an enormous population. The object is to provide for actual settlers. I think the sooner the question is settled the less difficulty there will be between the different interests of the country in the future. If the men had large ranges they could move the sheep and cattle from one part of the range to another, and thus keep the grass always in good condition. If a man owns his property he will take care of it and improve it; but if he is subjected to inroads by other persons he will not do so.

I think if these lands are worth anything they are worth 25 cents per acre. I should rather have the land sold outright than to have this method of living on it, and when they come to prove up they will lie about it and perjure themselves; so I think it would be better for the government and everybody else to sell the land at low rates.

I think the general law of the United States ought to govern in all mining locations. And I think the recording of mining claims ought to be put in the hands of the register and receiver of the district land offices.

Some years there is more rain than others; but probably the average for three years is not much greater than it was formerly. I do not believe in waiting on climatic changes to effect the sale of these lands. Life is too short for that.

The great need of Montana is people.

The theory of the government land system ought to be so it will meet the requirements of the most people.

Agriculture pays for the number of people engaged in it; but farmers cannot sell the surplus they raise, for there is no outlying market at present. There is not enough people. Flour is cheaper here to-day than it is in Ohio.

I think these Indian reservations might be curtailed with safety and the land used for settlers.

The Crow reservation would make an empire as large as all France. About one-third of the Territory is taken up by Indian reservations. The area of the Territory is about 143,000 square miles. The Crow reservation, the Blackfeet reservation, and the Flathead reservation are the best lands in the Territory, and I think they could be curtailed three-fourths and yet the Indians have plenty of ground. They are of no value to the Indians at all. There is no game, and there is much more land than they will ever need to use for agricultural purposes. These Indians have to be fed; these great reservations are great drawbacks to settlements. The Indians will not allow the settlers to drive their cattle, while on the way out of the Territory to a market, across the reservations. In the winter Indians go out of their reservations and kill cattle. They are not kept upon their reservations, although they have a rule that the Indians are not permitted to go off it unless on permission from the Interior Department. Whether the Interior Department gives them permission or not they go.

There has been a great deal of causeless litigation here. There is less now than heretofore, because the United States law applies here now. There are very few mineral districts made in here now.

Sheep and cattle will, to a certain extent, range on the same ground. If the range is short, the cattle go off, while sheep can do better on a short range.

I think it will take less than 30 acres to range one beef. A man can take 10 acres

once and sustain a beef, but oftener I think it will take 20. Five sheep, I think, are about equal to one beef. If sheep and cattle are put on the same range, the sheep will eat the grass off very close, but you move them off on to another range, and in a short time the grass grows up, and the cattle come on where the sheep have left, and you cannot get the cattle away from that range at all. It appears they prefer the grass grown up after the sheep have left to that on any other kind of ground.

I do not think there is that conflict between cattle and sheep owners that people present.

There is really no law here as to the water right. I think there are some laws, but they are all in a chaotic condition. The courts have been deciding this question again and again, until they are all at sea on it. I think it would be better if there was a law of Congress on the subject.

I would sell the timber separate from the mines, in order to save timber; but if a man has bought a mine, I think he should take the timber on his ground for the use of the mine.

Settlers complain that there are no monuments or marks to indicate where the public survey is in three or four years after it is made. There is more land surveyed here than can be sold for years to come. Land has been surveyed where it ought not to have been.

I do not favor any change in the rectangular system. I think it is a good system, provided it is properly carried out. I think there are changes which, if made, would be a remedy to many little evils. I think the surveyor-general's office is a good thing. The forms of the land office could be simplified and condensed, and attorneys in fact could be allowed to do all that the claimant can after he makes his original location. There is another thing. The whole system of acquiring title to the public land needs to be simplified, but with this circumlocution it is almost impossible for a man to get anything.

There is another thing that ought to be done. This classification of the land should be more carefully made. If it is agricultural land and set down as mineral land an applicant is put to heavy expense to prove it is non-mineral in character.

In consideration of the fact that two or three railroads are coming in as rapidly as they can, I think these questions ought to be taken hold of by Congress and settled, as they will materially affect the prosperity of this country.

I think the real wealth of the Territory is stock-raising, and the bunch-grass is worth more than all the mineral of the country. The hills are covered with it to the very tops. When I came here nine or ten years ago they did not raise any wheat; they had to bring it all here. It was not believed that we could raise wheat that would make good bread. We had to pay \$10 for a sack of 90 pounds in those days. We can grow all the cereals and I think can raise all of the fruits and a very fair crop of corn, while we beat the world on potatoes.

The highest altitude of irrigable land is not more than 4,500 feet, but I think it will take a great deal of capital to irrigate these large bodies of land, and I think the government should assist irrigation in every possible way.

There is a tract of 5,000,000 of acres that could be irrigated by aggregating capital or by large companies.

The manner in which placer claims are held here is all wrong. If a man makes a claim for a placer or lode claim he ought to pay for it within a reasonable time. There ought to be some limit. The development of the best mineral portions of this country has been retarded by persons who have made placer claims just for speculative purposes, and by not paying for and working them.

---

*Testimony of Frank P. Sterling, receiver of the land office at Helena, Mont.*

FRANK P. STERLING, receiver of the land office at Helena, Mont., testified as follows:

I have read the statement of Mr. Moe, and, with some exceptions, I concur in it. I do not concur with him in the matter of disposing of lands for pasturage homesteads. I think in certain localities these arid lands should be disposed of at a nominal price for pasturage purposes. I confirm the complaint made of bad work in the matter of locating stakes from my own personal observations. The number of applications that come into the department to amend homestead filings is evidence of the errors committed in the matter of surveys.

We have a great deal of trouble in determining the non-mineral character of lands; and we have a great many such cases which cost the settler a great deal of money—from \$15 to \$25—which, of course, he has to pay. I see no way to determine the non-mineral character of lands except by receiving testimony on that point. It is all guesswork except where testimony is taken.

*Testimony of Rowell H. Mason, surveyor-general of the Territory of Montana.*

ROWELL H. MASON, surveyor-general of the Territory of Montana, resident at Helena, testified, September 24, 1879, as follows:

I have been surveyor-general for two years; I was appointed in October, 1877. I believe thoroughly in the rectangular system. I think it is the one best adapted to the wants of the people and the most economical to the government in every way. I think that the ruling of the department—I do not know whether it is based upon law or not—that all lines of surveys should be discontinued at the point of their intersection with any military reservation, should be modified so as to permit the extension of base and standard and meridian lines through the reservation for the purpose of securing more perfect uniformity in the surveys. I think, too, that the entire country should be surveyed into townships, but perhaps not subdivided. (I may say here that I am giving you the ideas I have suggested in my annual report.)

I believe in the value of topographical knowledge of the lands. This, again, would more than equal the cost of surveying; and in making these surveys the deputy surveyor should return full field-notes. He should describe the land in a township, as far as practicable, and examine and classify it as to whether it is mineral, agricultural, arid, &c. He does not virtually do that now as fully as it should be done. For instance, a deputy in turning in his field-notes specifies the character of the soil as simply first, second, or third rate. Now, that classification should be increased, and it should be defined as to what constitutes the first class, second class, &c. I think the classification can be reached through the deputies in subdividing. The field-notes of the deputies generally are not of such a character that the surveyor-general will be able to judge of what lands should be subdivided. It might possibly be advantageous for two or more lines to be run so as to divide a township into quarters, for if that were done I think the classification could be made quite complete. Where exterior boundaries are run, if at the same time they run east and west and north and south lines through the townships in subdivision, these lines would have been already run.

Question. Do, or do you not, think that triangulation would be valuable in cases where mountains or large areas of useless grounds are involved?—Answer. Yes; I certainly think so, if they were paid for it. The object would be accomplished just as much if it were chained, without the cost of chaining. My idea is to keep up a complete and whole square system of surveys. The worthless tracts might be triangulated as to avoid chaining. I think that the whole country ought to be surveyed in some way or other. These irregularities in the mineral surveys are due to the fact that the surveyor has nothing to tie to.

I think that the rate of compensation for surveys should be increased. I would suggest for section lines \$8, for township lines \$10, and for meridian, standard, and base lines \$12. Meandering lines should be the same as standard lines, for the reason that they are the most difficult lines to run of any. You take meandering along a river and through brush. I have had a great deal of experience with them, during the last two years, in surveys along the Yellowstone. I have personally inspected a large number of these surveys, and I have been with a party when meandering, and have run lines, and I know many cases where there were 30 acres between two section corners, and sometimes as high as 64 acres. Now if the deputy surveyors could get the *locus* of their contracts executed and could work without any delays or hindrances, the present rates would afford them fair compensation for their own labor. But, in the first place their personal risk should be taken into consideration; and they are exposed to constant loss, not only from the weather, but from their stock being stolen by Indians, and from their men leaving them through fear of the Indians. Twelve of my deputies have suffered considerably from these causes. The argument might be made that surveys should not be made in dangerous localities; but in this district, in the first place, they are all dangerous, outside of settlements, and in the second place it is the policy of the government to have these lands settled. The people are on them, and they require the surveys. I do not think there has been a subdivision in the Yellowstone in the last two years in which there is not a settlement.

Q. Have your deputies used the solar instruments?—A. Yes sir.

Q. Do you think anything would be gained by supplying them with aneroid barometers?—A. Yes, I think there would. I think the timber lands surveyed should be sold in tracts of 320 acres, at \$2.50 per acre. I make no distinction between subterranean rights and surface rights. Another point: I think the rule restricting from sale the timber on the non-mineral lands should be abolished. I think the non-mineral timber lands should be surveyed just as much as any other lands. For instance, in a great portion of the timbered section of this Territory there is mineral underneath it, and I think that the timber should go with the mineral lands; and I think that the timber lands should be subdivided and the timber should be sold, irrespective of mineral, for the reason that this timber is near mills and mines, and I believe that it would be purchased by mill and mine owners for their own protection, and to have it near them so that they could get at it.

There are many fires in the timber in this territory, but to my knowledge there were none this year. We have spruce, pine, and fir timber here. I consider this county very well timbered. From information I know there are large bodies of oak on the upper waters of the Tongue River. There is some white and black ash down toward the other end of the territory.

In regard to the pasturage lands, I think they should be surveyed and sold in limited quantities. I do not believe in the theory of the pasturage homestead. I could sell them at not more than 50 cents an acre, and I think they might be sold at 5 cents an acre. It costs 4 cents to survey them. I should think four sections would be enough for one person.

I think the idea of permanent stakes at each corner of every township a very good one. In Judith district, when the survey stakes were put down there the Indians came and dug them up, supposing there was something cached there.

Another point in regard to the inspection of surveys: I think that the surveys should be inspected by the surveyor-general whenever he can, and if not, by some competent person to be appointed by him. The inspecting surveyor should take out a party—as many as he wanted—not only one man but he should have his chainman and flagman, and he should run the lines and examine the corners and see generally whether the work was properly done. At the same time there should be a small appropriation made for that purpose. I don't care how good a deputy surveyor is, his work would be better done, especially that part performed by his assistants, if it is known that a thorough inspection is to be made.

Another point: I think an appropriation should be made to allow the surveyor-general to make preliminary observations of different parts of the district in order to determine the *locus* of the surveys. That would not be as important if this system of surveying township lines, and especially running cross lines throughout the center of townships, was carried out; but unless this is done I think the surveyor-general should have an appropriation as suggested. According to the present system the surveys are located either from the personal knowledge of the surveyor-general, or reports of deputy-surveyors, or in consequence of petitions. The first two are good as far as they go, but there is the danger that deputy surveyors will report in favor of surveys in regions where there is good running, and where there has generally been petitions from persons in the locality. The office has no knowledge as to the necessities of the case, and cannot tell whether that survey should be made or not. There are persons who want a survey made, and you survey a whole township, when there won't be but one section that is fit for cultivation. The difficulty is that the appropriations made for surveys are too small. My appropriation for this year has already been used up in surveying the tracts that are needed, and we have applications for surveys, and we have no money to make them.

I think the compensation allowed the surveyor-general is too small. The appropriation for clerical hire is also too small. During the last fiscal year I performed a great deal of clerical labor in addition to the duty required of me, and I kept an account of the work that was done in the evenings that I cannot pay extra for, and I worked with my clerks for nearly four months during the year in the evenings, and got the work up. I do not object to the present method of having mineral clerks. There is this one thing about that, the mineral clerks should receive pay for only the time they are actually employed on mineral work; and whenever the regular clerks in the office are employed on mineral work they should be paid out of the mineral fund for the days or parts of days they are so employed. While I am frank to say that I have not followed this system, I have paid the mineral clerk for the time he has been employed out of the mineral fund, and the other clerks out of their fund. Sometimes there will be a press of mineral business and I will put all three of the clerks on that work; and then again there will be the public surveys, and I will have all three of them at work on that. I think the rule should be modified or revoked.

The salaries paid the clerks is sufficient, in my judgment, but there is not appropriation enough to allow a sufficient number of clerks. The office work requires more clerks than I am willing to pay, and the reason is that there are a great many hurried surveys and I have not clerks enough to keep the work up as people demand it should be kept up.

Q. Under what local mining laws do you work?—A. There are no local mining laws here: all use the United States laws.

I think there should be an inspection of mineral surveys allowed. Mineral surveys should be inspected in each district for the purpose of accuracy, in order that they might determine the quality of the surveyor's work.

I think it would be a convenience to the public if the surveyor-general had a seal and could furnish a certified copy of documents in his office on request. There is no seal for the surveyors-general of the land offices. I think they should be allowed to charge a compensation for the records they furnished. That money might be turned over to the department. There are a vast number of records in the surveyor-general's office which the district offices do not have, and therefore the people have to get them from the surveyor-general.

I think there should be some responsible representative of the land department here in this district, and I believe that the best way of transacting the public business would be by some responsible head (in the different States and Territories), and I believe this the best way to satisfy the public, especially in mineral cases. If the business is to be referred to Washington there must be delay.

There have been 75 mineral surveys since 1868.

*Testimony of Granville Stuart, Helena, Mont.*

GRANVILLE STUART testified at Helena, Mont., September 26, 1879, as follows:

I think I can safely say that this will ultimately be an agricultural territory. I think that about one-twentieth of the Territory is capable of irrigation—that is, by the streams, and I think that can be largely increased by artesian wells. I think there is no doubt about that. The nature of the underlying rock is such as to enable them to utilize artesian wells. I am satisfied that they would be a success in all the valleys of the Territory. Fully three-fourths of these lands are pasture lands.

Montana is an exception to most Territories in that respect, for the mountains are covered with grass to the very tops, except where the timber is. Mount Powell, very near Deer Lodge, by barometrical observation has been estimated to be 10,224 feet, and the timber grows on it to about 8,500 feet. That seems to be the altitude at which it will grow on the mountains generally. The timber is what we call red fir. It varies in localities in this vicinity. There is a large amount of what we call yellow pine, which grows to about four feet in timber. It is what is known as the long-lived Georgia pine. The red fir makes good building material, most equal to hard wood. It is objectionable for planks, because it splinters in sawing. There has been very little unnecessary depredation on the timber here. There has been a great and enormous destruction by fire. Our Territorial laws are very stringent; the penalty is a heavy fine, and it is a penitentiary offense to let fires begin through carelessness. No one has yet been convicted. In early days there were two causes for fires: one was the Indians traveling through the country, and for the purpose of driving the game they would set fire to the grass; and the other cause was the universal "prospector." The prospector went everywhere and was perfectly reckless. They would sometimes set fires gratuitously, but usually by leaving their camp-fires burning by old logs. The fires are decreasing, because the Indians are confined to reservations, and much less prospecting is going on. It is now confined to the lode claims, and less placer prospecting is going on. I think about one-fourth of the land of Montana is timber. I cannot think of any system by which these lands may be disposed of. I think it would be much better cared for if individuals owned it, but the trouble here comes in, how are you to discriminate. The timber that stands on the lower portions of the mountains, being accessible, is much more valuable than the timber farther back. Most of our timber will necessitate road-building to get it out. It seems as though the price should be in proportion to accessibility. I don't think the timber ought to be cut off, because I think it would affect the climate very much, and it would take many hundreds of years to restore this timber. It may have been eight hundred years in forming. The smaller growth of white pine timber would perhaps grow in a hundred years. It never reaches any large size, but is excellent for fencing, mining purposes, &c. I think the timber question would be better administered if put in the hands of the local register and receiver. My idea would be to have the register and receiver devise some system of protecting it. The present system is very crude, and great injustice is worked upon our citizens by those timber prosecutions here last year (meaning prosecutions instituted under the Interior Department for depredations on public timber) in that they had no opportunity to acquire title to this timber whatever, and it was absolutely necessary that we should use the timber. We could not exist without it. They came and took snap judgment on every one. There was no unnecessary destruction of timber. It was cut for actual use and consumption. We never exported a foot of it. It was strictly for local use. We felt ourselves aggrieved by being taxed under the circumstances. It struck us in this light: we thought it was better for the government to have this timber used to help build up thriving enterprises here in the wilderness than to have it lie idle.

There is no timber culture here yet. There seems to be some difficulty in getting varieties that are not indigenous to flourish here, and in fact indigenous varieties do not seem to succeed very well. It is a question if timber culture will succeed here.

Question. Have you any suggestions to make concerning the pasture lands?—Answer. I have not given the pasture homestead proposition any consideration, and I cannot say much about it without reflection. These lands have been held in common. One hundred and sixty acres are worthless for pasture purposes. I am inclined to think it would be advisable to create a system to allow a man to acquire land in proportion

to the amount of his stock. I think it would be but just and right for a man herding a large band of cattle to be permitted, on the passage of such an act, to take land in excess of a pasture homestead, in proportion to the stock he has there, by purchase or lease. I think 10 cents per acre would be enough for this land.

Q. Have you had any experience in mining?—A. I have had some experience. I think the square location would do away with a great deal of litigation, and would be much better than the present. Under our present system the oldest location takes the whole ledge. It seems to me it would be better to divide it up among a number of people. I think it better that the county recorders should be abolished, so far as the United States lands are concerned, and that the claimant should make his first filing right here in the office of the register and receiver. I see no reason why there should be any difference between mining claims and homestead and pre-emption entries. There is a deplorable license in the description of mining claims in the county recorder's office. I think the system would be very much improved if it were put in the hands of district land officers.

Q. What is the condition of the water rights in Montana?—A. The water rights in this country are in the most chaotic condition. I stated at the last session of the legislature that this was one of the most important questions that would come up, and that some system should be devised to protect the settlers. There is a sort of priority right here; the man who comes and takes up the water first is supposed to have the first right to it, and there is no limit to it. He can take as much as he likes. The committee to whom this matter was referred came back and reported in four days that there was nothing better could be done. In certain localities the water is taken up, but in a great many localities a very little is yet taken up. I think about two-thirds of the water supply is yet common property. I think irrigation will never amount to much here except by companies, and I think the government ought to aid them by giving them grants of land. It is a system that must be incorporated. It is too great an undertaking for individuals. The land will not be worth the money it takes to put the water on it. These great rivers can be taken out by companies and made valuable, thus rendering the land capable of sustaining a large population.

Most of the bench lands are the very best of soil; and in many places the soil is of a very superior quality to the very summits of the mountains. I am satisfied that this will be a fruit country. If sheltered from the north winds, all the hardy variety of fruits will grow here, cherries, apples, and small fruits, such as strawberries, &c. I think this question should be settled at once, before any more land is occupied and the population becomes any greater; or, in other words, before there is more vested rights.

Q. Have you had any mining litigation here?—A. Comparatively little mining litigation has yet been instituted here, but that is probably owing to the wide expanse of our country and the few people yet in it.

Q. Is there much complaint of the rectangular system of surveys?—A. There is much complaint of the rectangular system, on account of the stakes rotting away. I believe it is a good system, but after three or four years it is difficult to find the corners, as the posts have disappeared. The surveys that were made in the prairie region, the stock rubbed the stakes out of the ground, and the mounds washed down and disappeared, so that there was nothing left. I think the corners should be made of stone, and I think there should be monuments of permanent material on every fourth township corner. They should be made of sufficient size to find without difficulty. Triangulation should be used to bridge over mountains and undesirable places. I have no practical knowledge on the subject, but I think it would save much time and labor.

Q. Have there been any climatic changes here?—A. Apparently the climate is changing. It seems to be wetter, and the seasons warmer, but the snowfall is about the same, being the average, and the supply of water has very little decreased, if any. As the greater portion of our rain falls in May and June, the rain comes at a season when it is needed for irrigation. Sometimes towards the close of the season of irrigation the water becomes very scarce, but at the time the crops are growing then is our greatest supply of water, say along the latter part of June and July. We raise all the cereals, without exception. The Jefferson, the Bannock, the Gallatin, the Beaver Head, the Bear, the Dearborn, in fact all the rivers in this country, can be taken out for irrigating purposes.

I do not think the Territory is yet overstocked; not at present within one-quarter of its actual capacity for stock. That is a very moderate estimate.

I think in mineral claims a man should be compelled to pay up sometime, and that he should not be allowed to hold mineral claims without paying up. I think there should be a limit. Three years would seem to me amply sufficient time for a man to acquire title after location. I do not think simply a possessory title ought to continue for any more than that length of time.

There is another thing I would call attention to, and that is in regard to the old placer mining act. That was a great injury to Montana; it sent our population to other gold fields. There was a vast amount, comparatively speaking, of our placer mines that were

patented and could not be worked. They were held for cheaper labor, scientific apparatus, &c. They drove our placer mining people out of the country. There are miles of good placer mines that to-day would support thousands of men by mining them. They are held by monopolies and companies. They were taken up under government patents but were not worked at all—were held for speculative purposes. That law worked a great disadvantage to the people of Montana. Our yield of gold fell off wonderfully. There is at present any number of government patents, very rich placer mines, that will ultimately yield much gold. Every place that was not known to be worth \$3 per day was taken up and held for speculation.

We have other kinds of land here—mining, pasture, and timber land. I think we ought to make laws that would protect these interests. The only changes that should be made should be those that would affect the settlers and the coming population of this country.

There are some places away up on the sides of the mountains where you can grow fruits, but they do not mature until late. In Deer Lodge County, which is also at a high elevation, they have fine gardens. In my opinion the farm land that can be reclaimed is amply sufficient to support a dense population; that is, after the waters have all been utilized and artesian wells dug.

---

*Testimony of Willis Ball, civil engineer, Beatrice, Nebr.*

The questions to which the following answers are given will be found on sheet facing page 1.

BEATRICE, NEBR., September 30, 1879.

*Public Land Commission, Washington, D. C.:*

I will now reply to some of the questions asked in the inclosed circular. I will consider the first ten only.

1. Name and business as shown above.
2. Seven years.
3. I have acquired 160 acres of land in this State under the "soldiers' homestead act."
4. Living here I have had good opportunities to see some of the workings of the United States land office in this place, and I can truly say that in my judgment the present system is excellent if you have good, honest, capable men to do the business.
5. I got my patent in about three months from the time I made final proof. I think this is about the average time. With regard to contested claims, I will say that so far as I know the trials at the local offices are brief, and conducted impartially. The expense depends mostly upon the contestant's lawyer's fees. I have known a man to spend \$150 in a contest, and I have heard of some who have spent \$300. There was a case not long since here in Gage County in which the contestants each spent \$135 besides their time. From the time the contest commenced to the time of final decision from Washington it took about eight months. Where there has been no contest there has been no delay. Of course I need not speak of the time one is required to live upon a claim in order to make final proof. It is better for one who wants to obtain public lands to go to the United States land office himself and do his own business. A homestead of 160 acres costs \$18.
6. Concerning defects of our land laws I will speak of one in particular, and that is the act which relates to "timber culture." If I had money which I wanted to invest in public lands I would, or might, proceed thus: I would go to a dozen men and say "Here, I want to hire you to work for me a little during the next five years. And what I want you to do is to go to the United States land office and each take 160 acres of land under the timber-culture law and I will do the breaking and plant the trees. All I want of you is to be on hand when the time for proving up comes. I will pay you well for your trouble and of course you will sell me your land at once." Now, the above is the way it can be and is done.

In addition to the above I will say that the law under or by which the Indian reservation in the southern part of this county is being disposed of is very defective. Why, I might go down there, pick out a claim, come back to the land office and file on it, and return and cut and sell wood to my heart's content for the next three months. I will suggest no remedy.

7. So far as I know the eastern portion of our State is excellent for agricultural and pastoral purposes. How it is in the western part I know but little from actual observation.

8. I think all the information desired under this head might be obtained from our State geologist.

9. With regard to this I will say that I believe the present system of making surveys of public lands is a bad system. To my certain knowledge the work in many instances

is carelessly done, and in some cases much of the work described in the field-notes of surveys has never been done. For my part I think the better way to do would be to let the government employ competent engineers by the month or year.

10. I know of none.

Yours truly,

WILLIS BALL.

*Testimony of Minor W. Bruce, Knox County, Nebraska.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. Minor W. Bruce, Niobrara, Knox County, Nebraska; correspondent.
2. Nine years in county; twelve years in State.
3. Have acquired 160 acres under pre-emption laws.
4. Am a member of Bruce Colony, the most successful in the State. Have taken great interest in the settlement of the county, and feel pretty well acquainted with the operation of the homestead, timber, and pre-emption laws.
5. From the date of proving up on pre-emption or final proof of homesteads, from six to eighteen months has elapsed before securing patent.
6. The land officers should be obliged to have a reasonable time expire, say, four or six weeks after land that has been relinquished by the person holding it, after it has been returned to the office as canceled, for frequently parties sell their improvements to persons who are not able to secure it before it is taken by some one else. Under the late law, it becomes necessary to give notice through a newspaper of the intention to make proof, and it becomes necessary for such person to go to the place in which the land office is located in person, thus making a considerable expense to the homesteader. This expense, or a portion of it, should be paid by the government.
7. The conformation and physical character of Knox County, Nebraska, is quite rolling and hilly along the Missouri River, but as you go back into the interior it becomes gradually less bluffy, until it settles down to a gently undulating plain, and is principally agricultural.
8. I think the government can fix the general character of the several classes of land by geographical divisions other than by a general rule.
9. No views on this matter.
10. I think the present method of disposing of the public lands cannot be improved, only in a few reforms of the system as suggested above.

AGRICULTURE.

1. In Northern Nebraska the fall of rain is usually abundant in spring, but in summer is liable to drought.
2. All of it can be cultivated without irrigation.
4. An increase of crops can be had by irrigation in the summer.
5. Irrigation never attempted in our part of State.
6. No idea.
7. The Missouri River, Niobrara River, Verdigris, and Bazill.
12. Perhaps one-hundredth part.
13. It is, in my judgment, practicable to establish homesteads on the pasturage lands.
14. In my judgment it is unwise to put any lands in the market for private entry, as it retards the settlement of the country, and, if sold in large tracts, the speculators will ascertain, as they already have in Nebraska, that it is a poor investment, for the actual settlers are taxing the lands to the greatest possible extent for bridge, road, and school purposes.
16. Eight or ten head of cows will support an average family.
17. Perhaps seventy-five.
18. The growth of grass has increased.
19. Cattle raisers in our section do not fence their ranges, and they will flourish in winter on the range.
20. No.
21. Running water, and Missouri River and Elkhorn.
22. Don't know.
23. Don't know.
24. Yea.
25. There are none in our section.
26. Four hundred head of sheep in our county; 3,500 head of cattle.
27. None.
28. No trouble whatever.

## TIMBER.

1. Timber land in our county is confined to the streams entirely.
2. Small, scrubby oak, cottonwood, elm, ash, cedar, box-elder, and ironwood. Oak is regarded as best, and is most all native and of very slow growth.
3. Should dispose of timber in quantities of 40-acre lots to actual settlers, say for from \$4 to \$15 per acre.
4. Would not classify the different kinds of forest lands.
5. When forests are felled in our section a second growth springs up, the cottonwood and box-elder growing to a height of 12 feet and 15 feet in six years.
6. Fires are usually set out by mischievous persons and Indians, are very destructive, usually accompanied by high winds. Our State imposes a heavy penalty for setting fire to the prairie. The Land Office could by a reasonable law provide for the secure protection of the settlements and timber, and a rule established by the Interior Department would be more respectfully regarded than a law of the State.
7. There should be a law for the protection of the timber from raids by persons who cut it for speculative purposes, though I am of the opinion the actual settlers should have access to all the timber belonging to the government for actual use.
8. It has been the custom in this county for actual settlers to cut what timber is necessary for home supply.
9. The timber laws would be more efficiently executed if their administration and general custody were placed in the jurisdiction of the United States land offices.

## LODE CLAIMS.

No knowledge.

## PLACER CLAIMS.

No knowledge.

*Testimony of Uriah Bruner, attorney-at-law, West Point, Nebr.*

The questions to which the following answers are given will be found on sheet facing page 1.

Answers to questions submitted by the Public Land Commission.

1. Uriah Bruner, attorney-at-law.
2. Twenty-three years.
3. Yes, 160 acres unoffered land under pre-emption act September 4, 1841.
4. Have been receiver for about six years. Land office West Point, Nebr., and Norfolk.
5. On uncontested entries. Homesteads, including witnesses and their expenses about \$40 average. Some few made their entries say for \$25, while others living at a great distance from office their expenses have run up to \$75. Timber claims, including proof, exclusive of the improvements that have to be made on the land, would be about the same as in homesteads. Fees in pre-emption entries are considerably less. Since I am out of the office I understand that the applicant to homestead and timber claims are required to give thirty days' notice by publication of his intention to make final proof. This is a useless and burdensome expense, which should be done away with. No one but the proprietor of the newspaper will be benefited by such notice. Contested claims are frequently very expensive to the contesting parties. The average expense of a contest is perhaps \$40. Where no attorneys are employed and personal notice given the expense is sometimes reduced to about \$15, but more frequently it will cost \$100.
6. The timber law as it stands has several defects, in my opinion. It requires that 2,700 trees should be planted to each acre, and 675 shall be growing and be thrifty at the time of proving up (five and six years after same are set out). There should be more trees be required to be planted than there are required to be living and in thrifty condition at end of eight years. No trees that are fit for first planting will do well if be planted so close together. They will choke out one another, and while the thriftest and most vigorous will survive, it will yet be injured by those that have been killed out by the choking process. Trees in forest grow straight with long bodies, but they are much retarded in their growth by being overcrowded. It is far better to plant the proper distance so they will not interfere with the growth of each other by overcrowding until they attain a sufficient size for purposes of poles and fire-wood, when the thinning out process can be done by the farmer with profit to the forest as well as to himself. I have considerable experience in raising forest trees in planted groves, and my views I give here are from actual observation and practical experience. I believe that the claimant under the timber law should be required to plant 40 acres for every 160, and the number of trees

quired to be planted to the acre should be about 640, and the number at time of proving up to be about 500; that all homesteaders and pre-emptors on prairie lands should be required to plant and have in growing and thrifty condition 10 acres for every 160—five years after the entry of the same and before the proving of said entries for patenting. In homesteads the proof to be made at the time of final proof and in pre-emptions the proof to be made five years after the date of settlement. There are now acres of land in Western Nebraska and Kansas that are worthless for all purposes except for grazing. These, under proper restrictions, could be sold on condition that part of the same be planted in forest trees. Here care should be taken that the same be not sold in too large bodies to one person or company of persons. Rather have the government inaugurate a system of leasing (as they used to have in Australia) at public auction for a term not to exceed five years at a time. Great care will have to be used or large cattle raisers will soon have a monopoly of all desirable grazing lands. In this land district (Norfolk) the lands are what is called *prairie*, with very little timber here and there on the edges of the water-courses and running streams. Most of the lands are good, rich, farming, agricultural lands. There are yet large bodies of bad, sandy lands, nearly worthless at present except for grazing purposes.

9. I consider the present system well adapted to this part of the public domain.

10. Answered under 6.

## AGRICULTURE.

1. We have sufficient rainfall in this part of Nebraska; snowfall variable. So are the winters—about two-thirds of which are very fine, and one-third extremely cold and boisterous.
2. No irrigation needed or in use here. Most rain between 10th May to 1st July; different seasons variable.
3. All except the sand streaks, which should be planted in timber to get vegetable soil mixed in with the sand.
4. None.
5. None.
6. Crops are raised everywhere in Eastern Nebraska; have no experience in irrigation.
12. The sandy lands above referred to.
13. I think that homestead, timber law, and pre-emption law should be left in force even in pasturage lands until it is definitely determined that no homes will be made or farms opened any more. Cattle monopolists will undoubtedly clamor for an abrogation of the land laws on the plains; but we should proceed very cautiously in this direction. We should remember that this is the day for aggression by large monopolists of all kinds. Our government was established not with a view for enriching a few at the expense of the many, but rather for the purpose of affording opportunities to the toiling millions to rise with the dignity of labor to a comfortable competence for himself and his family. It is the government's duty to see to it that all shall be brought up well, be educated in the rudiments of a good common-school education, and that this fringing up may be done by the *pater familias* without materially cramping himself, the question of social science is undoubtedly the most important that can engage the attention of statesmen, and the land question entering so largely into this question is perhaps the most difficult to solve; to move with great caution must be our motto.
14. Wild grasses decrease by pasturage; prairie fires also injure grass lands.
19. No. Except where the settlements are dense and the land is all occupied. No.
20. No.
21. Wells and creeks; running water principally.

## TIMBER.

1. But little, only fringing on running streams.
  2. Mostly cottonwood, some box-elder, soft maple, ash, black walnut, and white willow. Cotton is preferred for its early maturity, white willow next, box-elder, soft maple, and ash. Time of growth, from May to September.
- Very respectfully, &c.,

URIAH BRUNER.

*Testimony of Royal Buck, Red Willow, Red Willow County, Nebraska.*

Answers to questions submitted by the Public Land Commission.

RED WILLOW, NEBR., December 8, 1879.

1. My name is Royal Buck; residence, Red Willow, Red Willow County, Nebraska, and my occupation is a farmer.
2. I have lived here nearly eight years.

3. I have a homestead under act 1862, and a timber claim under act to promote growth of timber, &c.

4. I have served as register of United States land office at Nebraska City from 1861 to 1865, and during the past two years have spent much time in looking out claims and locating immigrants.

5. The expense of procuring title under homestead has been about \$30 uncontested, and from \$50 to \$75 where contested.

6. Yes; first homestead law. The present law permits parties to make entry at the local land office without swearing that he is an actual resident of the tract or that he has made any *bona-fide* improvement on the same, but when the homesteader goes before the county clerk of the county where the land is situated he must swear that "he is a resident (or that some member of his family is residing) on the land he applies to enter, and has made *bona-fide* improvement on the same." This seems to be an unjust discrimination; it is also absurd. Suppose a man comes to Western Nebraska from Illinois to look up a homestead. His family is left at their old home; he comes by rail, stage, &c., finds his land, establishes its boundaries, and then, without any conveniences at hand, he must establish a *residence*. The truth is, he can't do it, but in order to secure it he throws up a few sods, calls it a residence, and makes the affidavit required under a mental protest and reservation—practically swearing falsely. My suggestion is this, that every man who enters a homestead be required to swear that he has performed some personal act on the land by which he proposes to initiate title, and that he has also made commencement of residence on the same. Another suggestion is that where great distance or bodily infirmity prevent personal attendance at district land offices applications may be made in the county where the land is situated, before any officer authorized to administer oaths, having a seal, same as timber-claim entries. Now homestead applications and affidavits can only be made in the counties before the county clerk. County judges and notaries are ruled out, and clerks monopolize the business, much to the inconvenience of settlers. 2d. As to timber-culture entries, I have thought if they were confined to actual residents of the counties where the lands are located it were better. Too many trees are required to be planted. The first law placed the trees too far apart; the present law is on the other extreme—give us the half way.

7. Bottom lands along streams with some timber; soil rich sand loam, beautiful "divides" or uplands well adapted to both agricultural and pastoral.

8, 9, and 10. Have no suggestions. Present laws seem well adapted to promote actual settlement.

#### AGRICULTURE.

1. Climate is good; rainfall is increasing; usually have from 5 to 12 inches of snow in winter, but it disappears soon after falling.

2. Heaviest rains usually occur in April and July; most seasons then are sufficient for all practical purposes of farming. When drouths occur they are usually in June and August.

3, 4, 5, 6, 7, 8, 9, 10, and 11. Have no experience in irrigation. We have some streams which might be utilized for irrigation.

12. Not more than one-twentieth part.

13. Homesteads of a thousand acres might be selected in some localities which would be suited for stock ranges only, but these should be confined to cañons and bluff lands when ordinary farms cannot be made.

14. Most decidedly no.

15. About 5 acres. This is called a first-class stock country.

16. About 50 head.

17. Can't state.

18. Buffalo grass decreasing. Blue stem and other large grasses increasing.

19. No fences; cattle can't well be confined in winter on ranges by fences.

20. No.

21. Red Willow Creek, Republican River, and several smaller streams.

22. Ten sheep.

23. Decrease.

24. Not well.

25. Know of no conflicts.

26. Sheep from 100 to 500 head, and about same of cattle.

27. No suggestions.

28. Yes, very much. The surveys in the eastern half of the county have been done badly, very badly. Many townships have no evidence that any government survey has ever been made. The truth is, great fraud has been perpetrated in the government surveys, and as a result those who settle on these lands are obliged to have them surveyed. A resurvey ought to be made by the government, and the contractors who made the first survey ought to be prosecuted on their bonds and oaths on returns.

## TIMBER.

1. Only small belts of timber along the streams. The varieties are cottonwood, box-elder, ash, elm, and hackberry.

2. The kinds of timber usually planted are cottonwood, box-elder, and ash, and cottonwood is considered the surest growth and quickest to mature. Ten years of growth give fine groves.

3. Timber lands in this county are all under claim by homesteaders and pre-emptors. Have no suggestions to submit. Have no suggestions on remaining questions under this head.

The other topics in circular not relevant to this locality, and no suggestions are submitted.

In closing these suggestions I desire to recur again to the subject of the public surveys. Some relief ought to be afforded the settlers in many portions of the western part of the State. It is an immense burden upon new settlers to be obliged to hire a surveyor to run out their claims before they dare build a house, and when so surveyed there is no certainty of correctness. There ought to be a resurvey of all the land west of range 25 west of sixth principal meridian and south of the Platte River.

Respectfully submitted,

ROYAL BUCK.

*Testimony of Lewis H. Kent, lawyer and land agent, Orleans, Nebr.*

The questions to which the following answers are given, will be found on sheet facing page 1.

1. Lewis H. Kent, Orleans, Nebr.; lawyer and land agent.
2. One and a half years in county and four years in State.
3. I have not.
4. By being in the land business.
5. About \$50 for uncontested and \$75 for contested.
6. Would allow the local register to put on entries, upon a relinquishment being made at the local land office.
7. Agricultural and pastoral.
8. Geographical division.

## AGRICULTURE.

1. Climate good; long summer.
2. In the spring. Yes.
3. Nearly all of it.
4. None.
10. Water has been all taken up under homestead and declaratory statement laws, only under contests of the land.
12. About one-third.
13. Yes.
14. Yes, and the quantity should be limited.
15. About two acres per head.
16. About ten.
18. The growth of buffalo grass has diminished and blue-joint grass increased.
19. They do not fence. Yes, I think they can.
20. Yes.
21. Plenty.
22. About seven.
23. Diminished.
24. No.
25. The sheep raisers drive the cattle owners out.
26. About 5,000 head of cattle and 2,000 sheep.
27. Yes, great trouble.

## TIMBER.

1. About one-twentieth of the land. Cottonwood timber mostly.
2. Cottonwood and maple.
3. Would sell it in small tracts of about 10 acres.
4. No; only as above.
5. Yes. There is a second growth.
6. Very great.
7. Considerable timber is cut for fuel by homesteaders
9. Yes, much more so.

*Testimony of R. A. Kenyon, farmer, Hooker, Gage County, Nebraska.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. R. A. Kenyon ; farmer; Hooker, Gage County, Nebraska.
2. Ten years in county and twelve in State.
3. I have, under pre-emption and homestead laws.
4. In seeing lands sold to speculators.
5. In my case I complied with the law and got my title within six months after proving up; others have not gotten theirs under two years.
6. The selling lands in larger tracts than 160 acres has worked detrimental to the part of the country.
7. This county is pastoral, with plenty of good water for stock.
9. The present system of survey is the best that could be had for this section of the country.
10. The only and best way, in my view, is the present method, in giving the lands to actual settlers in whole.

AGRICULTURE.

1. The climate has changed since I have been here; we have one-half more rain yearly than we did six years ago, but this has been a dry season; snowfall is light.
2. June and July in heavy quantities. Yes.
3. All.
4. None.
5. None.
13. Yes; one section.
14. Yes, it should. If it is not moneyed men will get it all, and make the rich richer and the poor poorer.
15. One acre. The best I have ever seen from Minnesota to Louisiana and from Nebraska to Vermont.
16. Twenty-five.
17. Not more than four.
18. Increased.
19. None. They can.
20. They would.
21. Springs generally.
22. Ten.
23. If not overpastured it has held its own.
24. Yes.
25. I know of none.
26. About equal. Cattle average 100 head, sheep 400.
27. None.
28. None.

TIMBER.

1. About one-half all young timber and spreading timber is being put out every year. The timber is on the streams.
2. Cottonwood, soft maple, walnut, and ash. I regard all essential. Cottonwood and maple have the quickest growth.
3. In such locations as mine in ten-acre lots by lease, for the reason that it would give the timber to those that most need it.
4. I would.
5. There is a second growth, and generally faster than first.
7. Lease, in small quantities.

---

*Testimony of H. W. Parker, register, and R. B. Harrington, receiver, Beatrice, Nebr.*

BEATRICE, NEBR., November 3, 1879.

*Public Land Commissioner, Washington, D. C.:*

SIR: In compliance with your request we give you our "views of the present land laws and the administration thereof."

1. The pre-emption act of 1841 should be repealed. The only use made of it, as far as our observation goes, is to prolong the time of keeping the land from taxation. A party will file on unoffered land and hold it thirty-three months, and then commence

his filing to a homestead entry and hold it for seven years longer before perfecting his title. A homestead claimant can commute his claim to a cash entry after six months' residence, and that is as soon as a pre-emption claimant can get title.

2. The act of March 3, 1879, requiring homestead and pre-emption claimants to advertise thirty days before proving up, should be repealed. In our opinion it is a useless act, doing no one any good except the printer, but causing the claimant useless expense and trouble.

3. The homestead law should be so amended that when a homestead or timber culture claimant relinquishes his entry in writing, the land shall be open to entry without further action by the General Land Office, the local officers making report at the end of each month the cancellations made during the month, and transmitting to General Land Office the written relinquishments.

4. The act of March 3, 1879, "granting additional rights to homestead settlers," should be amended. It discriminates against the soldier. A soldier who has taken less than 160 acres cannot make an entry under this act, while a citizen who has made an entry of 80 acres, paying \$9 for the entry, can make an additional entry of 80 acres without paying anything, thus giving him 160 acres for \$9, and the soldier who took 160 adjoining him had to pay \$18. The citizen should at least pay as much for his 160 acres as the soldier has to pay. If any difference is made it should be in favor of the soldier. All acts for the disposal of the public lands, except this act, allow the register and receiver a commission on the sale or disposal of the land according to price of same. Why should they be required to do the work under this act for nothing? If the government wants to give the land away, all right, but it should provide for paying its agents for doing the work necessary. S. No. 490, providing that the fees allowed registers and receivers for testimony, &c., shall not be considered or taken into account in determining the maximum of compensation of said officers, should become a law, or else H. R. 5493, to authorize the Secretary of the Interior to make allowance for rent of United States land offices, should become a law, and the fees heretofore accounted for by the recorder and receiver for taking testimony, and covered into the Treasury of the United States, should be returned to them, or the rent paid by them refunded. Rent of offices and fuel should be paid by the government, or allow the recorder and receiver the rents for taking testimony, making abstracts, &c.

5. The timber-culture act should remain as it is. In our opinion it cannot be improved by amendment.

6. The grazing lands in the western portion of this State, which are unfit for grain raising, and only fit for grazing, should be offered for sale, and all not sold at time of offering should afterward be subject to private entry.

7. The system of public land surveys should be changed. It seems impossible to get a good job done under the present system.

Respectfully,

H. W. PARKER,  
*Register.*  
R. B. HARRINGTON,  
*Receiver.*

#### *Testimony of Moses Stocking, farmer, Wahoo, Saunders County, Nebraska.*

The questions to which the following answers are given will be found on sheet facing page 1.

*To the Public Land Commission, Washington, D. C.:*

SIRS: A press of work, compelling much absence from my home since the receipt of your circular, is the cause of delay in attending to its many points, points requiring extensive and varied knowledge to enable one to approximate a satisfactory answer. But to the "questions."

1. My name is Moses Stocking; residence, Wahoo, county of Saunders, Nebraska; occupation, farming and stock raising.

2. Have lived in this county fourteen years, and in the State twenty-three years, and have had some acquaintance with the country since May, 1853.

3. Yes; secured a pre-emption right in Cass County in 1857, and a homestead in this county in 1872, and under the laws then in force.

4. That of my neighbors who have acquired lands near me.

5. Under the pre-emption laws the time has varied from one month to twelve months in non-contested cases. In contested cases the time is often much greater, occasionally running into the second or third year, and sometimes attended with much expense to the parties. The decision of homestead contests are equally dilatory. A case is now pending in Butler County—that of Albert Long for the west one-half of east one-half section 20, township 15, range 4, sixth principal meridian—which has been pending about eighteen months. Parties have made several trips to Lincoln, fifty miles dis-

tant, with witnesses. No notice of a decision had reached Long on the 10th instant. He still remains upon the land, which is about two-thirds improved; is justly entitled to it; is very poor and unable to litigate. The case is a hard one.

6. The land laws as they now stand, so far as I understand them, are far more perfect in the spirit and letter than is the practice of the officers who are intrusted with their administration. Land attorneys are a nuisance to the honest poor man, and should never be allowed inside a government land office. All that is required is capable and honest land officers.

7. There is no longer any government land in this county; all sold, as is a large portion of the railroad and school lands. The topography varies from level alluvial bottom to high rolling land, a portion being smooth table and another portion smooth rolling land. All is agricultural timber, very limited. The topography of the State, with the exception of some sand-hills, is quite similar to that of this county. The entire State originally comprised one grand pasture-field. Twenty-six years ago probably not more than one-half of the area, and that in the eastern part, was agricultural. To-day about seven-tenths is fairly such, due to increased moisture. The balance is still only pastoral, and of these three-tenths the next quarter century will no doubt have redeemed all, excepting perhaps the higher table lands in the west end of the State.

8. Cannot find the act referred to. The character of Nebraska lands already is pretty well determined, being nearly all sufficiently fertile for agricultural purposes, moisture alone being needed west of North Platte, and even there the bottom lands should now be classed as agricultural. The practical "rain belt" has moved westward about 100 miles during the last twenty years.

#### AGRICULTURAL.

1. The climate of Nebraska is mild for the latitude, and subject to sudden changes, but salubrious and healthy. Mean annual temperature for a series of eight years, according to two records,  $47.57^{\circ}$ ; average snow and rainfall for same time, three records, 32.95 inches; coldest days, January 7, 1864, and February 15, 1866,  $32^{\circ}$ ; rainfall of winter months, 3.71 inches; of March, October, and November, 4.9 inches; other months, 20.86 inches.

2. Rainfall, as shown in preceding answers, occurs mainly during the crop months and is all-sufficient—the last three seasons too much.

3. Ninety-nine per cent.

12. About 10 per cent. is better adapted to pasturage than to plowing, owing to roughness.

13. Yes; second limit to 640 acres, or even less.

14. No. For then the land would be taken by capitalists in large tracts for stock purposes, and thus keep settlers out. What the country wants is homesteaders and families. The country is desirable and sure to settle in time if held free for families. Allow the stockmen to use it until wanted by actual settlers, but never allow them to gobble the fee of the soil.

15. About three acres, but were the soiling system practiced two acres would do it better, and make four times the manure.

This section compares favorably with others.

16. There should be at least one bovine to each person in a family or nation. Nebraska has about one-twelfth less cattle than people.

17. Fifteen and sixty-seven hundredths to the square mile.

18. Increased—fully doubled in twenty years.

19. No. Only use a corral. It would not be safe to confine cattle in winter unless water, grass, and shelter were abundant within the inclosure.

20. Think so, as thin scrubs and low-grade bulls would be castrated, and encourage the using of good blood as breeders and sires.

21. Springs, creeks, rivers, and wells.

22. About ten of merino and six of cotswold.

23. Increased where not overstocked.

24. Yes; but it is not quite safe for the sheep.

26. Four thousand one hundred and twenty-five sheep, and 11,850 cattle. Sheep are mostly herded in flocks of 500 to 700, and cattle in herds of 50 to 150 head. Cows are frequently lariatied near the dwelling-house.

27. I would encourage the completion of both the North Pacific and the South Pacific Railroads by moderate and reasonable land grants, and would limit the prices at which the lands should be sold by the companies. Had previous grants been thus limited all would have been well. Corporations should not be allowed to charge the settler a higher price than the government charges him for lands of similar quality and location. The completion at an early day of those roads has become a necessity to the country. They are needed to facilitate communication between distant parts of our broad land, and to promote the settlement thereof; and to move the crops.

which must soon be grown thereon. And again, they are greatly needed to facilitate the movement of troops, stores, and ordnance for the protection of the frontier settler against Indian raids, and to forever stop Indian wars. The Indian policy of our government is the most stupendous folly on earth—a farce which out-Herods the devil's glee at the sufferings of Christ upon the cross—a fraud of the first magnitude upon both races. Ask that policy where is Meeker? Where is the widow Decker's daughter and her little babe? Where the lady whose scalp with jetty flowing hair attached was found in the Sand Creek camp at the close of Colonel Chivington's fight? Where the victims of the Custer "holocaust?" Where is General Canby; and where, oh where, are the hecatombs of Minnesota's slain?

28. For an arable country like Nebraska, no better system of surveying than the present rectangular one can be devised. But the work should be well done, which was not the case in this county. Excepting upon township and range lines there probably is not one section which has straight sides. Corners are from several feet to as many rods out of line. This cause coupled with the fact that the Pawnees pulled up and burned stakes, that the wild animals and the elements combined to tear and obliterate the mounds, renders it difficult often to find corners.

#### TIMBER.

1. Under the Indian *régime* owing to the devastating annual fires, nearly all timber was confined to the moist margins of streams, to the breaks and cañons of the river bluffs, where fires could not penetrate, and was usually of a short and scrubby character. Civilization has changed all this, and now trees grow most luxuriantly wherever planted and cared for. Originally about 2 per cent. of the area of this county might have been classed as timbered. The varieties were three kinds of oak, two of elm, two of hickory, black walnut, green ash, hackberry, lind, red and box maple, ironwood, boxwood, mulberry, white and yellow cottonwood, black cherry, and many varieties of shrubs.

2. Cottonwood, box and red maple, green ash, black walnut, black and honey locust, sugar maple, white walnut, chestnut, burr and white oak. Of evergreens, arbor vitæ red cedar, pines, firs, spruces, and larch. For ease of planting, rapidity of growth, and durability, the black locust would bear the palm were it not for the borer. Black walnut and green ash promise to be the most useful for mechanical purposes, and are fast growers. Box-maple is esteemed for shade, for wind-breaks, fuel, and sugar.

3. By sale in small parcels or lots to actual settlers. Gauge the size of the lots by the quantity of timber thereon, and grade the price by the quantity and character of the timber, and limit the purchase to one tract or lot. Five acres of good timber is enough for one family. If the timber is poor and sparse enlarge the area under a lease, the timber will be removed and land abandoned. Under private ownership the timber will be closely watched and guarded. Sell to actual settlers only, and on their oath as to settlement, thus barring all speculators.

4. Yes; classify and grade tracts as to price and quality as above stated.

5. Forests are not wholly felled here. The dead trees and those useful in the arts are taken out, affording more room and sunshine for the undergrowth, causing young trees to grow with increased vigor, but the varieties continue about the same. Soon there is an evident improvement in the character of the young trees—they becoming rapidly taller, and losing the shrubby appearance of the older growth.

6. Prairie or forest fires usually have their origin in sheer carelessness or in criminal wantonness on the part of settlers, hunters, and emigrants, the last being curious to see a big fire. In extent these fires often sweep over hundreds of square miles of country and are very destructive in their effects, not only to personal property among the settlements but to all forest growth, and occasionally to life; kill the grasses and damage the soil; increase the bleakness of the climate; destroy the insectivorous birds so useful to the agriculturist, and deprive the earth of its natural and much-needed winter covering, and all without one redeeming benefit. The prevention of such fires is a difficult task. The ordinary fire-guard is of little use in a strong wind. Ordinary roads and creeks are easily jumped. A system of fire-guards of sufficient breadth to insure safety would be a heavy burden upon the people. Owing to the difficulty of proving offenses, punishment by fine seems to have but little effect. Imprisonment no doubt would prove more effective. Let a portion of each fine revert to the informer or prosecuting witness, and it would do much toward detecting offenses. A too stringent law, bordering upon severity, would be non-effective, as the people would not execute it.

7. During the building of the Overland Telegraph Line and the Union Pacific Railroad a wholesale slaughter of public timber along the line of the Platte River was carried on. The best grove in this county, opposite the town of Fremont, was then destroyed, tree trunks being used for ties and the tops left to rot. This county then had no settlers to prevent it. Where timber was cut upon the north side of the Platte usually there was not such waste, for the tree-tops were cut into cord-wood and sold to the company to run their engines. The use of the public timber for mineral, building,

agricultural, and road purposes, or bridging, is indispensable to the carrying on of these branches of business. Therefore the sooner the government puts the timbered land upon the market in small parcels, and limited, the less of the timber will be plundered. The average citizen would much rather buy at a fair price than to steal.

8. The party who fells a tree I believe usually claims ownership. But his neighbor thinks it a small crime to steal from a thief.

9. As they have the selling of all lands, their facilities for knowing the character of the land in their respective districts, and for obtaining information in regard to depredations are good, therefore they should be efficient detectives and ready prosecutors. But efficiency in this class of duties will require a very different class of men from those who sometimes get into land offices.

The foregoing has been very hastily written, and, being compelled to leave in the morning upon a business trip of several days, have no time to extend remarks or revise the matter thereof.

Respectfully submitted.

---

*Testimony of E. F. Test, claim agent Union Pacific Railroad, Omaha, Nebr.*

FREIGHT AUDITOR'S OFFICE,  
Omaha, Nebr., November 25, 1873

1. E. F. Test, Omaha, Nebr., claim agent Union Pacific Railroad.

2. Since 1868.

6. Yes. They should be distributed in larger quantities, and proof of settlement made the basis of ownership. A case in point is the Pawnee reservation, now Nance County, in this State, and the Society of the Boston Aid to Land Ownership. The wealth of the society represented \$15,000,000. The society wanted to buy it in the interest of the workingmen, making proof of settlement the basis of ownership, starting towns, farms, and advancing the means to cultivate and improve the land. The present law prevented, and the reservation is still largely unsettled. One of the land grant railroads has been pursuing this policy through other parties in Boone and Greeley Counties, and the said counties, one of them at least (Boone) has more than doubled its population in two years.

27. Encourage our churches and charitable institutions to quit pauperizing our poor people in the large cities and elsewhere by doling out food and clothing to able-bodied men and women, and urge them to move out on the public lands. Sufficiently large tracts might be set aside for such purposes and the churches and charitable institutions have their superintendents in charge to locate the poor people on the homes of their own, advancing the means necessary to start them, payable at stated times, and forfeiture to be the penalty for abandonment of their claims. In other words, let the government furnish the land, proof of settlement being the right to ownership, and the churches and the institutions of charity the money to settle and improve them, and give the poor people of our large cities, and elsewhere, the chance to build up homes for themselves and their children. It cannot be disputed that every new institution of charity brings in an increased list of paupers. Pauperism to crime is a natural step, and then government is compelled to support many of these people in our prisons. It is cheaper to make them good citizens and producers. The churches have had much to do with this pauperization in the past through mistaken efforts at charity. Colonel Robert Ingersoll says: "It has reduced Italy to a hand-organ." Will it do so for the United States? This idea I do not consider impracticable. It has been agitated by myself and others in this State for a number of years. The Roman Catholic Church has already adopted it and is meeting with success. The Methodist Episcopal Church might also adopt it to advantage, as they raised \$5,500,000 for educational and missionary purposes in the centenary of its existence. Was it better than giving homes to our poor people?

I respectfully offer these suggestions to the honorable Commission for what they are worth.

E. F. TEST

---

*Testimony of C. H. Walker, real-estate agent, Bloomington, Nebr.*

Referring to the circular inclosed to me from the Department of the Interior, I have to say:

1. My name is C. H. Walker. My residence is Bloomington, Nebr. I am now engaged in real estate. I was register of this land office from 1872 to 1875.

2. I have lived in this State since 1862.

3. I have acquired a quarter section of land under the homestead, also 12 quarters with agricultural scrip.

4. As register of the United States land office I had a pretty good opportunity to learn the practical workings of the public-land laws.

5. An intelligent answer to your fifth question involves so many contingencies it is very difficult to answer it intelligently. Sometimes returns come back from the department in reasonable time, but in other instances they drag. In contested cases much depends upon the attorneys or the complications that surround the case.

6. In the timber-culture act, the State horticultural society of this State asked Congress, by resolution at their meeting of 1878, to set apart one-fourth of every section for the cultivation of timber of those lands that are naturally devoid of timber. This recommendation was made by a class of men that give these matters much thought, and who have watched the operations of the law. This country needs more timber, and if one quarter of each section was withdrawn for all other purposes, in the end there would be a forest on every section. Again, I believe it would be to the advantage of every man taking a homestead if he was required to plant and cultivate a certain amount of timber, if the homestead was devoid of timber. The country wants more timber to assist in modifying the climate of the prairies, and there has been much talk and many plans proposed whereby its growth would be encouraged. I believe, and I also express the conviction of many that I have talked with, that the government should require more in this direction.

7. In answer to question 7, an experience on the frontier for sixteen years has taught me that the country is undergoing a radical change in climate, and that what a few years ago—I mean seven or eight years ago—were classed as pastoral lands are now regarded as the best agricultural lands. By referring to the maps of the Union Pacific Railroad of 1870 to 1872, it will be observed that the entire Republican Valley in Nebraska was classed by them as pastoral lands, and yet within the last four years this county (Franklin) has taken the champion prize at the State fair of Nebraska offered for the largest and finest display of farm products in the State. My own opinion is that if let alone this question will settle itself, and that by experience is the only way it can be settled. I believe in a very short time it will all be agricultural lands, and that it should be held as such; that it would be a great calamity to the country if there was any change in the manner of disposing of the public lands, so as to build up a landed cattle aristocracy. Let the matter settle itself.

In answer, severally, to your questions 8, 9, and 10, I do not see how the public can be much better protected nor how the homeless can receive greater encouragement than under the present law. I can see how it would be to the advantage of men of great capital to be allowed to purchase large tracts to be held for their own purposes of grazing. They have the use of it now, and when disposed of it should be for the good of a greater number. As before stated, the present system of disposing of the public lands is good enough, and I do not see how it can be bettered by a radical change. I speak only for Nebraska.

C. H. WALKER.

---

*Testimony of W. H. Beatty, chief-justice of Nevada, Carson City, Nev.*

CARSON, NEV., November 21, 1879.

GENTLEMEN: Having received a copy of your circular requesting information in regard to the subjects to be reported upon by you, I would state that I have had no experience and but limited means of observing the practical workings of any portion of the public-land laws except those which relate to the location of mining claims, and more especially lode claims. I would therefore confine myself to the questions under that subhead:

First. In regard to my experience of mining and mining litigation, I have been a resident of Nevada for nearly seventeen and of the Pacific coast twenty-seven years, during most of which time I have been more or less conversant with the operation of miners' rules and customs. From 1864 to 1875 I was judge of the districts embracing Lander and White Pine Counties. Each of those counties contained numerous mining districts, with varying rules and customs, and in each a great number of mining cases were litigated during my term of office. I also presided, by special appointment or invitation, at the trial of several of the most important mining cases in Eureka and Pioche, and have thus had occasion to decide over and over again most of the questions connected with the location of lode claims. I have also heard the testimony of great numbers of practical miners of every grade of intelligence, and of many of the most noted professional experts and scientific theorists, as to the formation and characteristics of veins and other mineral deposits where the matter at issue was a question of identity or continuity of veins or lodes. In hearing applica-

tions for injunctions and in trying causes which were submitted for decision by the court without the intervention of a jury, I have frequently been called upon to make minute examinations, in company with experts, of the surface and underground developments upon every variety of mineral deposits and in all sorts of rock formations that are found in Eastern Nevada. Since January, 1875, as a member of the supreme court of Nevada, I have had occasion to review several cases involving a construction of the act of Congress of May 10, 1872, and to consider particularly the effect of that provision of the law (Revised Statutes, section 2324) which accords to the miners of the respective districts permission to make local regulations governing the location, &c., of claims.

Second. In regard to the defects of the law. The principal, the vital defect in the existing law is this permission to make local rules. There are, I have reason to believe, other important defects in the law, but as to most of these there are more competent judges, and I leave it to them to point out the evil and suggest a remedy. But as to the practical workings of the local rules and customs of miners, when allowed the force of law, I have very decided opinions, which I feel that my means of knowledge justify me in stating with some confidence in their correctness. I believe that the whole subject of mining locations is an extremely simple one, which may easily, and certainly therefore ought to, be regulated by one general law, the terms and existence of which shall be established by public and authentic records, and not left to be proved in every case by the oral testimony of witnesses, or by writings contained in loose papers or memorandum-books, such as are often dignified by the name of "mining records." I am convinced, moreover, that the tainting of every mining title in the land at its very inception with the uncertainty which results from the actual or possible existence of rules affecting its validity, perfectly authentic evidence of which is nowhere to be found, is a stupendous evil. Experience has demonstrated that such an uncertain state of the law is a prolific source of litigation, and no experience is required to convince any man of ordinary intelligence that it must have the effect of depreciating the value of all unpatented claims by deterring the more prudent class of capitalists from investing in them. That the subject is simple enough to be embraced in one general law is proved by the fact that the laws of the various districts, although differing in details, are in substance identical, and are substantially contained in the existing acts of Congress.

When placer-mining began in California there was no law regulating the size of claim or the manner of holding and working them, and local regulations by the miners themselves became a necessity. They were adopted, not because the subject was too complicated or difficult for general regulation, but because they were needed at once as the sole refuge from anarchy. The first and most important matter to be regulated was the size of claims, and the earliest miners' rules contained little else than a limitation of the maximum amount of mining ground that one miner might hold. That being determined, he was left to take possession of his claim and work it as he pleased. It thus appears that the location of a mining claim was nothing more nor less than the taking into actual possession a limited quantity of mining ground, and this was accomplished by simply marking its boundaries and going to work inside of them. But in taking possession of their claims miners sometimes failed to mark their boundaries as distinct or to do as much work on them as later comers, desirous of securing claims for themselves, thought essential to an actual possession. Hence arose disputes and violent conflicts. The next and the final step in the development of miners' law accordingly was the regulation of the mode of marking the boundaries or otherwise designating the locality and extent of claims and the *quantum* of work that must be done to hold them. As a fence around the claim was utterly useless, four stakes at the corners or two stakes at the ends of the river boundary of a placer claim were usually allowed to be a sufficient marking of its extent; but, in this connection, a written notice, descriptive of the claim and containing the name of the owner, was sometimes required to be posted on the ground and recorded by the district recorder. Then, as it was frequently impossible to continue work upon a claim on account of scarcity or superabundance of water, and as miners were frequently driven from the vicinity of their claims by the severity of the winter season, the rules went on to prescribe the minimum number of days' work per annum by which a claim could be kept good, or the maximum of time during which the miner might absent himself from his claim without being deemed to have forfeited or abandoned it. In rare and exceptional instances miners may have attempted to extend their regulations to other matters than those mentioned, but I risk nothing in saying that the above statement embraces the essence of all the miners' law of the Pacific coast relating to placer claims. After these regulations had been some time in force came the discovery of veins or lodes of gold-bearing rock in place, and to them the law of the placers was adapted with the least possible change.

First. The size of claims was regulated by allowing so many feet along the vein.

Second. The mode of making out or designating the claim was prescribed; and

Third. The amount of work necessary to hold it.

The principal modification of the placer-mining law as adapted to lode claims was

upon the second point. The placers were located as surface claims and were best marked by stakes at the corners; notice and record, when required, being deemed of minor importance. In lode claims these conditions were reversed. The exact course or strike of a lode was seldom ascertainable from the croppings at the point of discovery; and as the claim was of so much of the lode in whatever direction it might be found to run, with a strip of the adjacent surface, taken for convenience in working the lode and as a mere incident or appurtenant thereto, it was found to be impracticable to mark the claim by stakes on the surface, and hence the notice and record came to play a more important part in designating the claim. They came in fact to be all-important, locations of lode claims being commonly made by posting a notice in reasonable proximity to the point at which the lode was discovered or exposed, stating that the undersigned claimed so many feet of the vein extending so far and in such direction or directions from the discovery point, together with the amount of adjacent surface ground allowed by the rules of the district. This notice so posted had the effect under the rules of holding the ground described a certain length of time, commonly ten days, within which time it was necessary to have the notice recorded in the district records in order to keep the claim good. This was all that was required under the head of marking or designating the locality and extent of the claim, and it was thereafter held by simply doing the prescribed amount of work.

This was the sum total of the California miners' law, and it has never been materially altered or added to in Nevada, nor, so far as I am advised, in any of the other mining communities of the country. By reference to sections 2319 to 2324, inclusive, of the Revised Statutes it will be seen that it is all embraced in the act of May 10, 1872, which is distinct and specific in its provisions as to the size of claims, the marking of claims, and the working of claims. What room, then, is left for any local regulations upon the only points that the miners have ever assumed to regulate? Just this: The miners *may*—

First. Restrict themselves to smaller claims than the act of Congress allows.

Second. Require claims to be more thoroughly marked than would be absolutely necessary to satisfy the terms of the act.

Third. Require more work than the law requires.

Fourth. Provide for the election of a recorder and the recording of claims.

As to the first three points it may be safely assumed that no such regulations will be adopted in any district hereafter organized. Mining districts are organized by those who discover valuable ore bodies outside of the limits of existing districts, and these first comers will be sure to take all the law allows them to take, and will do nothing on their part to increase the difficulty of holding what they have got. Later comers, not being able to deprive their predecessors of rights already vested, will find their advantage in claiming any new discoveries on terms as liberal as others have enjoyed, and it will inevitably happen that the privileges of the law will be in no wise abridged. Permission to abridge them is therefore wholly superfluous.

In some of the older organized districts the local rules do restrict the size of claims; but in no case within my knowledge do they exact as much as the statute in regard to marking and working claims. Under the regulations restricting the size of claims in these old districts rights have vested which ought to be protected; but in amending the law, with a view to its prospective operation in old as well as new districts, nothing is to be gained by permitting miners any longer to regulate either the size of claims or the mode of marking them or the amount of work to be done on them. The only effect of such permission is to make the terms of the law upon these important points everlastingly uncertain, without the least prospect of its ever being improved.

The fourth point at present left open to regulation by the miners remains to be noticed. All the district rules with which I am acquainted provide for mining recorders and the recording of claims; but under existing legislation such rules are worse than useless. The statute, it will be observed, does not make any notice or record obligatory or define their effect. If the miners themselves made no regulation on the subject, claims would be located by simple compliance with the terms of the statute, which contains in itself ample provision for everything essential to a location; i. e., size of claim and marking and working. Under the statute the vein is located by means of a surface claim, which not only can be but must be marked on the ground. When this is done all that the notice and record were ever intended or expected to accomplish is effected in a manner far more satisfactory and complete. In place of a very imperfect and often misleading description of the claim, there is a plain and unambiguous notice to the world of its exact position and extent. No reason exists, therefore, for retaining in the law a provision under which it may be made obligatory, by local regulations, to post and record a notice in addition to the marking of the ground. The monuments on the ground do well and completely what the notice and record do only imperfectly and in part.

It may be asked why, if this is so, do the miners, who ought to understand their own business, persist in requiring a notice and record. The answer is, that marking locations by such means has with a majority of miners become an inveterate habit; and

the custom, like many other customs, outlives the causes which called it into existence. For twenty years—from 1852 to 1872—lode claims were located without reference to surface lines, and, as above explained, their locality and extent could only be indicated by means of a notice. Notice and record were therefore an essential part of the system. Now, however, since the law has applied the system of surface location to lode claims, they have ceased to be of any importance as independent and substantial requirements. But the miners have generally failed to perceive that there has been any radical change in the system of making locations. They cannot divest themselves of the notion that the surface is still a mere incident to the vein, and that they must hold by means of their notice fifteen hundred feet of the vein, wherever it is found to run, notwithstanding their surface lines, as marked on the ground, may not include so much.

This ignorance of the change effected by the act of Congress, and the force of habit, are sufficient to account for the retention by the miners of the old regulations providing for the recording of claims; but there is an additional reason which has much to do with it. When a new mineral discovery is made a district is at once organized by the half dozen or so miners who happen to be first on the ground. They generally take a sanguine view of the value of their discovery; they anticipate an excitement and a rush of new locators; if rules are made providing for the record of claims and a liberal compensation to the recorder, there will be a good office for one of their number; and it seldom happens that there is not some man among them who has influence enough to secure the office and the adoption of rules which make it worth having.

It thus appears, if the foregoing statements are correct, that upon three out of four points subject to local regulation by the miners they make no use of their privilege, and that the regulations which they do make on the fourth point, having no reason to support them, are simply useless and vexatious. If this conclusion is well founded my first proposition is established: that the whole subject of lode locations is so simple that it not only may be, but actually is, fully regulated by act of Congress. That the right of local regulation ought to be taken away, if it is of no practical value, is a plainer proposition than the first. The interest of the public would be subserved by cutting off a source of endless litigation, and the mining communities would be especially benefited by the enhanced value of mining property.

The magnitude of the evil resulting from the uncertainty of mining titles will, perhaps, be appreciated when I say that after a residence of seventeen years in the State of Nevada, with the best opportunities for observing, I cannot at this moment recall a single instance in which the owners of really valuable mining ground have escaped expensive litigation, except by paying a heavy blackmail. The statute, it is true, has swept out of existence the most prolific source of vexation and expense in making the owner of a valid location secure within his surface lines. Before the statute the only means of showing that a trespasser was within the limits of your claim was by establishing the identity or continuity of the vein between the point of location and the point where the trespasser was at work. The owner had not only to bring witnesses to prove the law of his title and the facts of his title to a claim, but was compelled to incur ruinous expense in making surface and underground tracings upon the vein and in employing practical and theoretical experts to prove that his claim actually included the part of the vein from which the ore was being taken away. The act of 1872 has, as above stated, done away with this evil to a great extent by making the owner of a claim secure of everything within his surface lines, except such ore-bodies as can be followed on their dip from a valid location made outside of his lines; and as to a claim of this sort the burden of proof is transferred to the shoulders of the person who, in following the downward course of his ledge, enters the land of another.

But another evil remains. In the nature of things there must always exist the necessity in the assertion of any mining title of proving compliance with the law prescribing the conditions upon which it may be acquired; but there is no necessity for leaving the terms and existence of the law itself to be the subject of proof by evidence, the best of which is always open to dispute.

As long as there are local regulations anywhere, and as long as there may be local regulations everywhere affecting the validity of mining titles, no man can ever know the law of his title until the end of a trial in which it is involved.

In districts where the rules are in writing, where they have been some time in force and generally recognized and respected, the law may be tolerably well settled. But there is often a question whether the rules have been regularly adopted or generally recognized by the miners of a district. There may be two rival codes, each claiming authority and each supported by numerous adherents; evidence may be offered of the repeal or alteration of rules, and this may be rebutted by evidence that the meeting which undertook to effect the repeal was irregularly convened or was secretly conducted in some out-of-the-way corner, or was controlled by unqualified persons; customs of universal acceptance may be proved which are at variance with the written rules; the boundaries of districts may conflict, and within the lines of conflict it may be impos-

ble to determine which of two codes of rules is in force; there may be an attempt to create a new district within the limits of an old one; a district may be deserted for a time and its records lost or destroyed; and then a new set of locators may reorganize it and relocate the claims. This does not exhaust the list of instances within my own knowledge in which it has been a question of fact for a jury to determine what the law was in a particular district. Other instances might be cited, but I think enough has been said to prove that local regulations being of no use ought to be abolished.

Third. I am not sufficiently informed as to the effects of the practice referred to in this question to give a reliable answer.

Fourth. A vein or lode is contained in a fissure of the country rock. The strike or course of a vein is determined by a horizontal line drawn between its extremities at that depth at which it attains its greatest longitudinal extent. The dip of a vein (its course downward, Rev. Stat., § 2322) is at right angles to its strike, or in other words if a vein is cut by a vertical plane at right angles to its course, the line of section will be the line of its dip. The top or apex of any part of a vein is found by following the line of its dip up to the highest point at which vein matter exists in the fissure. According to this definition the top or apex of a vein is the highest part of the vein along its entire course. If the vein is supposed to be divided into sections by vertical planes at right angles to its strike, the top or apex of each section is the highest part of the vein between the planes that bound that section, but if the dividing planes are not vertical, or not at right angles to a vein which departs at all from a perpendicular in its downward course, then the highest part of the vein between such planes will not be the top or apex of the section which they include. The strike or course of a vein can never be exactly determined until it has been explored to its greatest extent, but a comparatively slight development near the surface will generally show its course with sufficient accuracy for the purposes of a location. The dip having an exact mathematical relation to the course of a vein is of course undetermined until the strike is determined, but practically the line of dip is closely approximated by taking the steepest (the nearest a vertical) line by which a vein can be followed downward.

The top or apex of a vein is usually the first thing discovered. Sometimes a blind lode, so called, is encountered in driving a tunnel or sinking a vertical shaft, and then of course the top or apex cannot often be found except by tracing it towards the surface by means of an incline.

Of course there are irregular mineral deposits, departing widely in their characteristics from the typical or ideal vein which seems to have been in the mind of the framer of the act of 1872. To such deposits the foregoing definitions will not apply, and in my opinion great difficulty will be experienced in any attempt to apply the existing law to them. I believe however that instances of such formations are comparatively rare, none having fallen under my own observation.

Fifth. The intended rights of the discoverer of a vein are not properly secured by the existing law. I have in two cases (*Golden Fleece Company vs. Cable Consolidated Company*, 12 Nev. 329, and *Gleeson vs. Martin White Company* 13 id. 460) intimated my own opinion that the discoverer of a lode is not compelled under the act of 1872 to mark out his surface claim immediately in order to protect his discovery. I have said that he ought to have a reasonable time for tracing the course of the lode and that if he worked diligently for that purpose, and did not unreasonably delay the marking of his location, he would be protected in his claim to 1,500 feet of the lode against one attempting to locate on his discovery while he was so engaged in making the development essential to a proximately correct adjustment of his surface lines. In the same connection I expressed the opinion that a local regulation defining the reasonable time during which a claim of 1,500 feet of the lode might be held by notice and record and work done in tracing the course of the vein would not be in conflict with the law, but in furtherance of its objects, and would be favorably received by the courts. All this, however, is a matter of very doubtful construction, and it ought to be made certain by the terms of the statute. No such local regulation as that suggested has ever been made to my knowledge, and even if there had been, and it was perfectly certain that it was consistent with the statute, it is still extremely desirable, on the grounds stated in my second answer, that whatever regulation is made should be made by law and not by local and varying rules.

Sixth. Litigation has arisen and injustice will certainly result unless the law is construed to mean or is so amended as to provide that the discoverer of a lode has a reasonable time for tracing before being compelled to mark his surface claim.

Seventh. I have understood that parallel seams of the outcrop of the Comstock lode were located by different parties, but

Eighth. As I understand the law, in all such cases the older location takes the whole vein as soon as the identity of the two seams is established.

Ninth. It will very rarely happen that the outcrop of a lode will be wider than the legal width of claims. The width of claims will not be restricted by local regulations in districts where the outcrop is too wide to admit of such restriction, and I have never heard of

an outcrop wider than six hundred feet unless the lode owned by the Richmond and Eureka Consolidated Companies at Eureka, in this State, is an instance of such excessive width. But if such a case should occur, the lode could be located under the act of 1872; the surface claim would extend three hundred feet on each side of the center of the croppings. Under the surface the locator would have the right to follow his vein to the foot-wall on one side and to the hanging wall on the other; and, as the law never sticks at trifles, what he could do immediately under the surface he would probably be allowed to do on the surface itself.

Tenth. I know of no instance in which the outcrop of a narrow lode has deflected as much as 300 feet from a straight line drawn between the extremities of the surface tracings on the lode; they often deviate more than 25 or even 50 feet from such a line.

Eleventh. I am not conversant with the practice referred to in this question.

Twelfth. I have not seen an instance of the case supposed in this question; but, in my opinion, if B had obtained a patent for his claim, it would be no greater cloud upon A's title to the dip of his lode than would be constituted by any other title to B's surface ground, such, for instance, as an actual possession by inclosure and residence. Title to that part of a lode which extends in its course downward beyond the side lines of the surface claim, has this inherent defect: the owner of the lode in following it into the land of another must always assume the burden of proving the continuity or identity of the lode he is following with its top or apex within his own surface lines; so, also, if the owner of the land into which it extends attempts to mine upon the dip of the lode, he can only be prevented by making the same proof; and this whether such adjoining land has been claimed for mining purposes or for any other purpose that gives title to the surface.

Thirteenth. I have already stated in another connection that within my knowledge no title to valuable mining property in this State has been exempt from attack. The owners have been obliged either to buy up conflicting claims or encounter expensive litigation. But most of this litigation arose out of the defects of the old system of locating vein claims without reference to the surface, and the various uncertainties of the local regulations and mining records. The act of 1872 has effected a great improvement, and if it had been better understood and more closely followed by the miners, the improvement would have been even more marked. But the miners have gone on, or at least did for awhile, locating the vein and treating the surface as a mere incident thereto, ignoring the vital necessity of defining their locations by monuments on the ground. Most of the recent mining litigation has arisen from this cause, or from the alleged failure of locators to do the requisite amount of work on their claims, or from various causes antedating the act of 1872. As yet there has not been time for a great amount of litigation to arise out of attempts to follow lodes on their dip beyond the side lines of locations, or from attempts of claim holders to mine on lodes dipping into their surface lines from outside locations. These seeds of strife are, however, germinating, and

Fourteenth. There can be no doubt that the retention in the United States laws of the provision allowing locators to follow on the dip of their veins outside of their surface lines will occasion more or less litigation in the future. There will be actions to prevent owners from so following their lodes, and other suits to prevent owners of land from mining within their own surface lines.

But I feel bound to add that, according to my observation, the right to follow the lode they have discovered as deep into the earth as it is practicable to work it is a right upon which the miners set the highest value. Any infringement upon it would be regarded by the miners of this State at least with intense hostility; and although a system of square locations, such, for instance, as the old Spanish system, might possibly prove of superior advantage in the end, I am satisfied that its adoption would be regarded as a grievance by the present generation of miners, and that its first effect would be to discourage prospecting.

Fifteenth. I have drawn up more than one set of rules for miners about to organize a district. I did this for the first discoverers of the Eureka mines, but am not sure that my rules were adopted. I think they were too short and simple to suit. At any rate the district was afterward reorganized and new and elaborate rules adopted. It was a common thing for a half dozen miners (i. e., locators) to organize a district, and on these occasions aliens participated as freely as citizens. They always chose a recorder, and sometimes a president. The president's duty was to call and preside at meetings and to authenticate their resolutions by signing the minutes in which they were recorded. The recorder's duties were more important. It was his business to make and preserve a record of the written rules of the district, to act as secretary of all meetings of the miners, keeping a record of their transactions, and especially to file and record notices of claims, for which purpose he was sometimes required to go upon the ground and note the locality, with a view to the prevention of conflicting locations and the floating of claims. Usually there was but one book for recording everything, rules, resolutions of meetings, and notices of location, and not infrequently this was a little book that could be carried in a man's pocket.

Sixteenth. I have already stated in my second answer that the fundamental idea of mining location was the taking actual possession of a limited quantity of mining ground. Miners' rules were strictly obligatory upon one point only, viz, size of claims. For the rest they merely prescribed the acts which should be deemed to constitute or be equivalent to an actual possession of the claim. No miner could hold by any means more ground than the local regulations allowed him to take, but if he chose to ignore the rules in other respects, and to incur the trouble of taking and keeping actual possession of his ground, such possession was just as efficacious as compliance with the rules. The only reason why locations were so frequently made under the rules and so seldom by acts amounting to an actual possession, was that the former method was vastly more convenient and less burdensome. The rules dispensed with the necessity of doing a great deal that would have been essential to an actual, open, and unequivocal possession, especially of lode claims, which at their first discovery were seldom capable of definition by marks on the ground.

From this it will sufficiently appear that the posting and recording of notices of claims were merely acts of possession and had that effect. The notice posted on the claim defined it by verbal description and showed the names of the locators. But this notice was exposed to destruction by the elements, and to the danger of removal or alteration by strangers, and so its record was provided for, principally in order to secure permanent evidence of the date and description of the claim. For the purpose of proving the date of a claim the record, when free from any appearance of alteration, was very conclusive evidence, and, as to this particular, fraudulent alteration was almost impossible, owing to the fact that the book was filled with records of claims in consecutive order, and one could not be altered as to date without altering those preceding and following it. But as a description of the claim the record was generally worthless, consisting as it did of a mere copy of the notice, with a certificate that it was recorded at a certain date. The requirement of the statute that the record, to have any effect, shall contain a description of the *locus* of the claim is a great improvement upon most of the miners' rules formerly in force.

The effect of recording a notice within the time prescribed by law was to satisfy one essential condition upon which the claim might be held without actual possession and to keep it good during the time allowed for doing the requisite amount of work. Doing the work perfected the claim. If each successive step after posting the notice of claim was taken within the prescribed periods, the effect was to give the locator a good title relating back to the posting of the notice and cutting off all intervening claims. And when a notice was recorded after the expiration of the time allowed for that purpose the claim was still good as to all the world except intervening locators, and could be kept good, like any other recorded claim, by doing the necessary work.

Seventeenth. No one had a right to amend or alter the record of a claim; but alterations of mining records were in fact often made, sometimes with fraudulent intent have no doubt, but much more frequently with innocent motives, the recorder and locators supposing that this was a proper way to correct mistakes of description in the notice or to effect transfers of interests among the locators or to their grantees or assigns.

Eighteenth. I have seen frequent attempts to prove fraudulent manipulation of mining records, and although they were rarely successful, the fact that they were made proves how little confidence there is in the authenticity of such records. It is certain that there is no adequate security against the loss, concealment, destruction, or fraudulent alteration of the records of many mining districts.

Nineteenth. I am decidedly of the opinion that it would be highly advantageous to abolish all mining-district laws, customs, and records; to put the whole law of locations into the statute-book, and to confide the making and keeping of the necessary records to public officers, whose fidelity is secured by bonds and their oath of office.

The record of claims, I think, ought not to be made obligatory but merely permissive, as a means of holding the claim (of 1,500 feet of the vein) during such reasonable time as the statute may allow for tracing its course with a view to the proper location of the surface lines. For the purpose of making such records I think it would be better, if practicable, to allow county recorders or registrars of deeds in the respective States and Territories to act as mining recorders, rather than to compel miners in all instances to resort to the United States land offices, which are often very remote from the mining districts.

Twentieth. I am not advised as to the feeling of claim-holders upon this question.

Twenty-first. I do consider it desirable to retain the leading features of the present law for the location of lode claims, at least in those sections of the country where the mineral deposits come fairly within the definition of a lode. For other districts another system of location may be desirable. But whatever system is to prevail in the future, I think there is no doubt that all local mining-district laws, customs, and records should be abolished. The mode of defining claims should be clearly prescribed in the statute, and so also should be the amount of work necessary to hold them and to entitle the holder to a patent. Nothing should be made obligatory in order to obtain a

patent except the discovery of a mineral deposit, the clear marking of a claim including the discovery and the doing of the necessary work. But if the present system of locating lode claims is retained, the law should be so amended as to allow the discoverer of a lode, if he desire, a reasonable time for tracing its course before marking his surface claim, and should protect him in the mean time to the full extent of his claim on the vein. This privilege should be conceded upon condition that the discoverer should post a notice of his claim on the ground and record it within ten days with a description of the *locus* appended. This being done, he should have, say, thirty days after the record to set the stakes or erect the monuments required for marking the surface claim. Until the location was so marked he should be required to prosecute the work of development with diligence.

I have no other specific amendments to recommend, but I wish to call attention to a class of difficulties likely to arise under the existing provisions of the act which ought to be obviated if possible. How this is to be done I confess I am unable to point out, but the matter is of too much importance to be ignored in revising the law.

Mining locators are granted the exclusive right of possession of their surface claims and all veins, &c., the tops or apexes of which lie inside of their surface lines extended downward vertically, although such veins in their downward course may extend beyond the side lines of the surface claim. No locator, however, has the right to go outside of vertical planes conforming to his end lines, notwithstanding the true dip of his lode would carry him beyond. In every patent of mining ground a right is reserved to other locators to follow their lodes on their downward course into the ground so conveyed. (Revised Statutes, section 2322.)

This being the law the annexed diagram illustrates a few of the numberless difficulties that will occur in applying it to surface locations that have not been made in exact conformity to the true and ultimately ascertained course of the lode. The line O P represents the course of a lode extending due north and south, and is supposed to be drawn between its extremities at the depth of a thousand feet from the surface. The dip of the lode is to the west and the outcrop appears at two points *x* and *y*. The top or apex of the lode where it does not reach the surface is indicated by the dotted line connecting *x* and *y* and extending beyond in either direction. Long before any better means exist of ascertaining the true course of the lode than is furnished by its outcrop A makes a location at *x* marked *a a a a* and B makes a location at *y* marked *b b b b*. In due time their claims are patented. Then C discovers the lode at *z* and makes his location *c c c c*, and later still D and E make locations as indicated, north of A and south of B respectively. The straight dotted lines A *a* A' *m* B *b* and B *b* indicate the sections of the lode the tops or apexes of which are inside of the surface lines of A, B, and C respectively. The dotted lines *d a* and *e a* and *f b* and *g b* show the sections of the lode which are included by vertical planes conforming to the end lines of A and B respectively.

Now come the difficulties. According to my definition of top or apex of a lode, and under what appears to me the only admissible construction of the law, C, although he locates after the patent to A and B, is nevertheless the owner of all that section of the lode included by the lines A' *m* and B *b*, indefinitely prolonged, notwithstanding it is mainly included from the very top in the prolongation of the end lines of A and B. C is the owner because he has located the top or apex, and A and B are not owners for the reason that their claims do not include the top or apex of this section. Supposing the lode to be valuable, it can readily be seen what controversies will arise as the progress of development begins to show the true course of the vein, and enlighten the parties as to their boundary rights. Even without the intervention of C, A and B would come in conflict at *h* in regard to the widening section *f h e*. But in the case supposed, C would restrict A to the line A' *m* as his southern boundary, and B to the line B *b* as his northern boundary. By this means A and B, being restricted by their end lines from mining on the widening sections A *a d* and *g b* B', would be completely cut off—A at 2,000 and B at 3,000 feet from the surface. Then this further difficulty would arise, that the entire top or apex of the lode being included in the various surface locations of A, B, C, D, and E, there would be no means under the law by which the widening sections A *a d* and *g b* B' could be located or granted. The only remedy would be to cancel the patents of A and B, and allow them to readjust their surface lines. Before this, however, another controversy would have arisen between B and C, and still another between B and D, in regard to the excessive claim of B on the course of the lode, which it will be seen extends to a length of about 1,600 feet, whereas the law allows him at the utmost but 1,500 feet. These hints will suffice to indicate the nature of the task which the commission have before them; and having no plan to suggest for meeting the difficulties in their way, I take my leave of the subject.

Twenty-second. I have formed no opinion upon this point.

Respectfully,

W. H. BEATTY.

The PUBLIC LAND COMMISSION,  
Washington, D. C.

*Testimony of Edwd. R. Chase, civil engineer, Elko County, Nevada.*

The questions to which the following answers are given will be found on sheet facing page 1.

WELLS, ELKO COUNTY, NEVADA.

September 12, 1879.

*To the Public Land Commission, Washington, D. C.:*

GENTLEMEN: Your circular letter asking replies to certain interrogatories, &c., is before me. Holding in view the object of the Commission—i. e. the scope of inquiry adopted, and the method you have taken to obtain the information sought—I find it my duty to declare it as my opinion that you will gather but very imperfect information upon the subject of agriculture and agricultural interests; and I bespeak your most careful consideration of our interests and wants.

We are a simple and unlettered people. We have a profound faith in those maxims that teach us that our government guarantees to us justice, humanity, and "the greatest good to the greatest number." Believing so, and that the public lands are the people's heritage, and held in trust by the government for the people, we hold that every acre "is and of right ought to be" dedicated as homes for the people. "The people" express a vast, silent, and passive quantity—an immense organ upon which any tune can be played that you desire the keeper to have uttered. Play us all you wish, gentlemen, but don't let us break down or go to pieces, because you wish different tunes played at the same time; and remember, in considering the replies you receive to this circular that this "vast organ" don't give the replies that some individual is playing it.

1. My name is Edward R. Chase. I am a farmer, and live in Clover Valley, Elko County, Nevada.

2. I came to Nevada while it was a Territory, and have not been out of it since 1864, and have never crossed a county line within it.

3. I have sought to acquire an 80 "homestead" title; no other.

4. I have had the amplest means of knowing the practical working of the land laws in Nevada and elsewhere.

5. I know from personal experience, after refreshing my memory from memoranda, that it takes more than ten years' time, and costs more than \$400, to get a homestead patent to 80 acres—the case was not a contested one\*. I know and declare that in another case, that of H. H. Chase, my brother, whose lands adjoin mine, who made the earliest location in the country, who settled his lands when his nearest neighbor was 50 miles off, who never lived off of them, who claimed only a homestead, who never permitted any laches and was never charged with any unfairness, moved onto his lands, in 1867, has traveled over 800 miles, has spent \$500, and has, like myself, received no patent. I have never known a patent to be obtained but in two instances; in one case it cost more than \$75; in the other I do not know the cost, but do know it cost over \$50.

6. I can hardly say that there are defects inherent in the system, but think a few important amendments should be made in the law, and many corrections in the practice.

1st. In this country many valuable pieces of land would be taken as homesteads if they did not lay so low in the valley as to make it wholly impracticable to live upon them. We want farms in the valley and homes along the foot-hills. The law should not require an actual residence upon the land, but the final proof should go to show that the homesteader neither owned nor claimed a more valuable home anywhere else.

2d. As only those lands lying along water-courses are eligible as farms the stripes are often narrow. Taken in quarter sections (contiguous forties lying side by side) the claimant does not get on an average half good land. Contiguity by corners ought to be permitted in homestead claims.

3d. I can think of no reason why a homesteader should go before the register and receiver. I cannot make the journey for less than \$50. Section 2290 should be so amended as to read: "before the register or receiver or the nearest magistrate" (whose official certificate should state such fact)—"that he is the head of a family," &c. Section 2262 should be similarly altered. All laws that require a sworn statement to be made of or concerning lands should be made before the magistrate living nearest the lands. The certificate of the magistrate should state such fact, and that he knows the witnesses, that they are credible persons, residing in the immediate neighborhood (in case of final proof) While it is more expensive to go before the register and receiver, it opens the door to fraud, in a country sparsely settled like this, as it is more difficult to perpetrate a fraud at home, where the facts are all known to everybody, than at the land office, where they are known to nobody. The official character of the magi-

\* The only issue presented was, are certain improvements on the land. The owner says they are a fact never questioned. It is charged as one of the hardships of the system that the Commission did and does, without any reason or necessity, order expensive contests, and involve the cases in delay and cost.

may be established by the seal of the county clerk, if necessary. Pensions are paid on bounty lands issued upon proof taken similarly; there is no reason, and great hardship, in not permitting it to be done with the land office.

The desert-land act is open to the same criticism—or rather not the law, but the rulings of the Commissioner. It is a grievous "put" upon us to compel us to journey to the county-seat with two witnesses known to the clerk to be credible and who are acquainted with the land. The law says "we may file an affidavit." The Commissioner takes it upon himself to say before whom that affidavit must be made.

The timber-culture act is similarly restrained in its operations. The act declares that the initiatory affidavit may be made before an "officer authorized to administer oaths in the district." The Commissioner by a recent ruling absolutely ignores the law, and will not, as I am informed by letter from the Land Office, accept of a filing made before a local magistrate. Laws are to be construed according to the intention of the law-makers. When the framers of the law used the language, "an officer authorized to administer oaths in the district," they as clearly meant any officer authorized to administer oaths as they did that an oath should be administered. When they said, in the desert-land act, "may file an affidavit," they as evidently did not mean to direct before whom it should be made as they did mean to direct before whom it should be made in a homestead application. When they use the language, "shall make an affidavit before the register and receiver," &c., what difference can it make to General Williamson, to the country, to the cause of justice? As it makes none, and by no possible contingency does it make the Land Office safer against fraud, we must look for the reason in some way as appertaining to the Commissioner himself. We complain and believe that the Commissioner of the Land Office is an enemy of the homestead act; that he has stood defiantly square across the path of the homestead settler and fought us off with all the diablery he could invent. Authorize one of your Commissioners to come down among the people and take the sworn statement of the first dozen farmers he can find in Nevada; my word for it, you will feel it your duty to go outside of the act prescribing your duties and to report a code of rules of practice that will relieve the Commissioner of the obligation of exercising any discretion. The wrongs and outrages the local officers have perpetrated upon the people will never reach you, responsive to this circular; the farmers are, as I have said, voiceless; many cannot write; few can understand such terms as parceling surveys, physical characteristics, humidity of climate, and codification of laws; they know if they could have been permitted to buy their lands as desert lands they could have obtained them much cheaper than under the homestead laws. Local rather than general changes should be made in the law. We are wronged, and need legislation to repair the wrong.

1. The rule of double fees and commissions going to our land officers on this coast is simply a venerable swindle. When the rule was adopted it cost so much to live here that it was deemed no more than right. If their pay is not enough, government ought to raise it. We get poorer lands; have to travel farther to get them than any people do.

2. Our lands within railroad limits should have never been raised to double minimum. It is a fact, patent and clearly beyond question, that farms near the road are of less value than those remote, and the value increases as we recede. Reason: our markets are in the mining towns off the roads. And again, when farm produce is high the roadsters always enter into competition with us, and we nearest to them get it worst. At the recent time they are delivering baled hay for eight-tenths of one cent per pound, and charging us farmers \$2.45 per cwt. for iron, salt, &c.

Our Representative in Congress has always been in the interest of the railroad company; hence I could never get these facts before the Land Committee. If our lands were reduced to \$1.25 per acre the railroad company would have to reduce theirs.

3. The railroad lands ought to be restored to market. I have recently given fully my reasons therefor in a letter addressed to the Commission in Salt Lake City, to which I refer. The rules of practice need to be changed in one important respect: A man who makes an honest, fair location, pays his fees, and performs all the obligations the law imposes upon him, ought to be protected against expensive litigation. Instance: Mathews took east half southwest quarter, 12, 36, 59, Elko district, under the desert law; it was on the bottom, and not eligible as a residence; he worked for a man, and lived in a house 100 yards off the land; he owned no other land. A Mr. Joseph W. Allen made an affidavit that it was not desert land; he did so in order to set up a claim and get into possession and gather a valuable crop of hay; he entered and took off the hay. The General Land Office ordered a hearing; I attended the hearing for Mr. Mathews; he brought nine of his neighbors, who all testified that it was desert land. There was but little conflicting evidence. When the testimony was in, occupying three days' time, the receiver, Judge Carpenter, demanded \$50 of him, which he paid, as an estimate of one-half the expense of hearing, &c. The rules of practice declare that the expenses shall be borne equally by the parties. The land is not worth \$100; and it is wholly against legal precedent to burn a man and then make him pay for heating the poker. Mathews had known that he not only had to pay all his witnesses, his attorney, and \$50 besides, he would never have paid the money or contested the claim. The rules

should be so altered as to have the hearing before a magistrate, responsive to pointed interrogations. Keeping the facts in this case in view, no hearing should have been ordered until Allen filed affidavits alleging that the land was such "that no agricultural crops could be successfully raised without irrigation," or that "there were springs or other natural sources of water on the same to irrigate all or a larger part of the same." Then the fact of its aridity would have been put in issue, and those questions, and only those, should have been asked the witnesses. The hearing was ordered on the testimony of Allen and another that the lands were not desert lands, the understanding desert lands to be lands that nothing will grow on without irrigation, whereas, as it transpired, a little hay could be cut along the swale any year.

I do not believe there can be adopted any system of land-parceling surveys, as no geographical divisions can be made and to preserve the topographical system in its correction and township lines must be adhered to; and as there appears to be no great necessity for permitting mineral-land surveys to disturb them, I should recommend that the correction and township lines should be run that all irrigable and timber lands should be sectionized. I should adopt the following classification: All lands are *desert* lands; all lands are *pasture* lands; *timber* lands are not irrigable, and as such lands as are more valuable for their timber than for pasturage or minerals; *arable* lands are irrigable lands and more valuable for hay or grain raising than for any other purpose; *irrigable* lands are lands that it is possible to irrigate. Mineral lands being lands that are of no value for agricultural purposes, can only be defined as non-irrigable lands that are more valuable for the metals contained within them than the timber that covers them.

I would hesitate to recommend any other system for the disposal of lands than the present. I would repeal the desert-land act; it is in direct conflict with our homestead theory; it is an offer of a section of land at \$1.25 per acre, while the homestead settlers are restricted to 80 acres within railroad limits, and pre-emptors to 160 acres at \$2.50 per acre, of precisely the same lands. I would so change the present law that a failure to come forward and show that the lands had been redeemed and the law fully complied with within thirty days after the expiration of three years would work a forfeiture and a vacation of the location and the lands become restored to market.

10. In my view the better system sought for the disposal of the public lands would be to restrict all to homesteads of 80 acres or a less quantity contingent upon seven years' residence and cultivation. It rests quite within the possible that a system of artesian boring may make our desert lands productive, and it is impracticable and un-American to create large land owners. If our desert lands are of some value for pasturage, the easement should in equity go to the settler nearest.

#### SUBDIVISION—AGRICULTURE.

1. I should divide our seasons into the wet and dry. We get very little rain during the crop-growing season. Snowfall in winter supplies us with means of irrigation in summer.

2. Answered in the above.

3. Not one acre.

4. Perhaps 1 acre in 1,000.

5. Wheat, barley, oats, and potatoes.

6. Am unacquainted with water measure.

7. All appropriated, and people quarreling over possibilities.

8. I think my land is gaining in fertility (owing to the waste of alkali).

9. Crops can be raised at an altitude of 7,000, I think; they are raised over 6,000. I think the ranches in Secret Valley, Humboldt range, are over 7,000. It is the popular belief that the higher we get the safer we are from frosts, and that if we could farm the highest ravines we would be secure.

9. In our vicinity we have small streams and use all the water we take out of them for irrigation. There are no general or local restrictions placed on the use of water other than the laws.

10. All water has been taken up by turning it out of its channel, under the act of 1866, sanctioned by local custom and the decisions of our courts.

11. So far only upon questions of fact.

12. I think all lands should be called pasture lands that are not irrigable; therefore conclude 999 acres in 1,000; but much of the pastoral lands is of little value for pasturage, and when once fed off are nearly worthless.

13. No. No.

14. No. No. Grant them to the State in lieu of swamp lands; let us have them for educational purposes.

15. Don't know.

16. Two hundred.

17. Don't know, as great changes have recently taken place. Our county once

ied more than 100,000. Our ranges are destroyed, and I think we will not winter 5,000.

18. Declined. Very much; fast disappearing.

19. No, they do not fence; but control the courts and so far have pastured our farms off and prevented the question of free range from reaching the supreme court.

20. I think not.

21. Springs and creeks.

22. Don't know.

23. Disappeared.

24. No.

25. None; some scolding.

26. Ten cattle to one sheep. Bands of all sizes.

27. None.

27. Very little, I think.

#### TIMBER.

1. Very little; mostly nut-pine.

2. None; we have no fencing, and my planting has been utterly fed off with predatory herds.

3. If at all, in 40-acre lots for fuel.

4. No.

5. None.

6. No destructive fires.

7. No despoiling; all used for fuel.

8. No restraint; take all you need.

9. No; it would only be another source of revenue to the most corrupt set of officials ever known. The entire gap between the first register, Davis, and the last receiver, Carpenter, in Eastern Nevada, both of whom are unexceptionable gentlemen, has been filled with unworthy, unjust, bad men, that have oppressed and robbed everybody. No better men can be found in any department of government than the present officers in this section, but we all fear their removal on that account, and to leave the lands in the hands of men who can bounce us for nipping a load of fire-wood would be hell. When John S. Mayhugh was register of the Elko office I once received a business proposition from him to report Crawford of spruce anent, and others, and he would cinche them and divide. The same officer told me that he went to General Williamson in Washington to get some business done; he referred him to a clerk, and he had to stand blackmailing of the grossest kind. You have my authority and the data.

#### LODE CLAIMS.

1. Have litigated many claims; am or was a mining engineer; am a civil engineer

2. I have little useful knowledge on the subject.

3. Doubt the wisdom of it. Don't know.

4. Croppings. Line of strike as well as angle of dip change very much in the small veins of Eastern Nevada. No man can tell where a vein runs without following it.

5. When veins are narrow and near each other it would be the safer way to confine all within the limits of a superficial survey, because "faults" are so common and the slides so extensive that when a vein is once lost there is no defining it when found. It is generally assumed that the first one struck in the line of progress is the one lost. There is no certainty of it; lateral faults and dikes often obscure the question, and it is the principal source of litigation. I would make no survey a test. Let him who first discovers a vein locate under or above ground and define his rights thereto in the courts. If he thinks his neighbor is on him, trace him off.

7. Frequently; and have known them to run together, and have known them to do the opposite.

8. Answered, no.

9. No; I have never seen one. Ore is frequently scattered over much surface, but when the vein is reached within walls I think it will in all cases of fissure veins in Nevada be inside the limits.

10. Yes; not so frequently from the angle of dip as from slides.

11. Disadvantage, I think.

12. Such is unquestionably the evil of permitting false locations, and whether or not injustice has been done, it is clearly the case that it can be, and individual cases will not help the question, although there are many.

13. Yes.

14. They should be unquestionably permitted to do so.

15. Five or six, none of which are now important. It is usually done by prospecting parties, consisting of two or more, electing a secretary and president and adopting laws. Usually a copy of a code is carried on such expeditions.

16. Parties then record their "finds."

17. I know of no rule or precedent for amending it.

18. It used to be frequent; I do not know how to prevent it.

19. I have given the question mature deliberation. I see many objections to it. Prospectors find what they hope is good; they wish to secure it; other parties are prospecting all around them. Written evidence of some person authorized to make a record is the one thing needed. It is possible that a rule requiring all mines that the owners wish to preserve after one year or more should be placed on record at the local land office would do, but with the record the Land Department has made for itself I think the miners would make a mutiny.

20. There is grave doubt about it. The courts appear to be the safer, but involve much more delay and expense. I would not have confidence in the Land Office; others might.

21. "It is better to bear the ills we have than to fly to others that we know not of." &c. The above idea has crystallized in many languages, in many ages, in many forms of words. It is my answer.

22. Yes; I think this answered in interrogatory 19.

#### PLACER MINES.

I have never seen one; my information on the subject is limited to statements of cases made by others.

#### SUMMARY.

First send you each his individual check to the Central Pacific Railroad and Union Pacific Railroad Companies for the expenses of your junketings across the continent to attend Grant's reception, and be at liberty to give an honest opinion.

2. Ask an investigation into the charges brought in this communication against the Land Office.

3. Leave the present system and the present local officers in their places. They are honest. For God's sake let the General Land Office try to conform to that method of business. It may be difficult at first.

4. After reading the pre-emption law, the homestead law, the desert and timber culture acts, reflect that they were acts made by the people for the benefit of the people; that they were intended to be, and of right ought to be, carried into effect in the cheapest and most convenient manner consistent with the act, due regard being had to ample protection against fraud. Then you will find that the pre-emption and homestead acts should be at once altered, so that all verifications could be and should be taken before the nearest magistrate; that the desert act and timber-culture act should be carried out in the same manner. The only remedy in the latter cases is to convince the Commissioner of the Land Office that his rulings requiring the affidavits to be made before a court of record is wholly unjustified by law, inconvenient, and unnecessarily expensive. The county clerk and district judge are no more federal officers than a justice of the peace; there is no law to compel them to do any such business, and in our county they wholly refuse to do so. Claims for bounties and pensions, for commutation and back pay, and for military and all other claims against government are established by affidavits made in the manner indicated, the official character of the magistrate being verified by the certificate and seal of the county clerk. The difference in cost to me or any neighbor of mine would be \$40 to \$75. Why, then, does the General Land Office exact it? In the belief of nine-tenths of the farmers, that they may be hindered and discouraged from seeking government lands and purchase lands of General Williamson's friends, the railroad company—poor ostrich!

5. Government lands within railroad limits should be reduced to \$1.25 per acre.

6. Railroad lands should—all that were not positively conveyed by the government before three years after the final completion of the road—be made subject to settlement and pre-emption like other lands, at \$1.25 per acre, payable to the railroad company. For all future time, let whoever may pretend to be the owner. All lands accepted by the railroad companies after that time were subject by the act to that contingency.

7. All lands on odd sections within railroad limits, not conveyed at this time, should be withheld. They were unquestionably a gift; they were granted to them provided that they should keep their telegraph line and railroad track in condition, so that they could pay their bonds in the manner they had agreed to. It was no legal consideration. If it had been, even, it was declined; because section 3 indicates when they were to accept it—when a section of 20 miles had been completed and accepted, the bonds shall issue, &c. The law cannot bear the interpretation they seek to give it: it would be unconstitutional. Congress had and has no power to dispose of the public land in such a manner. It would not be a "needful rule or regulation," and would be clearly against the "general welfare." When a latent ambiguity exists, a law is to be interpreted at all times consonant with the Constitution. A gift is a gratuitous offer; it cannot be in *futuro*. Not being based on a consideration, it cannot be enforced.

With great respect,

EDWARD R. CHASE

*Testimony of Gov. William A. Howard, Hon. Granville Bennett, and others, Yankton, Dak.*

YANKTON, DAK., November 7, 1879.

*The Public Land Commission :*

**GENTLEMEN :** In response to the request of the Commission, I have the honor to submit the following remarks upon the subject-matter of your inquiry. These responses are prepared upon a few minutes' notice and are written off without review, but spring from previous thought and considerable experience.

1. I was for about four years the United States surveyor-general for Dakota Territory, and have executed numerous contracts upon the public land surveys within Dakota, besides examining, as inspector, the work of many other deputy surveyors. These duties have taken me over the whole of Dakota, except the extreme northwestern part, and over much of it repeatedly. I am forty-two years of age, was born in Indiana, and have always lived in public land States or Territories. Am a graduate of the University of Michigan, both from the literary and law departments, and have had some practical familiarity with surveys since I was sixteen years of age.

2. The public lands of the United States are an important trust for the people, and are to be used mainly for two purposes: (a) to furnish cheap homes for citizens; (b) to aid in fostering free public schools. There are mining interests, of course, to which I do not refer now; and the grazing interests are deemed agricultural. For all these purposes, especially for all agricultural settlements, the lands must be kept cheap. The policy of the nation has uniformly observed this necessity. There is no purpose to create much revenue from these lands. We do not doubt but this is the correct theory, and that it will continue to be the practice. This, then, demands an economical system of surveys for all agricultural and grazing lands. That necessity is at the door of the inquiry, from my point of view.

3. The present system of rectangular surveys is economical. The cost at present is but little over three cents per acre, including pay of deputy surveyors, the salary, office and assistants of the surveyor-general. This cost cannot be reduced in any part if the system is retained; and no other system that I have seen proposed can be substituted without a very great increase in cost, which would necessitate large appropriations of money, or a marked and very unpopular advance in the price of the lands. It would endanger the homestead system, now so popular and giving such excellent results in the Northwest and West. I fear that we should soon have a demand that all lands be sold at double minimum price, instead of given for residence and small fees.

3. There would be little use in a more accurate and careful survey unless more permanent and far more expensive monuments were planted to perpetuate boundaries. The present monuments are of wood or stone, further aided by mounds of earth and pits. There is a long remove between these and any other material. The next practicable materials are iron or pottery. I have not data as to probable cost of these in the field when used, but it must be many times that of wood or stone.

5. The present system of surveys is reasonably accurate and uniform so far as I know it. It conforms closely to measurements and tests otherwise independently applied in engineering operations for public works. The distance from Dubuque to Sioux City, Iowa, as traversed from railroad engineering and public-land surveys, agrees. That on the public lands was done by many different deputies at differing seasons, when they were exposed to dangers (one lost his life), and received small pay. The railroad engineering was by one party with most ample equipment and good pay, and was a continuous line. When Lieutenant Warren made a journey through Southern Dakota many years ago, he located some points astronomically. This was before public-land surveys. From these and similar data the first official maps were made. When the public-land surveys were extended over this region they concurred with those points so fixed, and connected, sometimes many miles, all topography otherwise obtained and mapped. Other like proofs of reasonable accuracy are obtainable in many places. This is true along the Northern Pacific Railroad. But the same or similar tests will show errors in land surveys. Sometimes these errors are bad. They arise from a gross violation of duty by deputies; from a lack of skill, or, more often, a great lack of integrity. But these errors are mainly local and limited. The rectangular system checks its own errors, and leaves its fractional excess or deficiency at regular recurring places. These errors are measured, ascertained, noted, and checked. I also testify my belief that these errors are largely of the past, and that now very creditable and accurate work is done. This the government can secure uniformly by an inexpensive system of inspection, now used in part.

6. Correctly executed, with posts of wood or the stone monuments (both used now by many, the post for section and the stone for quarter-section corners), the charred stake, and the mounds and pits, the surveys endure very many years. I think when so built, as I believe they now are by every deputy surveyor in Dakota so employed, and finished according to the law and instructions, they reasonably answer the requirements of an economical land system. If we had feudal estates and vast and

valuable private domains a more expensive system would be desirable. The present serves its purpose until the greatly increased value of the lands as private property shall justify private owners in replacing government monuments with costly and permanent ones.

7. The rectangular system should by all means be retained so far as agricultural settlement is expected to extend. Its nomenclature is perfect. No other could be substituted wholly for it. The distinctive features of that must be maintained for a popular system. It is quickly understood by native and foreign immigrants alike. Any departure in agricultural regions must, therefore, be but partial and subordinate to this, dependent upon it and assimilated to it. This supposes that in certain cases as in small hilly tracts, bends of rivers, on shores of lakes, where the lands are only suited for pasturage and are exceptional, where considerable forests occur, and in similar cases, it would be desirable to have larger or irregular tracts. I further remark why the rectangular system should be retained, speaking especially as to Dakota Territory:

(a.) East of the Missouri River this system is largely extended and is advancing toward completion. The standard lines are run and established much beyond the subdivisions in places. The exterior township lines dependent on these are partially established also, and the subdivisions are irregularly advanced within these. A large area is sold and settled upon and cannot be disturbed. Thus the only feasible plan is to complete this system at least to the Missouri River.

(b.) The act of Congress organizing Dakota Territory and providing for establishing the office of surveyor-general therein is a sort of public contract with all settlers and with the people in their governmental capacity that this system should continue.

(c.) The same act reserves sections 16 and 36 in every township: "Are reserved for the purpose of being applied to schools in the States hereafter to be erected out of the same." (12 Stat., page 243.) This involves the highest interests and good faith, and I cannot see how it can be violated or its pledges fulfilled under any other system. Now, holding the office of superintendent of public instruction for the Territory, I know how large an interest this is and how important a place this inchoate resource holds in the just expectations of our citizens.

(d.) There are grants to railroads, mainly to the Northern Pacific Railroad Company, whereby alternate sections are donated for the building of that important highway. This line is constructed nearly to our western boundary, and the surveys with a grant eighty miles wide, with twenty miles additional for indemnity lands, are in every stage of advancement, from completion at the eastern border to partial beginnings far west of the Missouri River.

(e.) Our general and local laws, in fact to a considerable extent our local government operations, are based upon rectangular surveys. With slight exceptions the boundaries of counties, townships, school districts, and other subdivisions coincide with and are described by this system. Unorganized counties are declared partly in advance of surveys by theoretic lines soon to be run, so settlers may know upon what to depend in these respects. Our tax laws, our legal forms, and often the very jurisdiction of our courts, rest upon these lines. They are an indispensable public convenience.

8. With the exception of the Black Hills and the Bad Lands of the White and Little Missouri Rivers, and limited adjacent regions, and some undetermined area in the northern or northwestern parts, Dakota is a series of vast plains, over which this system can be extended as feasibly as over Iowa or Eastern Kansas or Nebraska. It therefore seems that over all but the southwestern part, and over much of that lying toward the Missouri, the rectangular system should extend. I do not here intend to say that it should not extend over much of the regions excepted.

9. Strongly convinced of the merit and the practical success, and even legal necessity of this system, and believing it to be now very excellently and faithfully executed, I would yet not object to a certain limited modification of the practical work. So far as the standard parallels and guide meridians are concerned, it would perhaps be as well or better to expend more money and greater care upon them, and to fix the monuments thereon with permanent materials. The standard lines as these are called are the real geographic lines. They are connected and continuous. The parallels are intended to be true parallels, having the curvature due to their latitude and the oblateness of the earth and to run continuously and without break east and west. The guides are less important and check between the parallels. If these lines could be run and established by careful triangulation and their corner boundaries permanently marked, the errors of the present system, which are not great now, would then be immaterial even for geographic and other considerations above the mere demands of parceling and selling lands. While saying this I yet contend that lines have been run and are now being run in this Territory—even in the Black Hills, over its roughest parts—that will stand severe tests. They have not all been so run, and I wish to see all the standard lines thus precisely established. But, I repeat, I do not regard it ever practicable and by no means necessary to carry this to all the details. If in extending the standard lines thus by triangulation a region is found demanding by its mount-

sinous character the same care in its details or other departures from the general system, the change could be specially and locally made. I do not see any objection to pushing this system of standard lines over the whole interior, for it would thus furnish the convenient base lines and initial points conveniently at hand for all the modifications of the system required by the features or characteristics of any particular region, large or small. So I would preserve the rectangular system and its nomenclature and subdivisions wherever convenient or best adapted to the country as it is in nearly all Dakota.

10. The present system of administration under surveyors-general I would retain. It is easily shown, I think, to be most economical. The same work cannot be done for the same cost in Washington City. The survey office should be near the local land offices, and in the general region to be surveyed, where it can observe all the facts which bear upon the questions before it. Thus it should observe the volume and tendency of migration and the probable future tendencies of settlement. It should know something clearly of railroad and other enterprises which would affect given regions and require surveys. Not the least of its intelligent duties is to know the agricultural successes and failures, their causes and permanence. These all bear directly upon the question of surveys, and they can never be properly known except by a *resident* officer. As to mineral surveys, it seems that a surveyor-general and his local supervising office are a necessity. In no other way can the interests be accommodated. The interests subserved by the office are more local than federal, and all the bearings of the duties can be properly observed and weighed only by a local office. His responsibility to the general government can be as well provided for as if his office were in Washington City, while his public usefulness is far greater.

11. Dakota Territory has a larger body of unsettled but valuable public lands that are agricultural without irrigation than any other three surveying districts combined. It is nearly all agricultural. Its present crops testify this. East of the Missouri River 95 per cent. of it is so fit for agriculture, and a large part of this is first-rate. West of the Missouri a smaller per cent. is agricultural and a large part is grazing land. Even there close about the Black Hills agriculture has shown remarkable success.

12. The Black Hills I have examined and would like to describe, but time does not permit. I have no personal interests there now nor prospectively. I testify disinterestedly. The people are enterprising and of the best material, having only a small element of lawless persons. They have as good schools as many older regions. The teachers are educated and efficient, and the mental capacity of the pupils is rather above the average. I have visited nearly all the schools there. The country contains vast wealth, which is now rapidly developing. To me the examination opened wonderful resources, and I believe within a very few years it will be regarded as the most wonderful region upon the continent for wealth in gold. Its present showing deserves the consideration of the government.

These views, opinions, and facts are stated upon my knowledge and candid belief, and are convictions formed from eleven years' residence in Dakota. They are not influenced by any fancied or real personal interest, but rest on the facts and public interests. The rapid work in writing them leaves many other arguments that occur to me unmentioned.

The present settlement laws of the United States are as applicable to the lands of the United States in the Territory of Dakota as they were to government lands in the States of Iowa and Minnesota, excepting there should be new and stringent legislation enacted in regard to the care and preservation of the timber lands belonging to the government in the Territory. The mining region, known as the Black Hills, in the southwestern portion of the Territory, of course, comes under the present mineral laws of the United States, and would be affected by any changes in such laws the same as other precious mineral-bearing regions.

I have the honor to remain, very respectfully, your most obedient servant,

WM. H. H. BEADLE.

The following were all present and fully concur in the within: Gov. William A. Howard; Hon. Granville G. Bennett, Delegate in Congress; Major F. J. DeWitt; Judge W. W. Brookings; Hon. William P. Dewey; G. A. Wetter, register, land office; Lott S. Bayliss, receiver, land office.

*Testimony of Robert M. Catlin, civil and mining engineer, Tuscarora, Elko County, Nevada.*

The questions to which the following answers are given will be found on sheet facing page 1.

*To the Public Land Commission:*

GENTLEMEN: I have been instructed to answer such of the inclosed interrogatories as may be within the range of my personal information. Having been absent from

home for some time, I did not receive the paper as soon as otherwise I should have done; hence my delay in obeying the instructions therein contained. I will refer in each answer to the number of the question, without restating it.

1. My name is Robert M. Catlin; reside in Tuscarora, Elko County, Nevada; profession, civil and mining engineer.

2. Four years and a half.

3. No.

4. My experience has been confined to mining-lode claims.

5 and 6. About \$325 for a lode claim, and the time varies from six months to three years. I cannot understand why (as is frequently the case), when an application is forwarded to Washington, after passing through the local land office, it should there remain so long without hearing something of it. If it is informal, the applicants ought to be notified at once. I have known patents issued before another which was applied for two years before it had been even heard of, and after a while the last, which should have been first by years, comes, and meanwhile the applicants have heard nothing. The above facts would give color to the impression prevalent here that when a mining patent is applied for it is quickest and cheapest to fee some patent lawyer in Washington (of whom there are many) claiming to have "immense facilities," &c. The present rules may be good enough, but there certainly is something wrong in their working, and mining men are beginning to feel that it takes so long to get a patent that it is hardly worth while to apply for one, as in nine cases out of ten they can work out the ore-body contained in their claim long before they can get a patent. Hence the government loses not only the price of the land, but also the mineral is rapidly being taken from the government lands by a sort of skimming process.

7. Elko County contains a large amount of grazing land and a great amount of mineral wealth. There are a few valleys where barley is grown by irrigation, and the timber grows in little patches in the mountain gulches. Very little timber.

8. In our vicinity, I opine, a general rule would be about the only way practicable.

9. The present system appears to work very well. I have been county surveyor.

10. Have never thought of any better plan.

#### AGRICULTURE.

I know very little about agriculture, as it is but very little followed here.

#### TIMBER.

1. We find wood in the mountain gulches and on the mountains, but it is not abundant. Willow, quaking aspen, and alder are found in the gulches, while white fir and a scrubby pine are sometimes found on the mountain sides.

#### LODE CLAIMS.

1. Have been United States mineral deputy surveyor for four years in Elko County.

2. I have found that locators make their locations in such a haphazard way that often it is almost impossible to tell where their claims were originally situated. They locate upon the first discovery of mineral, without much prospecting to determine the course of their ledge. Frequently they locate at right angles to the course of the ledge, and another comes along, and finding, as he supposes, a cross-ledge, locates in good faith. Soon, however, the first party finds the true course of his ledge and orders second party off, and, having pulled up his own original stakes, resets them, and second party has no remedy for it. May be he has gone on in good faith and expended his money freely, while first party lays back and lets him prospect, and when he develops the course of the ledge first party claims it, knowing that there is no record of the original course of his claim, and being able to prove priority of location and that the second party is on the same ledge and within distance of his location point, it frequently happens that great injustice is done. I have often thought that the law should require a locator to designate the course of his claim. Nearly every prospector has a compass, and in case a surveyor is not available he can himself describe his boundaries with sufficient accuracy. In case a surveyor is available, as is usually the case in most camps, his records would save many a dollar to men who now are at the mercy of any prior locator whose location point is within a quarter of a mile of him.

3. If some such provision were made in the present law, I think conflicts under the head would be avoided.

4. I think the apex of a vein is the line such vein would make in its intersection with the surface, calculated from its true dip at each point. The course and dip may usually be determined within a year from location.

6. Occasionally, but rarely.

7. Very rarely; once or twice.

8. The claims have not been of much value and are not worked.
  9. Very rarely; never in my experience.
  10. Very often.
  11. Frequently to disadvantage.
  12. I have never known of it being done.
  13. Sometimes; very rarely.
  14. I think the present law adequate.
  15. Never.
  16. The notice usually only gives the number of feet, names of locators and of claim.
  17. No.
  18. No.
  19. Yes.
  20. Yes, much more satisfactorily.
  21. I think of no other suggestion than that contained in No. 2.
  22. Two years ought to be long enough.
- Have had no experience in placer claims.

Respectfully,

ROBT. M. CATLIN,  
*Tuscarora, Nevada.*

*Testimony of B. F. Leete, Reno, Washoe County, Nevada.*

The questions to which the following answers are given will be found on sheet facing page 1.

L. & M. EAGLE SALT MINE,  
*Reno, Washoe County, Nevada, December 6, 1879.*

*Public Land Commissioner :*

DEAR SIR: I have imperfectly appended my answer to a few of your questions. The waters of the Truckee River flow to waste from October to May, about six months of the year, at least 75 per cent. of the annual flow. Of the balance not more than one-half is utilized.

From the inclosed printed slip you will gather my idea as to the food-producing resources of this State. They lie more in the waters of irrigation than in the land. A monopoly of the waters gobbles up everything in food-producing resources, makes farmer-boys tramps, reduces good men to desperate want. The conformation of our country is such that the Truckee River can be turned into dry basins and held from October to May and then drawn for irrigation. Let the waters of irrigation of the Truckee be appropriated to the State. Let the State have one-half million acres arable desert lands, proceeds of sales to be applied to constructing irrigation canals, State to maintain canals; let no man have more than 40 acres of irrigable land; that after five years' occupation and cultivation furnish him water at, say, \$1 per acre per annum; proceeds to support State government; then will the waste water of the Truckee make the desert a happy and prosperous home.

For short,

B. F. LEETE.

JOINT RESOLUTION petitioning Congress to donate 500,000 acres of arable desert land to the State of Nevada for internal improvements, the proceeds of such land to be applied to constructing irrigation canals for the purpose of developing the food-producing resources of the State, because—

First. As a people we are buying our food from neighboring States.

Second. The permanent wealth and prosperity of the State lies in the development of its food-producing resources.

Third. The food-producing resources of this State lie in arable desert lands and the waters of irrigation.

Fourth. The arable desert lands in their desert state are valueless.

Fifth. Such lands can only be made productive and valuable by irrigation.

Sixth. That a holding or controlling of the waters of irrigation controls the food-producing resources of the State, therefore the waters of irrigation should be appropriated to and vested in the State, the State to construct canals and deliver the waters for irrigation, at such rates as may be fixed by the people from time to time, forever, thereby placing the production of food to his own use and benefit within the reach of laboring men, and for this State within this State: Therefore, be it

*Resolved by the senate (the assembly concurring),* That our Senators and Representatives in Congress be requested to lay this subject before Congress, to the end that a grant of arable desert land of at least 500,000 acres shall be had to this State, the proceeds to be applied to internal improvements in the construction of irrigation canals for

developing the food-producing resources of the State. Such land to be selected from any land eligibly situated for irrigation along the line of location of such canals, and within a belt of ten miles in width on either side thereof: *Provided*, That not more than 80 acres shall be conveyed by the State to any one citizen or person after actual residence and cultivation for a period of five years.

*Testimony of Thomas J. Read, Eureka, Nev.*

Thomas J. Read, Eureka, Nev. Been engaged in surveying mines seventeen years: since the passage of the mineral laws in 1866.

That for two years there was virtually a vacancy in the land office, and I had to look after the office in order to get my mineral work through.

I have got out or in progress more than 300 patents for mining claims, about one-thirteenth of all taken out in the United States.

The expense to obtain a patent for a mine 1,500 by 600 feet is \$300; that includes land, advertising, and all expenses.

I have been over the entire land district and know it.

Would call the entire State of Nevada a mining and grazing State; agriculture is a mere incident; I know the district and State thoroughly.

The State is a succession of mountain ranges running north and south, with valleys in between.

The tall mountains, the Sierra Nevadas, are covered with timber fit for lumber, and the rest of the mountain ranges are covered with small timber, nut-pine, &c., used for fuel; the water-courses are small in number and limited in supply.

The rain and snow fall of the whole State is from 6 to 8 inches.

There has been no change in the rain or snow fall since I have been in this State.

I would classify the lands in Nevada by calling them timber, mineral, arid, and irrigable.

I would let this classification be done by the deputy surveyors in their field-notes and maps.

When townships are surveyed on streams or water-courses; where irrigation is practicable by the lay of the land, the deputy surveyor by instrument should ascertain the altitude, and that altitude should be carried out on all maps in the range of these water-courses; also should show by contour lines or otherwise the slope of the land whether it could be irrigated or not. This map when returned to the district land office would be the basis for the sale of the lands, whether irrigable or arid.

The rainfall in Nevada commences about September 10 and lasts till May; this includes snows.

No part of the State can be cultivated without irrigation.

Most all the water in the State has been taken up.

The laws of the State and the decisions of the supreme court of the State give the water to the first appropriator to do as he pleases with it; provided he takes it out of the stream and uses it, he can change it from one piece of land to another and he must turn the excess back in the stream.

I have never known a valuable water-right but what there has been a conflict about it, generally costing more than the water is worth.

One acre out of 100 is agricultural by irrigation; 90 acres out of 100 pasturage; and 9 timber; the mineral lands are included in the timber and pasture lands.

A pasture homestead should be allowed on the arid lands for the purpose of raising cattle, say of 3,000 acres.

These arid lands should be surveyed and sold at not exceeding 10 cents an acre, and in unlimited quantities, protecting the present occupants of the ranges with their herds of sheep and cattle.

About thirty to forty acres are required to keep a beef in this land district.

The increase of a herd of a hundred cattle would keep a family.

The grasses in this State are bunch grass (which is the principal pasturage grass) and the white sage, which is made fit for use for the cattle by the frosts.

The grasses on the range have decreased, because the cattle and sheep eat it, roots, stock, seed, and all. This could be obviated if cattle men had the ownership or assured possession of their ranges. They could fence the ranges, either by fence or herders, and thus retain control of the range necessary for their band of cattle and keep interlopers off, and they could move their herds from place to place on the range, and thus secure a succession of grasses, giving it time to seed and reproduce.

Sheep and cattle will not graze on the same lands.

I believe in the retention of the rectangular system of surveys of the public lands with the addition of, first, more permanency in corners and stakes, as in a long experience as a civil engineer I have frequently been called upon by settlers to rerun old survey lines, so that they could ascertain their lands, and have generally found the

stakes and corners obliterated because of the rotting down of the stakes and the tearing down of the monuments, and even the best deputy surveyor, under the present system of marking the surveys, can't make his work hold more than five years.

The government should provide iron or other metal permanent stakes or posts, say at the intersection of every four townships; and I suggest the improvement of the present system of surveying by the addition of triangulation, so that isolated tracts of settlement or other lands can be reached by the surveys without the great expense, as at present, of surveying the exteriors and subdivisions of many townships.

I suggest that the timber lands of the United States be let alone as they are now—I mean in the State of Nevada—because the amount of timber is so small as against the total area that it would not pay to survey it. When the timber in this district is cut clear off it comes again, but very slowly. The mahogany is one hundred and fifty years getting its maturity. It is a dwarf and does not average over 15 feet in height and about 8 inches in diameter. It is best for fire-wood. The juniper is not fit for charcoal and is only fit for fuel. It gets its maturity in about forty years. It is a scrub, seldom reaching more than 15 or 20 feet. The nut-pine is the most valuable tree of any outside of the timber on the Sierra Nevada, and grows on most of the mountain ranges. It is the most valuable for charcoal, and reaches its maturity at from forty to fifty years, and grows to the height of 20 to 25 feet. Charcoal is an indispensable element in smelting in this State. The forests of the trees above set out, unlike the pine forests of the Sierra Nevadas, grow at wide intervals. On one side of a mountain range you find a forest where the snow lies, say the north side, and then you go six or eight miles on the other side and find none. My observation is that the cutting off of these forests does not affect the rainfall of the State, not an inch. The mountains about the Humboldt which furnish the snow and rain for that stream are bald of timber.

I would place the jurisdiction over the public timber lands in the hands of the United States district land officers, who should be authorized by law to issue license to responsible persons to cut and use timber on the public lands, this for the purpose of protection, and providing that the smaller growth of timber should not be cut. The reason why I do not favor the sale of these timber lands is that every dollar added to the cost of smelting by reason of charges of wood for charcoal adds to the already great cost of smelting our ores of gold, silver, and lead, and would prevent the smelting of a vast amount of ores which are now worked at a very small and close profit. There are no fires of any moment in this district.

Persons just build a brush fence to mark the lines of a land claim for timber. This is respected under the local usages and customs.

I would suggest that it be left to the miners of a locality to adopt, as the formation shall warrant, either a square location with end and side lines or the location permitted under the present act of Congress, which I would reduce to 100 feet on each side of the center of the lode.

No official survey of a lode claim should be filed which overlaps on the surface.

The croppings I understand to be the top or apex of a vein or lode. The top or apex, the course, and angle or direction of the dip cannot be determined in the early workings of a vein or lode.

The intended rights of a discoverer are properly defined and protected by the locating of a claim in many cases under the existing laws, for the reason that if the ledge crops out for the 1,500 feet the miner can mark his monuments so as to give his side lines accurately, and in blind ledges they seldom run for any great distance, and are generally pockets, so he is not much injured by the blind feature.

The ledge on which is the Eureka and Richmond in this mining district is, say, in some places, 700 feet. The local law of this mining district permits the taking of 100 feet on either side of the ledge, so that in this case neither the Eureka nor Richmond would have been injured, because they would have had the whole ledge in width and 100 feet on either side.

I don't think it would be policy to change the present laws in regard to lineal locations of lode claims to fit the few cases where the ledge will cross the side lines and leave the man's ground after he has staked it. When a locator locates a lode claim, allow him to get a patent without the expenditure of \$500 for work, for the reason that by the time he has expended his \$500, if he has developed a good mine, he has simply opened up a way for jumpers and blackmailers. I have never known a valuable mine but what was burdened with serious and disastrous litigation.

The present mining laws of the United States are very good, and only need a few practicable additions and amendments.

I had experience in forming mining districts in Palmyra and in Washington districts in 1860 and 1863.

In organizing a local mining district the men who are present, sometimes two or twenty as the case may be, and need not be practical miners, hold a meeting, elect a president and secretary, adopt mining laws, setting out the boundaries of the district, elect a recorder and fix his fees. The recorder keeps a book in which is kept the record

of the meetings, which is the basis of the title to width and length of a lode. This book remains in his possession; he is under no bond, and the record could be altered by him at pleasure. The notice which the miner gives the recorder is a copy of the one posted on the claim, and the miner often floats this notice about until he gets what suits him. I have known these records to be altered by the recorders, and in some cases the books lost, burned, and destroyed. I knew this to happen in Belmont and Bullion districts in this State. There is no security against frauds of this kind. In view of all this I believe that all mining-district laws, customs, and records could advantageously be abolished, and the whole initiation of record title as to future locations be placed exclusively with United States district land officers, making provision for convenience of the miners at isolated places a great distance from the office.

The limitation as to possessory title under the mineral laws should not be enacted into a forfeiture; in many cases miners are too poor to pay for their claims and hold their possessory titles by doing work upon them as now provided by law.

I have cases of mining patents pending before the department at Washington for more than nine years. The average time in getting a mineral patent from this State is about three years. If we desire to hurry them by retaining an attorney in Washington and paying a large fee, we can get patents in from thirty to sixty days. This is all wrong; patents should be issued in their turn, and promptly, and no preference given either to attorney or principal.

---

*Testimony of A. D. Rock, surveyor, Eureka, Nev.*

1. A. D. Rock, surveyor, Eureka, Nev.
2. Thirteen years.
3. By possession only.
4. Only by observation and surveying
5. No answer.

**TIMBER.**

1. There is but little, and mostly slow growth—pison and cedar.
2. None.
3. I would sell in small quantities to citizens by entry, after local surveys.
4. I would not; it would not pay for sectionizing.
5. No growth from old stumps; it would take fifty years.
6. One must have some timber.
7. To settle the country.
8. Is his by right of possession.
9. I think they would, with restrictions; not to incur expense in surveying.

**LODE CLAIMS.**

The local rules and acts of Congress are sufficient as now found. Supreme court decisions are generally about right, and generally satisfactory.

---

*Testimony of David Van Lennep, surveyor, Winnemucca, Nev.*

The questions to which the following answers are given will be found on sheet facing page 1.

**Answers to questions submitted by the Public Land Commission.**

1. David Van Lennep, Winnemucca, Nev., surveyor and assayer, United States deputy surveyor, Humboldt County county surveyor.
2. Eleven years.
3. Acquired title to public lands of the United States for other parties under the desert-land act.
4. By being in contact with parties acquiring the public land.
5. One difficulty presented in this county (it is very extensive) is the expense and loss of time of going to Winnemucca and Carson to make affidavits before the proper officers; also the necessity generally of employing legal advice to draw papers properly. I do not know of any remedy.
7. The county is cut by mountain ranges, almost all running nearly north and south, between which are valleys from two to ten miles wide, and through the latter the main

water courses flow or make sinks. These courses or rivers are fed partly by springs from the mountains, more largely by rains, but mainly by snow melting on the mountains. On account of the scarcity of water and the necessity of irrigation to obtain any kind of crop only a small portion of the land is agricultural, properly speaking; a larger proportion is pastoral. Grass is abundant on the hills and mountains; also in the bottom lands in ordinary seasons; at present, after two dry seasons, grass is very scarce everywhere; it is best on the mountains. There is also much mineral land, so called; a very small quantity of timber land. The timber is only fit for fuel and farm purposes, such as fences and out-houses; it is not fit for lumber.

8. Land that can be irrigated should be classified *agricultural*, provided the soil is rich and does not contain too much soluble salts, such as common salt, alkali, borax, &c.; *pastoral*, when producing natural grass and brush fit for cattle, provided there is no valuable mineral found thereon, and provided the sale as pastoral would only mean the surface, irrespective of mineral that might be discovered after the sale; *mineral*, to be only such lands as have mineral deposits or ledges bearing valuable minerals; *saline*, having a deposit of alkali, common salt, &c., &c., on the surface; these are considered worthless unless they have enough salts to gather.

9. Agricultural lands to be acquired in such subdivisions and quantities allowed now, with privilege to acquire pastoral lands besides in larger quantities but in same subdivisions now in use, with the option to take land in a different place or away from the agricultural land; *mineral* as at present; *saline* only when the salt is found in large enough quantities to gather, to be taken as placers.

10. By the above suggestions it is believed that more land will be acquired by actual settlers, at the same time making the acquirement of land as simple and economic to settlers as possible; increase the fall of rain and snow to about double the present rate and there will be a demand for land and homestead.

#### AGRICULTURE.

1. Climate good; rainfall scarce; length of season short, having frost almost every month in the year; snowfall in winter in the valleys moderate; more abundant on the mountains; drifts in the deep ravines, and when heavy gives a good supply of water for irrigation.

2. From April to October rain, or snow that melts away fast, falls in small quantities. The heavy snowfalls are liable to come in December, January, February, or March; best when they come in December and January, as the snow by freezing is more likely to last later as a supply of water for irrigation. The thawing of snow on the mountains comes mostly when needed, but frequently in too great abundance in spring and too little in summer.

7. The general supply comes from snow on the mountains. Melting of snow swells and overflows at times the rivers, such as the Humboldt, Little Humboldt, and Quin's Rivers; also creeks, such as Martin, Cottonwood, Buena Vista, Kayoti, and many others. By the end of August, and sometimes before that date, both rivers and creeks are dry one to four miles after leaving foot-hills; many do not reach the valleys. The Humboldt River is an exception. Springs are found in different localities; each irrigate a very limited amount of land. Most of the little springs in the mountains, in August, September, and October, run only a few yards from their origin.

4. Irrigation is comparatively in its infancy in the county, although settled for about eighteen years. Generally too much water is used and wasted. There is no idea or impression that irrigation impoverishes the land. Much land in this county has given rich crops of grains (cereals), year after year. Manure is not used, except for vegetables, &c. I do not know that crops are raised higher than a thousand to two thousand feet above the valleys. In cañons and small ravines between hills, these places are the warmest, and therefore better fitted for vegetables and fruit trees.

9. Generally all surplus water is wasted, as no care has thus far been taken about economizing it, and if a neighbor does not need the waste water, nobody attends to it. No regulations are in existence in the State or county about the use of water or waste water.

10. Water available for irrigation is all taken up; usually by the laws of the State.

11. The great scarcity of water, occasioned by drought the last two years, has been the cause of several lawsuits, the last and present year, in Paradise Valley, Big Meadows, and Kayoti Creek, near Unionville.

13. Not practicable. A settler wants always a small portion of agricultural land near his house, in a cañon, along a spring, &c., which could not be called pastoral.

14. I think it is to be only partially limited, to prevent speculation on one hand, and on the other to enable settlers to have enough land for their stock.

18. The growth has diminished.

19. Partially, mostly in valleys.

21. Rivers, creeks, and springs, both in valleys and mountains.

23. Has diminished.

24. They do to a certain extent, but sheep destroy the feed and render it unsuitable for cattle.

27. The lack of water for irrigation being the principal cause in the way of increasing the agricultural industry of this county, any means employed to increase water would increase also the sale of land. Whether this could be effected by the inundation of the Colorado Desert, forming an inland sea or lake, and thus increasing the humidity of the atmosphere of this county; or, by a more direct way, by grants of land at a reduced price for every success in bringing water to the surface by artesian wells, would forward that end very greatly. These grants might, to advantage, last the time. It is probable that success would excite too much speculation.

28. In places much trouble is found, although few are entirely obliterated. This occurrence is in very sandy soil, which drifts by wind. Posts and mounds in the rear of cattle are apt to be destroyed. The cattle scratch themselves on the posts and break them; they also tramp down the mound. At times, in a new and unsettled country like this, ignorant and malicious men do not respect or take care of survey-posts around their own property. Generally, corner posts near an old Indian camp are destroyed: the mound is usually found.

#### TIMBER.

4. There is no timber land (properly so-called) in this county. On some hills scrubby cedars or junipers; on higher ranges some mountain mahogany—all in limited quantities; in cañons along the creeks, cottonwood, quaking asp, and willows. In the southern part of the county nut-pines, rather small, are found on a range of mountains, hardly good enough for lumber. All the trees above stated are used for firewood and farm purposes as timber.

2. No timber planted. Trees planted about houses and gardens are poplars, cottonwood, locusts, and fruit trees—thus far used more for ornament and shade.

#### LODE CLAIMS.

1. As superintendent of mines in this county; surveying mine claims for patents and the interior of mines. Have been called as expert in mine litigations.

2. The mining law, as interpreted by the Commissioner, is complicated and difficult to comply with. It causes great unnecessary expenses in the obtaining of a patent. It should be so amended as to give a clear and simple interpretation. There should be a first and preliminary location when a ledge is first found, to allow time to locate in a permanent manner, after determining the course. The final location should be made by competent persons. It should also require the length of claim to be in the general direction of course of ledge; this to be found by taking a level as near as possible on the course. Locator should have the privilege of locating over 300 feet width from center of ledge in case the same outcrops beyond 300 feet from the center line of ledge. This provision to be only with intention to cover the outcrops by location, and prevent outsiders from taking advantage of the circumstance. The claimants of a claim should have the privilege to act by attorneys in certifying to papers required and necessary in obtaining a patent.

3. I have not had any case of that kind in my practice as surveyor. I should think it better to have such cases decided by courts of justice before filing.

4. The top or apex is the uppermost part of the ledge between the two walls, although these may be missing. Most generally the apex or top can, but the course and dip cannot be determined. Blind ledges are those whose top or apex are under solid ground, and which have not thus far been exposed to the surface.

5. They are not.

6. The law is usually complied with as near as possible with regard to these points. In case of a lawsuit advantage is taken of any weak point.

9. Do not know any wider than 300 feet from center of ledge; they are sometimes wider than district regulations allow. In the latter case the local laws are apt to be modified.

10. This occurs in outcrops of a ledge whose course is across a hill and dipping in the same at a small degree from the horizontal. The outcrops are frequently located and not the course of the ledge. If located by the course the outcrops would be found outside of the parallelogram of location.

11. To the disadvantage.

12. B can put A to cost and inconvenience. I do not know now any case to the point.

13. Such cases are of frequent occurrence. Blackmailing is not confined to the portion of the dip which has passed beyond the exterior lines of the surface tract. It would be too much labor or expense to try to do that with vertical veins.

14. I think it possible and also better than a contrary provision, as the original discoverer, in the last case, may derive but very little benefit from his discovery if his ledge is dipping at a small degree from horizontal, while an outsider, in such a case, would have the lion's share.

16. After a ledge is found, as soon as the discoverer gets an idea of the course, dip, and value of his ledge, say in two or three days (but if an excitement is existing in the district he is apt to locate immediately), he places a notice and monument to start from, and very indefinitely states the course of claim located. A copy of the location he takes to the district recorder, who records it and measures the claim a few days later, according to the laws of the district, placing the corner monuments, as stated by location, as near as he can by a pocket-compass, or, in absence of it, by guess-work. This proceeding is subject to many imperfections, and when the location turns out valuable ground the want of conforming to the laws of the United States creates much trouble, inconvenience, blackmailing, and resulting in very serious litigations, and not unfrequently the loss of the claim to the original discoverer.

17. It cannot be amended, if other claims have been located along the same, except by consent of subsequent locators.

19. I think, with precautionary measures, mining district laws could be advantageously abolished as to future locations, provided the United States land offices for mining claims be placed in more centers than at present for public lands.

22. Ought to be limitation—say five or six years.

#### PLACER CLAIMS.

1. Small gulch placer claims exist in this county ; thus far no effort has been made to procure title for them.

#### *Testimony of B. C. Whitman, of Virginia City, Nev.*

B. C. WHITMAN, of Virginia City, Nev., testified at San Francisco, Cal., October 11, 1879, as follows :

I have been familiar with the mining laws of the United States for fifteen years as an attorney, confining my business almost entirely to the mining corporations. I think the present mode of initiating titles with the mining recorders is probably satisfactory, but the method that is primarily used in mining districts is very uncertain and unreliable. At the present time mining records are of record in the county recorder's office, and are just like any other titles. I speak of Nevada only, as I do not know anything about any other State. The original notices are drawn by ignorant prospectors, and frequently by persons who find it somewhat difficult to write the English language, and indefiniteness of description arises on account of their ignorance. At the present time we are acting under no especial mining district laws, but the mining notices are filed as prescribed by the laws of the United States, and are filed in the county recorders' offices and there recorded. The original locations of the Comstock were filed in separate mining districts; one in Gold Hill, and another in another place. All these notices have been transcribed, and the originals have been held in the office of the county recorders. These were originally drawn by the claimants themselves, with a great indefiniteness of description and date. You would see "recorded this day," and there would be no date. It was posted on the claim and filed with the local mining recorder. There was no security for the integrity of the records in the hands of the mining recorder. Those records will show the very great carelessness with which the business was done. For instance, in the notice of the Miller grant, as it is called, at least one-third of the names that were originally written upon the notice have been scratched out and other names substituted; properly enough, because the names of most of his friends were written there, and as those friends did not come to time he would scratch out their names and insert others. He used the names of his friends to take up a number of additional feet.

The Miller claim as originally located was 3,600 feet. The district law then allowed 1,500 feet for each locator, and it in terms restricted a man to about so much, but in fact a man located as many feet as he pleased by using the names of other parties, and often without their previous knowledge, and then he would go to them and have them deed to him what he had located for them. Locations are often made in that way, and then deeds taken by the original locator from the others. Locations are now ordinarily made in the name of one person, because he can now take 1,500 feet.

The county recorder is under the same responsibility for copying mining titles as he is for copying all other records. He is elected by the people and gives bonds to the State, and is the custodian of the records of the county. A certified copy of his record is the basis of title. If he sends a false certificate he could be punished under the statutory law for falsifying his records, because it is under the State law that he is made the custodian of those records. The mining law allows this notice to be recorded, and if an error, intentional or otherwise, were committed in the certified copy, I do not know whether that would make him amenable under State law or not. I think the initiation of the law ought to be in the United States in the first

instance. As long as they keep control of this land they should have control of its disposition of it from the beginning to the end.

The present system is anomalous and burdensome. The location and size of the claim should be regulated by the United States. If the United States has superior control, it should either exercise it or give up the control of the land. I think it is advisable to require a miner to commence with an official survey wherever it can be done. I think the law ought to prescribe that the survey should be made within a certain time after the location has been made. I do not think it would be harmful, because the surveyor generally accompanies the prospector or follows him after him. He follows there for custom. It is seldom, if ever, the case that a claim cannot have his claim surveyed within thirty days after his discovery. The difficulties would be obviated by allowing him, in proper form, to locate his claim upon the surface and posting his notice thereon, and then allow him to file his notice with the surveyor, permitting him to ask for a survey, and that survey dating from the date of his application. I think sixty days at the outside would be sufficient time in which to have him apply for a survey. My personal opinion is that no surveyor ought to be allowed to make a survey over an overlapping claim. It is not infrequently the case that a claim which has been located, so far as you can gather from the notice of the discovery, and so far as you can gather from the oral proof, runs in a northerly or southerly direction, but when the United States surveyor is called upon to locate the claim has swung around into an easterly and westerly direction.

It is very difficult to see the true direction of a claim, because parol testimony is becoming extinct in old mining districts. It is very expensive, too, for witnesses know their importance and charge very high fees for testifying.

There is a great deal of trouble arising from claims being swung around and their direction changed, and the only way of overcoming it is by the original location and the testimony of the work which the parties have done.

Parol proof in a mining camp is not very difficult to obtain. The witnesses in that district would stand very favorably, because they have testified often, and we can tell pretty well whether they are telling the truth or not.

Question. Do you think it well to require the discovery of a lode before location is admitted?—Answer. No, sir; I do not understand the object of such a provision in the law. Sometimes valuable mines after they have been found are blind lodes. Croppings on the surface of a country are false indications in the value of lodes. There are many transformations which affect the croppings, but do not affect the lode underneath. I think if a man has made his location and is willing to go on and work it, that he should be entitled to whatever is within his lines. I think the government should provide a different style of location from what they have now. My theory is that a better system of location should be adopted for every mining region, but I know nothing about the expense that would attend it. The Comstock is a square location with vertical side lines. The advantages of that location would be, in the first place, to prevent a great deal of litigation that follows when two or more ledges unite, and there is no division of them afterward. Nearly all our mining litigation arises from this cause, and experts are very apt to take sanguine views of the ledges of the respective patrons. They become interested in the case, and I have known juries to decide upon a case where the ledge was no thicker than a knife blade. I have also known them to reject where the lode was very thick. The Comstock ledge is now looked upon as the centering of deposits from all the croppings from a mile around.

Q. Is not a certain line of claims recognized as being the Comstock lode, and is there not in front of those recognized as being on the lode a multiplicity of other locations?—A. Yes, sir; and the result is that parties having no lodes on their own grounds strike the dip of those other lodes, and set up adverse claims. It is possible under the present law when a man has located a valuable lode for any other party to sink another for the purpose of striking the dip of that lode. In such a case as that difficulties must necessarily occur. There is that kind of trouble now in the Comstock district. The Chollar Potosi had the Custer location; the Julia has the patent for its grant, and has extensive works. The land office refused to entertain a protest of the Chollar Company, saying so far as could be ascertained the Julia lode was a distinct body of ore, but if the Chollar Company ever in their workings proved the connection between the two lodes, then it would pass to the Chollar and its location, so that if it is proved to be the Custer lode, the Julia patent would be voided. In our State courts such cases are frequently passed upon by experts; in some form or other by the testimony of experts as to the theory of location or otherwise. They must satisfy the jury of the connection between those two locations. It is only a question between a practical location and a theoretical location.

Q. What size would you have a square location?—A. I think the square location should be 1,500 feet square; that would be a fair allowance. They give now 100 feet in length, with a surface ground of 300 feet on each side of the lode. I think they give a man 1,500 feet square he will have a mine if there are any mines in that district; but I would have all local laws conform to United States laws. There

be no interference between the two. I think the square location would have no injurious effect upon deep mining; on the contrary, I think it would improve it, have a good effect, always provided that the United States survey and fix the monuments. A man could go in there then feeling that he owned that piece of ground, and I think every prospector would be willing to avail himself of that and go to work on that supposition. The history so far as I know of every mine and mining company is continued litigation and expense by adverse locations. With a square location there could be no litigation. Mining men would be more willing to invest in a square location than they would in what we call ledge locations.

Q. Would parties be willing to develop the mines, with a possibility of getting outside of their location?—A. I think parties would undertake to mine with the possibility of working outside their lodes. They would at least have a right to the ore deposit as it is, any way. I have no fixed opinion about the size of a mine; it might be made larger. Of course I understand that that system of square location would not be satisfactory for a ledge like the Comstock lode, or a lode of that width; but it is impossible to have a sliding scale of location. You must have some absolute rule, and I am inclined to think that an absolute rule of square location would be more satisfactory than any other. The locators on the Comstock lode have been obliged to litigate, and they will have to go on litigating. That was the great question in the celebrated Eureka case. They claimed that they were on a great lode, and, anywhere within the end lines, had a right to follow that lode. They defined the mining word "lode," accepting the miners' idea of it. There were several patents in that case, and they didn't settle anything at all. The patent for the square location settles something absolutely. In the event of the square location being made, my idea is that a party shall have from the surface down to the nethermost depths. If he finds a deposit of ore he is fortunate; if he does not find it he is in bad luck; but he should not go outside of his lines. Within his end and side lines he is entitled to everything. Each man would then understand just what he has got. Of course there would be a great deal of digging around underneath, but that would be simply a matter of trespassing. I would allow another party to locate on the next claim, and to go down to any depth to find a dip of the ore if he wanted to. I am not a practical miner, but I have talked with many men who are, and that is their idea about it.

In mining districts you frequently will find small lodes running parallel to each other, and I think a man should have everything he finds inside his location. They take the whole district now in Bodie. There are supposed to be half a dozen lodes. No one of these lodes is wide enough to warrant anybody in exploring it. Then from the dip of these lodes it appears that some of them may combine, so that they have been obliged, in order to protect themselves, to locate half a dozen lodes for the purpose of getting one mine, and, as they are distinct ledges and one man located them, this causes confusion of title. There was a case in one of the Nevada districts where they had located two or three different claims. An adverse location having been made there, that matter came up for decision and a very important question arose: whether the work done upon one of these claims applied to all of them; the court holding that it did, because it was all taken up to make one mine. The adverse claimants argued that one of these locations had been abandoned, because the legal amount of work had not been done upon it. It seems to me if the square location had been applied to the Comstock lode it would have been better. In the event of the square-location system being adopted, you would have to repeal the tunnel law. I do not see but that, under the present law, when a party locates a tunnel another party has a perfect right to go and locate a claim of 1,500 feet over the tunnel, but before the tunnel discovers anything; and I understand the rule of the Land Office to be this—that the party running the tunnel is entitled to locate 1,500 feet upon any ledge that he may discover in his developing, but the width of the location shall not exceed that of his tunnel, if nobody subsequent to his location gets outside of the lines of his tunnel and makes a previous discovery of a "blind lode."

Q. You say that they may make a previous discovery; that is, make this discovery on the surface before he has made one underneath?—A. What I mean is this: A starts a tunnel; that tunnel is ten feet wide, and he is prosecuting work on the tunnel. B comes here and sinks a shaft and finds a lode and locates it, and A strikes the same lode in his development; then B takes the lode. As most of the tunnels are very expensive, that renders the tunnel law practically ineffective for the purpose of prospecting. There are a great many instances of this at Bodie. I have never known anybody to discover anything, except in one or two cases where they claim to have discovered lodes by means of tunnels; I never knew any lodes actually worked that were discovered by tunnels except in those instances at Bodie. The tunnelers claim to have discovered a valuable lode to which there is no outcrop and upon which they have located a claim of fifteen hundred feet, to which they are entitled. In regard to the two or three other so-called discoveries, there is more or less litigation. In the event of the square location there would be no necessity for the tunnels; the square location is supposed to give a man just what there is in his claim, and nobody would be allowed to go in

on him. I think the tunnel law has been an advantageous law in California for the purpose of discovering old river-beds, but if a person had a square location he would have a right to run a tunnel in that, if that were the easiest way to get to his ore, if he did not interfere with anybody else's rights. There would be no need for the tunnel law to enable him to take up a mineral claim.

Q. Suppose the law provided for square location and the title initiated in the form you have indicated, would you require the proving up on the title within a certain length of time?—A. I think the limit of time within which to prove up should be increased, and I think the party should be compelled to get the title from the government, and all merely possessory titles should be extinguished. One year, I should think, is sufficient time for proving up, and at the expiration of that time a man should be merely required to establish that he had made his location in accordance with the provisions of the statute, and that he had done the work upon the claim as required by law. Under the present law there is no proving other than the location of the party and certificate of the deputy surveyor; and while these gentlemen are generally very accurate about it, of course there are cases where they are mistaken.

Q. Would you have the law specify what the character of the improvements should be?—A. I think not, sir, except that the character of the improvements should be actual work or actual expenditure conducing to the development of the mine. I believe that the courts have decided that buying machinery is an expenditure, and I do not see why that should not be accepted as such.

All over this country claims have been abandoned absolutely and nothing done upon them for years. Eventually some enterprising person comes in and makes some discovery, and then the old locator comes back, and they can almost always succeed in getting a case sufficiently strong to bring about a compromise. Now, if a party is compelled within one year to make his application for title, and a strict forfeiture is provided for non-compliance with the law, it would do more to improve the country than anything else. That forfeiture should be merely a cancellation of all rights, and abandonment should be conclusive proof. The law should provide for the extinguishment of possessory rights of all parties to the land. The old possessory claims should be placed upon the same footing, so that in course of time there would be some common law in operation.

I think the mill-site privilege should be continued, because the square location might not be a very convenient location for the mill-site. I do not think that there is any necessity for a party to make proof that he has got a mill or intends putting up one. Let him make his application, and then the government might agree to give him an absolute title upon proof that he had commenced and progressed to a certain extent with the work.

I do not know that any mill-sites have been taken up for the timber or other value to be obtained from them; that is, from the land. All the saw-mill sites I have known to be taken up have been for actual use. I do not think there is any necessity for a law restricting the distance of mill-sites from the mines. It might depend upon many contingencies as to where the mill-sites should be put. For mines that are down to the Carson River they used a mill down on the Washoe; it must have been 50 miles from the mill to the mine in that day. Of course no man is going to claim a mill in any district that is practically too far off from his mine. In Eastern Nevada there are places where they haul 30 or 40 miles to the mill, and it has always been a question whether it was cheaper to haul ore to the mill or water to the mine.

Q. In the event of mill-sites being continued, should the restriction of the non-mineral land be continued?—A. That is a question which requires a good deal of thought. I should be inclined to think that there is no necessity for any of those provisions in regard to the classes of mineral or non-mineral land. Practically, if the simple provision that is placed upon each patent is carried out, I think surface locations need not conflict with mining locations. There is a great deal of surface land that is in neither class, since part of it is mineral and part non-mineral land. It should be used for surface purposes. I do not see any particular reason for drawing a distinction between mineral and non-mineral in districting. There have been a few instances where mines have interfered with the possession of the surface. There was one in the case of the Chollar mine. Their location was prior to the location made by parties on the surface, and the mine coming up near the surface, the occupant of the land was ordered to move; but he did not do so, and his store dropped down into the depths one night. This is the only case I have known where the rights conflicted.

Q. Would you reserve the subterranean rights?—A. The sale of one thing should not include another; the sale of the surface should not include subterranean rights. I think if a man bought the timber land, and if he wanted to make a mineral location he ought to be compelled to make another location. As the case stands, I see no reason why the two should go together; why the surface rights and subterranean rights should not be sold separately.

Q. Should not the publication of the objection provided by law to the mineral application be conclusive upon the government as to the right of the applicant?—A.

The present system is exceedingly onerous to the applicant. In the first place, they require an abstract of title; that costs sometimes thousands of dollars to obtain, besides taking a great deal of unnecessary time. That abstract of title may, under the present system of the Land Office, be of some use; but there are other cases where it is not of any use; that is, in the case of contested patents; he has to furnish an abstract of title that can never be of any use, and after this abstract is furnished the office frequently refers the whole thing to the State courts, and the State courts decide upon the title between the two. The proof must be made over again. This lies in the archives of the Land Office, and I cannot see that it is of any use. In many cases it is absolutely impossible to get an abstract. In early days they made that transfer by putting a party in place on the ground. The courts have held that to be as good a title as if a man had a paper title. It is frequently the case that when abstracts come up they are necessarily incomplete, because it is impossible to make them complete, and it seems to me that the application is always necessarily between the Government of the United States and the applicant, and it should be conclusive as to the intention of the applicant. He is obliged to go into the State court, and the judgment of that court is conclusive in the Land Office. The Land Office looks into it in the first place merely to see that it is a *prima-facie* case.

Q. How would such a provision as that of section 15 of the act of March 3, 1851, be?—A. I think some provision of that kind would be effective.

Q. Do you think that it would be wise to invest the executive officers with a larger jurisdiction as to the *prima-facie* validity of the adverse claim than they now enjoy?—A. A man makes an objection under oath, and I think that is enough. I am inclined to think that is as well as we could have it. He makes his objection under oath, and he has to file his abstract of title with his objection. I do not see any reason for filing that abstract of title. My idea is that if he makes his proper sworn averment that should be sufficient, in view of the fact that he has, after a certain time, to prosecute that averment. If he does not prosecute that averment with reasonable diligence, I think this matter should be left with the courts where the case is tried. I think it is right to leave it there for the action of the court if it is not prosecuted with reasonable diligence, and I do not think any other person ought to be allowed to interfere with it. It is hard to say what reasonable diligence is, and the court is the proper tribunal to decide it.

Q. In your judgment, should the conveying of mineral transfers be with the executive officers the same as with all other land cases?—A. I cannot see any reason for making a distinction. I never could understand why they should inject this question of courts into a proceeding which after all does not involve any questions of law, and which is an administrative proceeding. They are simply questions of facts, to which there can be very little objection under proper statutes. Taking them up to a court ends to additional expense and delay without producing any good or economical results. The question comes up about location, and one court will hold parties to a strict compliance with the statutes, while another court will hold that anything which indicates the desire of the party to make a location is substantial compliance. If these matters were before the Land Office, there would be a ruling, and there could not be a very great conflict of opinion, because it ultimately comes before the supreme power of the Land Office. I think it would be a much better system and a saving of expense to have the whole question from the inception of title to the end go directly through the Land Office, as all other land cases do, and that the patent, when issued, should be conclusive upon the question of fact. Of course, it would also cover many questions of law. The patent should show that the applicant had done everything he was required to do in order to get a patent title from the United States.

There is another thing; it has been decided by the Commissioner of the General Land Office that under the present statute a man may make more than one location upon the same lode. It was decided in reference to the iron mines of Colorado. That decision has been made, but whether it is to be a decision without contest I do not know; but it seems to me that if that statute is altered, it should exclude the party from making more than one location upon a lode. It may be that this is a proper decision under the present language of the statute, and I think that result ought to be prevented by putting in an enactive word. I would give a party but one right of pre-emption in mining cases, the same as is now done in agricultural land cases. The government gives a party a certain right, and it does not intend that he should hog everything. My recollection is that that decision was made four years ago. The decision goes on to say that the statutes of the United States do not prohibit a person from making more than one location upon the same lode; therefore, if it does not prohibit him from making more than one, he may make fifty if he may make more than one.

Q. Do you not think that a more perfect system of surveying of mineral claims could be adopted?—A. I cannot answer that; I am not sufficiently a practical surveyor.

Q. Does the present system lead to great uncertainty?—A. It would ultimately, but it does not now because live witnesses are at hand. I think it would be well if the

mines could be located with absolute certainty. Frequently the second owner cannot find the corners, even if he went to the surveyor who first laid out the ground; and the chances are that the present surveyor would miss it a little, and in case of controversy it would cause trouble.

Q. Suppose that a party takes up a square location with a dip running off in a certain direction, and then that dip turns and runs out the other way; what would be the situation?—A. The situation would be pretty bad, but I do not think it would be any worse than the situation is now. I think the individual miner and prospector would be safer. He might occasionally lose his lode, but I think the individual loss would be overbalanced by the public gain.

I have a proposition I want to suggest. In the State of Nevada I know, as a matter of fact, that parties have necessarily, not through any fraudulent intent, cut timber upon the lands of the United States. I presume there are a great many instances where it has been fraudulently done, but you cannot distinguish between the two. I think it would be no more than fair to provide that where lands have been denuded of their timber (in the States of California and Nevada at any rate) that if the parties who had committed the act, either by themselves or by their agents, should come forward within a reasonable length of time and pay \$2.50 per acre, as a matter of indemnification, they should be released from any action; but they do not want, of course, to be liable to subsequent action for the recovery of damages. It seems to me it would be very well to have the statute perfectly clear upon that subject. It would give parties a right to clear themselves from any criminal and civil proceedings by paying to the United States what it asked in the first place.

In Nevada the wood was not cut for export, but for actual necessities in carrying on the business of the country. It has been burned in furnaces, and a great deal of it is underground. It has been used for the purpose of development and improvement. If a man cut and sold it and made something out of it, and if he now paid the government all that he would have been required to pay in the first instance, I think the government has got all it could ask. Under the rulings of the Attorney-General, after a party comes forward and pays \$2.50 per acre, this is simply a payment of the penalty, and the government is entirely at liberty to follow the lumber and take it wherever it can be found. I understand, further, that they claim the right to sue, in addition, for damages. I do not know, then, what the payment of this \$2.50 is for. I do not think the Attorney-General very clearly understands what it is for, either.

Q. Would it not be better, instead, to make a law whereby these parties could procure this timber either with or without sale, and without committing trespass?—A. Undoubtedly. There are many cases where the trespasses have been necessarily committed from time to time. For instance, the State owns certain lands; application is made, and the State authorities say we cannot sell the land because they have not been surveyed, and they cannot be taken up; or the party goes over to another tract of land. Many of these trespasses have been committed by agents without any understanding on the part of the principals. The agent is put upon the proper piece of land and told to cut on that land; and all at once it is discovered that he is cutting timber upon another piece of land. His employer finds it out, and it is claimed that he can be held responsible for it, and I presume he can. I refer to past trespasses. The parties ought to have the privilege of offering to pay \$2.50 per acre for stumpage, and all criminal proceedings stopped. If that was a fair price originally it should be a fair price now.

---

*Testimony of Harvey Carpenter, receiver, and James McMartin, register, United States land office, Eureka, Nev.*

EUREKA, NEV., November 3, 1879

HARVEY CARPENTER, receiver, and JAMES McMARTIN, register, made the following statement:

Papers in the land office should be reduced in number; all fees should be abolished and registers and receivers should be salaried.

Eureka is a mineral district. All mineral district recorders should be abolished and claims filed in the United States district land office. All mining contests should be tried before the United States district land officers.

Registers should have a seal, and should be authorized to subpoena witnesses to testify in land matters; as it is now many rights are lost because witnesses refuse to testify. Registers should also be authorized to perpetuate testimony. There should be a provision of law that settlers in final entries should be permitted to make their final proof, on forms, before a district or county judge.

This district is enormous; embracing the counties of Lincoln, Nye, White Pine, Eureka, Elko, Lander, and part of Humboldt. It traverses the entire length of the

State and is 200 miles wide, so that settlers, either in contests or in making final proofs, bringing witnesses from extreme ends of the district are compelled to go to greater expense than the lands cost in the land office. This is a great evil; registers and receivers should be authorized, when proof has been taken in contests, or abandonments of homesteads or declaratory statements, to at once, upon the reporting of such cases to Washington, admit filings for legal settlers. While the report is pending at Washington, which is frequently a year, troubles inveigh, and fights take place over the land.

I see no reason why a person should not be permitted to file as many declaratory statements or homestead applications as he likes, as there is nothing in the present law to prevent it. It is only a ruling. Every time a person files a declaratory statement or homestead on a piece of land the value of it is thereby enhanced, and an incoming settler gets the benefit of his improvements. It takes entirely too long at present to get a patent, and registers and receivers should have more authority.

We believe in the rectangular system of surveys, as all understand it. Settlers complain of the absence of stakes; they rot and are torn down, and the mounds and pits become obliterated. Stakes are frequently moved by settlers for illegal purposes. In a cattle country like this cattle rub against the stakes and paw the mounds down. The settlers in many cases have to hire surveyors and go to great expense to find the boundaries of their land. There should be some permanent system of monuments established, say at the corners of townships. It is almost impossible after five years to find a stake or mound. Triangulation to such isolated tracts of farming lands could be introduced to great advantage.

There is some agricultural land in this district—say one acre to a hundred—and there irrigation is necessary. The water in the district, which proceeds from springs, streams, and snow, is all taken up either by cattle or irrigation. In this district it is all pasturage land except this bit of agricultural.

It takes from 30 to 40 acres of land to sustain a beef. This district is overstocked, and the grasses are diminishing.

We believe in a pastoral homestead, say of 3,000 acres, on the arid lands of the district, leaving the present settlement laws in effect on lands which can be irrigated. Our water-right laws are under State law, and decisions of our district court give the first right to use of the water to the first locator, to do as he pleases with it. This gives him control of all the lands for agricultural purposes in his section.

No laws affecting the arid lands, either their sale or disposition, should be passed which will interfere with or injure present herds of cattle and sheep in this section. The actual occupants at present on the ranges by local custom should be permitted to permanently occupy them, either by purchase or permit from the United States Government, and be protected in their right to them. These lands should be surveyed and preserved for cattle ranges.

We think the best interests of the government and occupant would be subserved by the survey and sale of these arid pasturage lands. They should be sold in quantities on the basis of thirty acres to sustain a beef, and first to the present occupants of land, who could establish by oath before the register and receiver the number of cattle and sheep held by them at the date of the passage of the act. We think 10 cents per acre ample for them. Five sheep count as against one beef for grazing. One hundred cattle would sustain a family.

There are many contentions between sheep and cattle men about sheep going on cattle lands, they claiming that cattle will not graze on the lands grazed on by sheep. The government should at once settle all these matters as to the sale of lands, &c., for the sake of peace and quietness and to prevent further trouble. There have already been some men killed, others wounded, in controversies growing out of the sheep and cattle question. Giving each stockman the right to a specific range would do away with all this trouble. There is no lumber timber in this district properly speaking, what there is being only fit for fuel and charcoal and mining purposes. No timber has been planted here. The entire control of the timber lands of the United States should be put in the hands of the United States district land officers. In this district any person who wants the timber takes it. A man will go into the timber, build a fence around a large quantity, perhaps miles square, and by local law such an inclosure holds it. They post a notice upon it and record the claim in the county recorder's office. The timber that yet remains should be surveyed and sold to any applicant in unlimited quantities. The charcoal made from this scrub timber is indispensable for smelting. It is generally made by Italians and Swiss. There are estimated to be 3,000 Swiss and Italians engaged in this business within a radius of 40 miles of this town. They cut all the timber clean. The government should sell the timber free from the land. Prosecution for timber depredations as laws are now is impossible. The timber is mostly composed of very small nut-pine, piñon, and juniper, and is of no value for building purposes.

There should be some improvement in the description made by deputy surveyors of the topography of the country, and they should be required to take altitudes. Much land is now marked non-mineral which is mineral, and *vice versa*.

The present notice of intention to prove up is vexatious and useless and should be discontinued. The requiring of thirty days' publication has worked great pecuniary loss to settlers and prevents no fraud. Men who file on mining claims should be required to prove up and get title in one or two years at the furthest.

We have but 6 to 8 inches rain and snow fall in this entire district.

The desert-land act permits location on unsurveyed lands. The settlers should be compelled to give more accurate descriptions than now of their claims, so as to prevent them from moving around on the land.

We consider this a mineral and grazing State. Agriculture is only possible by reclamation of the land through irrigation. Where there is no water there can be no agriculture, and the land is already irrigated to the full capacity of the water supply. Our people utilize their water with great care. Reservoirs are practically useless because of the great evaporation, which is about one inch a day.

In contests for declaring vacant lands under the pre-emption and homestead laws, the person who brings the contest and has to pay for it should, being a legal settler and occupying the land, be protected by the government and have the first opportunity to get the land when it is restored to settlement. This is not the rule now.

---

*Testimony of E. S. Clark, surveyor-general of Nevada.*

E. S. CLARK, surveyor-general of Nevada, testified as follows:

I have been surveyor-general of the State for ten years. I am in favor of the retention of the present system of rectangular surveys of the lands of the United States. The system is well known to every settler, and they can find, with ease, the location of their lands.

Some system of permanent monuments should be established by the government at the intersection of townships. The wooden stakes are destroyed, some are burnt for fire-wood, and others rot away. Where cattle run over them neither mounds nor stakes last.

The deputy surveyors do not get enough pay for their work at present; the old prices of four years ago should be restored, as fair pay gets good work. I think there should be an inspection of surveys under contract, to be paid for by the government. I favor the retention of the contract system for convenience; a paid corps of surveyors would be a great expense. All my deputies use the solar compass. I think a great improvement could be made in the method of the description of the lands by deputy surveyors (in fact, a classification of the lands, taking the height of streams as the level of possible irrigation, by following the stream in the several townships and giving its elevation) by the government furnishing aneroid barometers or other instruments to ascertain elevations. It would not add much labor to the work of the deputy and would be a guide for the district land officers in the disposition of public lands. We do not survey anything but arable lands, and there is a great deal yet unsurveyed. The fees in mineral surveys are not, in my judgment, too high. Here we charge \$30 for office work.

The timber land should be surveyed and sold. I would sell it in unlimited quantities. Private ownership would be the best protection for the timber. A homestead or pre-emption filing should not be allowed on the timber lands of the Sierras, as men will cut the timber and then abandon it; these lands should be graded in price according to the quality of the timber.

The United States district land office should be given jurisdiction over, and control of, the timber lands for the purpose of uniformity.

I think applications for location of mining claims should be filed in the United States district land office, and all local mining districts abolished. I think mining claimants should be compelled to pay up for the lands and get title.

I would not survey or molest in any way the arid lands of the State. I would let them be used in common by herds of sheep and cattle, under a system of comity now established among themselves.

I call this State a mining and grazing State. Agriculture, solely by irrigation, is an incident. We have grass on the high lands—generally bunch-grass; in the large valley, white sage; all good for cattle, who don't touch it until the frost comes and sweetens it; then the farmer calls it winter food. The water privileges in this State are pretty nearly all taken up. Parties make application to this office for survey of their claims; the surveys are ordered and are made; the papers are filed in this office on return and approved; some are here that were made four or five years ago. Some law should be passed or rule made forcing these people to make appearance in a reasonable time to the district officers and make payment for their claims.

There should be a law passed prohibiting a surveyor-general from ordering a deputy

surveyor, on application of a claimant, to make a duplicate survey of the same mineral ground when it has once been abandoned.

In this State when a mineral claim overlaps another previously surveyed, the deputy surveyor in his field-notes excludes the surplus ground, and the conflict is shown by metes and bounds the same as a regular survey.

Our incidental expenses of this office are very large and irregular; we should have \$3,000 per year for incidentals; we used to have, four years ago, \$4,000. The salaries of this office are too low; they should be increased to the same as the California office, as living is twice as high here as in California.

I think fees should be abolished in all matters between the public and the lands, and fixed salaries be paid the officers.

---

*Testimony of Capt. T. C. Ford, Virginia City, Nev.*

VIRGINIA CITY, NEV., November 1, 1879.

Capt. T. C. FORD, collector of internal revenue, testified as follows:

I have been connected with the Internal Revenue Department for eleven years, and know the State of Nevada pretty well. I consider this State a mining camp and a mining and grazing State. Agriculture is a mere incident here, and then only with irrigation. I do not favor any survey and disposition of the arid lands of this State for the next twenty years, because the lands would fall into the hands of monopolists. In my opinion it is impossible to segregate the arid from the irrigable lands. I hear of no trouble nor agitation on this point among our cattle and sheep men.

I would survey and sell the timber lands. The government should get as much for the timber lands as private persons and corporations. I would not limit the quantity that should be sold to an individual.

---

*Testimony of I. E. James, Virginia City, Nev.*

I. E. JAMES, civil and mining engineer, of Virginia City, made the following statement:

Have been twenty years on the Comstock Lode, and have done most all the underground work on the Comstock up to two years ago. The present United States mining law is a pretty good law, except that parties have been permitted to locate non-mineral lands as mining land, to the detriment of actual miners. No person should be permitted to locate a claim unless they have mineral. Exploration should be free and permitted on all mineral lands, but no location should be allowed without a party having struck mineral in the place. Under the present law a man may locate a claim 600 by 1,500 feet and hold it against a person who is actually in use of it. Frequently men are compelled to locate mining grounds around their shafts, knowing them not to be mineral, and hold them by doing the work required by law—\$100 per annum—so as to keep them from being located by other parties. At Yellow Jacket shaft, which is 2,500 feet east of the apex of the Jacket ledge, the company were compelled to buy at a high price a mining location which should never have been permitted to have been made, because there was no mineral upon it, and, to get ground enough for their dump and works, were compelled to purchase another claim, on which claim the company are compelled to do \$100 worth of work per annum to hold it. Otherwise it would be relocated for no other purpose but to extort money (blackmail) from the company; so no location of a mining lode should be allowed except where mineral is in place. The same thing occurred at the east shaft of the Overman, and cost the company a great deal of money. A good mine results in blackmailing suits and jumpers.

I think all mining claims should be recorded in the United States district land office for safety for title, provided convenience be made for miners at a distance, at present on record in the county recorder's office, where the title is kept.

The time required now to get mineral patents is too long. There have been delays in mining patents before the department uncalled for. I know of the case of a man who made application for a patent to the department. The papers were duly forwarded by the local officers some four years ago. In answer to several letters to the care of the Land Office he received a note from an attorney at Washington saying that if he would send a certain sum of money to him he would get his patent. He refused, and when Schurz came in he wrote him, and soon got the patent.

A man should not be compelled to pay up in a given time for his mining claim. In many cases men are too poor to get a patent for their mining lands.

The proposition for the location of mineral claims in squares I have not considered.

I think the timber lands adjacent to the mines should be sold in unlimited quantities and the price graded. Timber should be sold separate from the land. There is some destruction of timber by fires, but a small amount, however. Men who own the timber lands are very careful of them. It is absolutely impossible to mine without timber. The timber lands of the United States should be placed under the control of the United States district land officers. If the timber lands are not sold, persons should be licensed to cut it by the district officers. Lands which are known here as timber lands are taken solely for the timber. The land in some cases contains mineral, and is valuable to the government for mineral purposes.

The tunnel act of the United States is very absurd, and the law, as interpreted by the Land Office and in California courts, means simply a right to the width of the face of the tunnel. The law is of but little use as it now is.

When I first came on the Comstock, in 1860, wood was \$16 per cord. Lumber, square timber and all, was \$23 to \$25 per thousand. This was after the mills were built. The railroads and flumes since then reduced cord-wood to \$10.50 and timber and lumber \$17.50 delivered.

The mining law now requires that a man shall maintain conspicuous monuments at the corners of his claim. This is now sufficient.

There is no definite width to the Comstock lode; you may say it is from 300 to 700 feet wide. The foot-wall of the Comstock lode is well defined. The true hanging wall is broken and is not well defined.

In regard to locations of mines the law requires that the ends of all locations shall be parallel. This is well enough, except where two adjoining claims may be located with diverging or converging lines. In case the lines are divergent, the law does not admit of the location of the gore between the diverging lines. In case of the converging lines following the dip of the vein, the government having issued a patent to each claim, a conflict would arise where the two converging lines crossed. The law should be changed so as to allow of a location without parallel end lines, so that in case where there was not 1,500 feet in the locations, and the lines diverged in following the dip of the vein at a point where they became 1,500 feet apart, then they should be made parallel. There are claims on this lead where, in course of time, conflicts will probably grow out of lines crossing.

---

*Testimony of John Skae and F. A. Trittle, at Virginia City, Nev.*

JOHN SKAE, mine owner and manager, testified at Virginia City as follows:

The mining law is good enough as it is, but parties have obtained many fraudulent patents under it. I think the local mining districts should be abolished, and all claims be recorded in the United States district land office.

There is a great deal of expense and trouble at present in getting patent title. In the case of the Sierra Nevada, the company I am president of, we were offered patent for our mine for \$5,000 by an employé of government. The other adverse parties paid \$5,000 for a patent (the Union) and took therein 300 feet of our grounds. We started to litigate, but compromised sooner than be at the expense of contesting the matter. I have been on the Comstock lode since 1859. A square location without condition of protection to mine owners and actual miners is unfit for the Comstock lode. An actual square location would stop mining here at once.

F. A. TRITTLE, banker at Virginia City, heard the above statement and confirmed the same:

I have been all over the State, and consider it a mining and grazing State. All agricultural land would have to be irrigated, and it is a mere incident. I would not sell the arid lands, as no man could pay taxes on such land and make a living. The government lands should be examined by government officers and classified, and arid lands put aside for grazing. It would be a good plan on the part of the general government to give these arid lands to the different States, because the State authorities know best what to do with them. The general government should set aside in the State enough lands to be sold to establish a permanent school of mines on the Comstock lode. The government should also give the State an allowance of lien lands in place of 16th and 36th sections for school purposes.

*Testimony of B. F. White, Beaver Cañon, Idaho.*

B. F. WHITE testified at Beaver Cañon, Idaho, October 7 :

I have lived in Malad City twelve years. I was its recorder and treasurer for a long time. Idaho is hardly an agricultural country. About 1 acre out of 75 could be cultivated. The timber is all confined to the mountains. About one acre in a thousand is timber; it is mostly arid pasture land. In this county taking the entire area, it would take 100 acres to keep a beef. The grass is very scant and poor. Sheep are destructive to grass. They would soon kill out these ranges so that they would not be good for anything. The ranges are deteriorating. The ranges to-day in this county will not sustain one-twentieth of the live stock they would ten years ago. If these lands were in possession of the people, either by use or purchase, it would be much better. It is the only way to save these pasturage lands. They would then get better beef and more of it. I think the pasturage homestead is a first-rate idea. It would settle the country up as fast as it is susceptible of being settled. I have often thought of it, and I think it should be done. The large cattle owners ought to be protected, either by leasing the lands to them or allowing them to purchase. Idaho is mineral and pastoral, and these two interests must be protected. They are the wealth of this country. Cattle men are the only ones who take any interest in preserving the grasses. They now make some endeavor by uniting their herds and by pasturing alternate sections to preserve the grass.

The water rights are very well taken up. The water law here is: the first man who gets it keeps it, and the man who first takes it out retains the use and control of it, so far as natural needs are concerned, and then it goes back in the stream and his neighbors are entitled to the surplus. The only way any amount of water could be taken out is by uniting capital. The government should encourage irrigation by giving the companies proposing it each alternate section of land, or by offering some inducement.

The only mining district here is the Cariboo district. It is simply developing now, but there are good prospects of finding good lode claims there.

This is rather a poor county. The timber here is ravaged by fire all the time. No one now has any particular interest in it, and nobody cares for it. Something should be done to preserve the timber. I would put the whole matter under the district land offices, just as agricultural lands are, and I would arrange for the sale of this timber, in some way, so that persons would have some interest in it. They must preserve it. It is set fire to by Indians in order to run the game out; prospectors set fire to it and travelers are careless about their camp-fires. All the timber here is pine; there is no hard wood. No timber has been planted here yet. This arid land that is not susceptible of irrigation, I think, is worth about 5 cents per acre; that is as much as the government can expect to get for it. I think individuals should pay for the surveying, but that expense is as much as the government can expect from them. I think these questions should be settled at once. Now is the time. If it is not done there will be difficulty when the future population comes in. So far there has been no direct conflict between the cattle and sheep men. Cattle cannot stay where sheep will. If properly taken care of, 100 cattle will support a family. There is not much fencing here. You cannot fence cattle during a storm. The only way to fence a winter range would be to fence the bottom land where there is shelter for the cattle. I would not sell these lands in unlimited quantities, but would allow a man to take them in proportion to the cattle he has at the date of the passage of the act giving authority to sell them. The wealth of this country is in its herds, and always will be.

I think the rectangular system is a very good one; but there is very much bad work being done. Men cannot find the corners after one or two years. The stakes are destroyed, and the cattle paw the heaps of dirt down.

The supply of water here does not increase. Some years we have an abundance of water when we have had heavy snows, and then again when we have late snows we have little water; the streams then go almost dry. The Malad Valley has heretofore always had a splendid supply of water; but this year it has had so little that the crops have dried up. I always considered that the rainfall had gradually increased, until these two years past; but my experience for two years has contradicted that idea. The melted snow ordinarily provides enough water to ripen our crops. There is no dependence to be put on the rain. We raise all the cereals and all the vegetables that grow in a northern climate. To irrigate 100 acres right, and to irrigate it when needed, it would take 100 miner's inches of water flowing twenty-four hours. Different kinds of land take different amounts of water; it depends of course upon the kind of land. Irrigation enhances the value of lands by bringing in fertilizing salts and minerals. Lands that grow wheat crops year after year would not begin to grow the same crops in any other country. They would not wear as well without fertilization. Take this sage land: it looks as though it would not raise white beans; and yet it would raise fine crops of wheat for ten or twelve years without fertilization.

I do not know much about mines or mining, but I would place all questions pertaining to such matters in the hands of the registers and receivers of the local land offices,

I would permit the right of appeal to any local district court if there were two claimants to a piece of land. It is worth ten times more than a piece of land is worth to go to law about it. I think the papers in the land office could be much simplified and condensed. Everything connected with the land office is too expensive. The very routine you have to go through tends to confuse you in a hundred different ways; whereas if you had it simplified, and could have a case settled right at home in the local land office or in the local courts, it would cost much less. In proving up men have often to go five hundred miles to do it. The whole thing should be simplified. That is my experience after hundreds of entries.

---

*Testimony of William G. Town, register, and E. S. Crocker, receiver, United States land office, Evanston, Wyo.*

EVANSTON, November 4, 1879.

WILLIAM G. TOWN, register, and E. S. CROCKER, receiver of the United States land office, testified that they have been register and receiver ever since the organization of the above-named office.

The Evanston district embraces three counties extending, approximately, 400 miles from north to south, and 200 miles from east to west.

It is our opinion that the forms, &c., of papers in the land office should be simplified; registers and receivers should have a seal, and should have power to subpoena witnesses and perpetuate testimony. Our experience has led us to the conclusion that fees should be abolished, district land officers paid regular salaries, and that settlers should not be required to pay fees, as such, but that all fees should be embraced in the acreage cost of the land. As it is now local land officers have very little executive responsibility and are really only outside clerks of the department. This should be changed and they should be clothed with some official authority.

In cases involving contest or abandonment on desert, swamp, or homestead lands it requires three months, on an average, to forward the cases to the department, and to have the case cleared up there and returned. The register and receiver should have authority to act in such cases and to send up the papers or file them, in their discretion, and let the legal qualified settler file at once; as it now is, the wrong man sometimes gets the land. A person should have the right to file as often as he pleases, on a desert, swamp, or homestead claim, because the land is enhanced in value by his improvements, the government does not lose anything, and the man himself does not eventually get more than one homestead. In our opinion miners and agriculturists should be allowed to file a thousand claims, if they so desire, until each gets a tract to live on.

More than a year ago we sent up cash entries for patents that have not been issued yet. All land cases should be patented in turn.

The present homestead and pre-emption allowance of 160 acres per settler is totally and entirely inapplicable to the lands in this district, which are of such a character that a settler and his family would meet certain starvation on any such sized tract.

The lands in this district are timber, mineral, and grazing. All the grazing lands are arid. There is no rain and no snow and but few running streams. The stock water comes from springs and streams. There is no agriculture to speak of in this district, all supplies of food other than the article of meat coming from California, Utah, Colorado, and the Eastern States. The timber in the mountains is mostly spruce and aspen, and cottonwood grows along the banks of the streams. We are informed that the north slope of the Black Hills is covered with beech, walnut, and pine. No timber has been planted in this district. Taking all the lands in this district we should say that 1 per cent. or less was in timber, and the rest, even the mineral lands, grazing. The timber lands should be surveyed and graded and sold in unlimited quantities, with this restriction or regulation: that the purchasers should clear off all dead timber so as to prevent fires, and that no timber should be cut for speculative or manufacturing purposes that was not over 8 inches in diameter. With a view to preventing fire, all dead timber now on the public lands should be given to any person who would remove it. The timber should be sold separate from the land, the title to which should remain in the government.

The United States district land officers, who live with the people and know their wants and ways, should be given full jurisdiction over the timber lands.

Settlers should not be prevented from cutting poles and posts for fencing, but they should be required to cut them out of the thick undergrowth so as to give the remainder of the timber a chance to grow. The destruction of the timber at this time is fearful. Twenty-five times more is destroyed than is used by the people. At the present rate, fire alone will utterly destroy all the timber within this district in five years. When once started they generally sweep clean, burning not only the standing and

dead timber, but the young growth and seeds as well, and the timber does not come up again. Fires are started either by the Indians driving game, or by white men through carelessness and recklessness. Persons can go on the timber lands and cut what timber they like, and much is unlawfully cut.

The arid or grazing lands should be surveyed and sold in quantities to suit purchasers at a price not to exceed 10 cents per acre. Pastoral homesteads of from 3,000 to 3,500 acres should be established by law. One hundred head of cattle in this country will keep a family; 25 to 30 acres of this land will feed a beef. Under constant sheep or cattle feeding the nutritive properties of the land gradually decreases, but if stockmen had specific ranges under their permanent control they could then move their cattle from part to part, and the grass, which is mostly bunch, could be preserved.

No law should be passed which would destroy our present cattle or sheep herds. They form the wealth of this country, which is solely adapted to grazing purposes. If the government does not sell these arid lands it should permit the present cattle and sheep owners to lease or occupy them under some law or regulation based upon the number of cattle and sheep they own at the date of the passage of the act, and the district land officers should issue permits to occupy quantities of land on proof of the size of their herds being made, and the same officers should have the power, as now, to take evidence of abandonment, and permit other occupants to go on the disused lands. The desert land act works well in this district; 640 acres is ordinarily sufficient to make effective its purpose.

The present system of surveying the public land is effective, and should be retained. The people are used to it, and can easily find their lands. More durable monuments and corners should be erected, and deputy surveyors should be held to strict compliance with their contracts. The boundary line between Utah and Wyoming was run in an improper and unskillful manner; posts are not set as required by law, and are missing in many places for miles consecutively. They are generally broken down by cattle. Wooden stakes should be done away with and metal substituted and driven into the ground so as to protrude therefrom about six inches. They would not decay as wooden stakes do, and the cattle would not be able to break them down.

There are no perceptible climatic changes in this district. There is a necessity for distinct cattle and sheep ranges, though cattle will graze on sheep lands for at least three seasons. In some parts of the district all the water that is available for stock has been taken up.

The final notice to prove up should be abolished.

There are about 100 townships plats in this office; in about two-thirds of the townships there is not a settler. We need surveys at present badly, and the sixth standard meridian line should be run so that townships can be surveyed and subdivided. This standard would run through Bear River Valley, which is the best part of the district and is well settled.

The best part of the district is occupied by the Shoshone and Bannock Indian reservation, which is about 75 miles square and contains from 1,500 to 2,500 Indians. This reservation contains a great deal of mineral—gold, silver, &c. There is no game in it and the Indians have to be fed by the government. They should be allowed 160 acres for each family and the rest of the reservation should be open to settlement.

Artesian wells have been sunk to the depth of 500 feet here, but were failures. There is one petroleum-oil spring in the northern part of the district and the oil obtained therefrom is used on the Northern Pacific Railroad for lubricating purposes. It flows about 30 gallons per day.

Coal extends from the line of the Northern Pacific Railway up to the Yellowstone.

This district could sustain fifty times as many cattle as are now in it.

All mining districts should be abolished and all claims recorded in the United States district land office, which should have authority to try all contests in mineral cases.

Experience has shown that square location in mineral (lode) claims would stop litigation. If made square the claim should be larger than 1,350 by 1,350.

The mining laws are very indefinite and complicated and are but little understood. They should be repealed and simpler ones substituted.

#### *Testimony of Laurence F. J. Wrinkle, mining surveyor, Virginia City, Nev.*

1. What is your name, residence, and occupation?

Laurence F. J. Wrinkle; Virginia City, Nev.; mining surveyor

#### LODE CLAIMS.

1. What experience have you had, and where and in what capacity, in the business of mining, mine surveying, and mine litigation?

Employed in United States surveyor-general's office, Nevada, about three years.

Have been mining surveyor principally on the Comstock lode about nine years. Have also within the last three or four years prepared, either wholly or in part, the mining applications for United States patent of about a dozen claimants.

2. What defects, if any, in the United States laws, their operation and administration as applied to lode claims, do you know, either from your own experience or from observation?

(1) The law is not sufficiently strict in requiring the location to be properly marked upon the ground. (2) Permits location records, which are often indefinite, because the descriptions of the claims are made by persons who do not understand how to describe them so a stranger can find out where they are situated. (3) Does not require the locator to see that his monuments are kept in their proper places upon the ground. (4) Does not require proof of having done one-hundred dollars' worth of holding work upon the claim during the year to be recorded, nor to specify *where* on the claim such work has been done.

As far as my observation goes, a very large part of mining litigation springs from disputes as to the actual position in which the original location-stakes of claims stood upon the ground (after such location stakes have disappeared, and the recorded notice of location merely describes the claim with reference to said stakes, with little or nothing to show how the actual position of those location-stakes is to be found in case they are removed or destroyed), and from disputes as to abandonment or failure of the prior locator to do the holding work required by law, such disputes arising in great measure on account of the laxity of the law in the particulars above mentioned.

Another defect, in my opinion, is the provision which requires the end lines in all cases to be parallel. Take, for example, the case where No. 1 and No. 2 locate on the same lode, G H, leaving an intermediate portion of the lode less than 1,500 feet in

length, which No. 3 locates. No. 1 has made his end lines parallel with each other, and so also has No. 2; but No. 2's end lines are not parallel to No. 1's. Now, under the rulings of the General Land Office, if No. 3 makes one of his end lines coincide with the end line E F of No. 1, he cannot make his other end line coincide with A B, the end line of No. 2, but must run it in the direction C D, parallel to his other end line E F, leaving the triangular portion D C B, which nobody can locate, although the claim of No. 3 may be much less than 1,500 feet.

A still further defect is that the law does not indicate (at least, not fully) how the rights of contestants are to be determined in case a prior locator has mistaken the course of the lode, which, instead of running lengthwise of his location, proves to run diagonally across it and into a subsequent location. The following sketches will show more clearly the cases I would call attention to: (See diagrams marked "Case A," "Case B," "Case C.") I have given to each contestant the ground to which I imagine he is entitled; in fact, I have decided the cases for myself, whether rightly or wrongly is immaterial, as far as the object of illustrating the want of clearness in the mining act is concerned. In "Case A" the prior location, "No. 1," runs diagonally across the lode M.N, one end line, A B, crosses the apex of the lode at P, and the lode passes on of the location at the point F on the side line A C. A subsequent location, "No. 2," is made, of the which the end lines are G E and H K. How are the claims of No. 1 and No. 2 to be adjusted? In the case of *The Flagstaff S. M. Co. vs. Helen Tarte* (reported in *Copp's Land Owner* for June, 1879), the court, in speaking of a person who (similar to No. 1) locates crosswise of a vein, says: "If he does locate his claim in that way, his rights must be subordinated to the rights of those who have properly located on the lode. Their right to follow the dip outside of their side lines cannot be interfered with by him. *His right to the lode only extends to so much of the lode as his claim covers.*" \* \* \* Though it should happen that the (crosswise) locator, by sinking shaft to a considerable depth, might strike the same vein on its subterranean descent, he is not to interfere with those who, having properly located along the vein, are pursuing their right to follow the dip in a regular way. So far as he can work upon it, and not interfere with their right, he might probably do so, but no further; and this consequence would follow irrespective of the priority of the locations."

Now, since the end line A B, crosses the apex of the lode, "No. 1" is entitled to follow the lode in depth along the vertical plane of said end line; but from the point F, where the vein leaves the claim through the side line, I think the above-quoted decision would indicate that "No. 1" is only entitled to follow down the dip of the lode; that is, "No. 1" would be bounded at the end next "No. 2" by a vertical plane passing through the point F at right angles to the course of the vein until such plane intersects the plane of the other end line C D, at S, then from S "No. 1" would be bounded by the plane C D S Z of the end line C D. "No. 1" should be limited by the plane of the end line C D Z in place of allowing him to follow indefinitely the plane F S W beyond the place of intersection, S; because, if he were allowed to do so, he would eventually acquire much more ground than he originally located.

Case A.

"No. 2" must, towards the surface, relinquish a portion of his claim and respect the boundary fixed between "No. 2" and "No. 1," but with increase of depth "No. 2" may finally reach the plane of his original end line G E, beyond which he must not pass, and a piece of vacant ground will then be left between "No. 2" and "No. 1."

"No. 3" having to respect the boundary plane of "No. 1" on one end, and his own end line V T at the other, finds his claim to diminish in depth; but he can only blame himself for not locating his end lines parallel to "No. 1."

In case B, "No. 1" has not succeeded in crossing the apex of the lode with either end line; adopting the rule followed in Case A, that he is only entitled to follow

Case B

the dip of the lode between vertical planes at right angles to the strike or course of the lode, said planes passing through the extreme points of the lode intersected by the side lines of his location until he is intercepted by the plane of

the end line established by himself; thus "No. 1," the prior locator is in depth shut out altogether. But on ascertaining this state of things he is at liberty to make a new location, taking in some or all of the vacant ground shown on the diagram, provided such new location does not conflict with the rights of third persons.

Case C is a modification of cases A and B, readily understood from the diagram.

Case C.

There are locations in this district which will probably in the future give rise to the questions presented by cases A, B, and C, and perhaps the law should indicate the rule to be followed in deciding them. If so, a fixed method of determining the average course of the lode through the ground in controversy would also need to be prescribed.

Another case which might arise and work injustice under our present law (although I am not aware of such a case having actually occurred) is this: "No. 1" discovers a lode some distance below the surface in the shaft B, and makes his location "No. 1"; afterwards it is found that owing to the dip of the lode the apex is all within the sub-

sequent location "No. 2." Does it not follow from the decision in the case of the Flagstaff S. M. Co. vs. Helen Tarbet, above quoted, that "No. 2," who has "properly located along the vein," shall hold the same against the prior discoverer "No. 1," who has not properly located? Should not the law be amended to allow "No. 1" in such a case a certain limited time, say 60 days, to ascertain the true direction and dip of his vein, and make a proper location? Requiring him, however, to immediately file a record notice of such discovery, stating what length along the vein he intends to take on each side of the shaft.

4. What do you understand to be the top or apex of a vein or lode? Can or cannot the top or apex the course and angle or direction of the dip, always be determined in the early workings of the veins or lodes?

In case the vein outcrops at the surface, I would call any portion of such outcrop the top or apex. If the vein does not reach the surface, then the highest point to which the vein or lode can be traced is the apex (not necessarily the nearest point to the surface, but the absolute highest point), using the term vein or lode in the sense adopted in the case of the Eureka Consolidated vs. Richmond. If the vein does not outcrop on the surface, the apex is only to be discovered by exploration. The course on the surface, owing to inequalities of elevation and of the dip of the ledge, often varies from the course shown by a level underground. The dip may change to be steeper or flatter from one level to another. Generally in making locations no systematic effort beyond surface observation is made to ascertain the apex and course of a ledge; reliance is placed on luck very often in that matter as well as in the matter of finding pay ore in the claim.

5. I think all rights a discoverer or prospector actually secures (although in some cases not all he intended to secure) under his location can be properly defined and protected by the present law with some few amendments. I think a prospector who locates a claim and strikes a lode which turns out to belong to his neighbor, because the top of the lode is in the neighbor's claim, has no more reason to complain of the law than he would if he failed to find ore in his claim. In the same way a man who locates across a lode instead of along it—the law gives him the right to locate 1,500 feet along the lode—but if he makes his location, in the exercise of that right, in a way to cover less than 1,500 feet, he can only blame his own ignorance or want of luck. Let it, once for all, be understood that the location must cover the apex of the vein throughout the length of the claim, and more attention will be given to this matter by locators and purchasers. In general, a man can hardly be called a discoverer of a lode if he is ignorant of its position on the surface, or he may discover 500 feet but not 1,500 feet.

6. Litigation has, but not to my knowledge any injustice.

7. Yes.

8. No.

9. Yes.

10. Yes; but the locator might have made his location follow the windings of the lode.

11. In general, I believe it makes no difference to the locators upon true lodes how many locations are made upon barren ground. I apprehend that, at the outset, especially in a new mineral district, it would be a difficult matter to draw the line between what are locations on real lodes and what are locations upon barren ground. This facility of making alleged mineral locations has enabled individuals to monopolize the surface-ground in front of certain claims on the Comstock lode, which Comstock claims required the ground for shafts, &c., and had to pay a few thousand dollars extra for the ground to the "wild-cat" owners. Comstock owners have thus compromised with these claimants instead of availing themselves of the Nevada statute (which allows non-mineral lands to be condemned where necessary for the effective working of a mine), except in the case of the Oberman Company *et al.*, which procured the condemnation of the "Yankee" mining claim for a site for the Forman shaft. Litigation in this case is still pending; this litigation, if persevered in, may help to determine what, under the law, constitutes a valid mining claim. In a mineral district, small seams may very often be found yielding low or tolerable assays of precious metal, and occasionally these small seams lead to workable deposits of ore, though ordinarily the contrary is the case. Many of the barren "wild-cat" locations cover such small seams. Between the United States and the claimants of alleged mineral ground, it would seem to be to the interest of the United States to dispose of its title and receive pay for the same. Let those who wish to prevent the sale of United States land as mineral prove its non-mineral character in every case. Greater strictness in requiring the full amount of the annual expenditure, and a provision analogous to that suggested in reply to question 22, would do away with many of these wild-cat locations.

12. Yes, litigation is liable to occur. The legislation of the mining States, I believe provides for such cases.

13. As to the first question, I reply, yes. As to the other question, I am sure the bulk of the litigation in this district arose from the causes specified in reply to question

No. 2, and from disputes as to whether the Comstock lode was only one vein or several parallel veins; the locations about which most of the litigation has occurred having been made under the act of 1866 or previous thereto.

14. Accepting the definition of a lode as given in the decision of the Eureka Consolidated vs. Richmond as the true one, which I think it is, "the variety and complexity of mineral deposits in rock in place" enters but slightly into the question. The question really will be whether the "lode" (as thus defined) can possibly be traced by means of its walls, as they continue downward beyond the side lines of the location; when the dip of a vein can thus be followed downward, it is quite possible also to ascertain the apex of the vein merely by following the dip upward instead of downward; and whoever has the apex must have the whole vein. Of course, where there is any doubt as to whether the mineral is contained in a regular "lode" or in an irregular deposit, litigation to bring forth all the facts of the case must ensue. I do not believe any law can be devised which will entirely shut off litigation; cupidity will always be able to devise ways to attack valuable mining property.

To give the right to the discoverer of an ore-producing vein to make a square location of 1,500 feet on a side, with the right to all the mineral included within vertical planes passing through the lines of such location, not permitting such locator to follow the dip beyond his lines might prevent some of the litigation which now arises. But would not litigation on new points arise to take its place? And would not such a system have drawbacks that would counterbalance whatever advantage might follow immunity from litigation? One of the drawbacks is, that while the lucky prospector or discoverer might reap a greater reward than now for his exertions, since by discovering a comparatively unimportant vein he might secure a much richer vein lying within 1,500 feet, of whose existence he had no knowledge at the date of location; in fact, he might, by the discovery of a small outcrop, easily monopolize a large portion of a valuable mining district, shutting out many just as diligent and meritorious prospectors as himself—the present law giving the discoverer all he actually finds—while the square location might make him the constructive discoverer of a vein a thousand times more valuable than the one he really found, yet, on the other hand, the square location would place the actual ore producer and developer of mines at a disadvantage as compared with his privileges under the present law. By square locations a few impetuous individuals might monopolize a whole mining district and thus retard its development. Capital would also be more afraid to invest than now, because every vein with a dip would have an artificial bottom (where the vein passes out of the location), and the real bottom is now very often reached too soon.

The annexed diagram shows how such a law would have worked on the Comstock.

The red lines A, B, C, D, represent the boundaries of the first series of square locations, and C, D, E, F the boundaries of the second series of square locations that would have had to be made on the Comstock lode, and the dotted red line shows the eastern limit of the present workings at an average depth of probably 2,400 feet below the croppings. The places shaded red upon the map and marked bonanza indicate all the ore-producing ground thus far found within the limits of the supposed second series of square locations. As it would be manifestly impolitic to let such square locations be valid until ore was actually found within their limits, the majority of the Comstock companies would now be drifting around without secure title to any ground, which circumstance would render it difficult to collect assessments to prosecute further explorations. As an illustration, consider the case of the Sierra Nevada and Union. The Sierra Nevada and Union bonanza was discovered by the Sierra Nevada Company at a depth of 2,100 feet; this company vigorously explored the full length and breadth of their location at different levels through the Sierra Nevada shaft, doing all the work by assessments, and most of the time through very unpromising ground, with no encouragement except the fact that the lode still continued and the hope that finally an ore body would be reached. Could the Sierra Nevada Company have raised money to spend on such work if there had been any danger of a stranger sinking a shaft and striking the ore before them, and thus depriving them—the grantees of the original discoverers of that portion of the Comstock lode—of the fruits of all their labor, as would be possible under a square location law? As a fact, the Union shaft, which was started and sunk 1,300 feet by an outside company in the hope of finding a ledge east of the Comstock, would certainly have reached the ore before the Sierra Nevada workings if the then owners of said shaft had been incited to energetic work by the chance of securing a part of the Comstock lode. The Union shaft reaches this ore body at a depth of about 2,250 feet. Yet in all probability if such square location law had been in force, neither the Sierra Nevada shaft nor the Union shaft would ever have been sunk, nor the bonanza, worth millions, ever found. For before the present Sierra Nevada shaft was started an older shaft was sunk 800 feet and the vein prospected therefrom at different levels, all the way through barren ground; if to this fact had been added uncertainty as to the further depth to which they might go before being cut off by some more fortunate explorer, the costly hoisting works over the present Sierra Nevada shaft would never have been erected, and the ground would

have been condemned in popular estimation as utterly worthless and barren, and it would have been impossible to raise money for any mining operation in that vicinity.

Another complication which I imagine might arise under a square location law is this: The first discoverer of an ore body being entitled to make his square location in the most advantageous way, in the case before us the Sierra Nevada Company, having reached the ore long before the Union, would locate directly in front of said Union Consolidated Company's workings, cutting them off altogether after they have spent years exploring the barren upper portion of the lode—a hardship and injustice beyond any likely to happen under our present law.

Moreover, it necessarily follows that if a miner were not allowed to own his ledge beyond his side lines, that portion beyond would be subject to appropriation (to the extent of 1,500 feet square) by the first one who would sink a shaft, strike the ledge and discover ore therein. It is not a sufficient answer to this to say that the original locator would have an equal chance to sink and explore beyond the side lines of his location; because the simple sinking of a vertical shaft is not subject to so many delays, difficulties, and dangers as attend the opening of a mine from level to level throughout its length and breadth, and the extraction of such ore as may fortunately be found, the raising of which ore of course delays sinking. The case of the Savage and Hale and Norcross companies may be referred to as an example. These companies have worked along the vein to a vertical depth of about 2,500 feet below the outcrop and (as shown by the dotted red line on the diagram) have nearly reached the easterly limit (red line E F on diagram) of the second series of supposed square locations. At this depth a tremendous influx of hot water occurred in the Savage mine flooding it and the Hale and Norcross. Very expensive pumping machinery was put up by each company for the purpose of disposing of the water. After the expenditure of more than a million of money and more than two years' labor, they have with the aid of the Sutro tunnel drained their mines. This contest with the water strained to the utmost the resources of these companies; during the time that they were struggling with that element which has caused the abandonment of so many productive mines a company of adventurers might have sunk a shaft, say in the position of the Requa shaft, down into the Comstock lode. Would it be fair now to give such adventurers an equal chance with those companies to search for ore and enjoy it when found? So, two or more companies of adventurers might sink shafts near each other in front of the Comstock lode, the company that found ore first would survey the other shaft into their location, at once a waste of capital and a fruitful source of litigation.

Furthermore, the party sinking a shaft over the dip of a vein, beyond the limits of a prior square location, would enjoy another advantage over the original locator working down on the dip of a vein, in the possibility that his shaft might develop, at a lesser depth, an outlying vein or a seam or feeder of the vein originally sought, which might yield ore, thus securing to the owner of the shaft his location 1,500 feet square and at the same time destroying the prospects the original locator had of being able to follow his lode beyond the side lines of his location; and in case such original locator, fearing the above result, were himself to start a shaft for prospecting beyond his side lines, he would have to weigh his chances of competing with rivals in choosing the site of the shaft instead of considering its advantages for the economical working of the vein in the future as is now done; witness the Forman, Requa, and Osbista shafts, which are located far beyond the line of the second series of square (1,500 feet wide) locations. That the above objection has foundation in fact may be seen by referring to the Silver Hill and Justice claims, shown on the diagram, at the south end of the Comstock lode. In front of them lie several claims containing ore; one of them the Cook and Gray, has yielded more than forty thousand dollars' worth of ore. If square locations had been allowable, this ground in front would naturally be located somewhat as shown by the yellow shading (occupying the whole of the second tier of square locations), and thus the Silver Hill and Justice mines would be out off from further working. But under the present law, which suits them very well, these mines which probably so far have no more than paid expenses, although they have yielded about two million dollars' worth of ore, thus benefiting the community, being not possessed of machinery well calculated for deeper workings, continue their exploration in the hope of finally finding a bonanza which will yield a profit on all their expenditures.

To show how litigation might in another way arise from square locations, I have placed in their true position upon the diagram a few of the "outside claims" that abound in the neighborhood of the Comstock, namely, Scorpion, the Leviathan, and the Sullivan. The heavy lines show the present limits of these locations, and the yellow shaded line what they would probably have been (1,500 feet wide) under a square location law. These claims all have promising ledges of their own, and may, by further exploration, find ore. The Scorpion has a United States patent. Under the present law they are a detriment to no one except, perhaps, their owners. But under a square location law, and the stimulus of a prospective slice of the Comstock, they might possibly be soon induced to yield sufficient ore to render them valid square locations, and then

owners would become the owners of all mineral within their boundaries to the center of the earth, with what results to Comstock mines the diagram shows.

Señor Gamboa, in his Commentary on the Spanish Mining Laws, mentions a case where the pious claimants of such a square location took the priest out to bless the pit out of which the ore which made the location valid had been taken in order that success might attend their further explorations. It afterward was found they had altered the pit. I fear, if we should introduce such a law, many an honest miner would have occasion to curse such pits. From the numerous lawsuits referred to by Gamboa, we should infer that litigation was rather frequent under the Spanish (square location) laws he treats of.

The truth probably is that a square-location law would work passably down to a limited depth, beyond which the interests of deserving miners would suffer. The Mexican-Spanish (square location) law was suitable for its day and generation, but that day has passed. When said law was framed 600 or 800 feet was an astonishing depth to work a mine. About that time a Mexican drain-tunnel, pushed with every resource of skill and energy, was advanced toward the Biscayna vein 2,500 feet in five years. The Sutro tunnel commonly advances more than that in nine months. The Mexicans reached a depth of 1,500 feet in three hundred years; we have gone down 3,000 feet in twenty years. With the rapid improvement of labor-saving mining machinery and engineering appliances, poorer veins than the Comstock will, in the near future, be worked as rapidly to as great and greater depths than the Comstock, and perhaps richer veins also, yet to be discovered throughout the vast extent of our mining regions. Moreover, the present law is an indigenous product, the legitimate offspring of our institutions and the peculiar circumstances of our own miners, based in great part upon their local regulations. It has undergone a gradual process of development and improvement by statutory enactments and judicial decisions, from the commencement of mining on this coast up to the present time. Such gradual amendment should continue to be made as experience shall show its necessity, but we should make no radical change from the present system, which is so well calculated to encourage and protect mining to the greatest depths attainable by the resources at our command.

19. The mining law should be uniform. I think all mining-district laws and customs could be advantageously abolished, leaving the mining acts of Congress alone; but the district recorders could hardly be replaced by the United States land officers, because new districts are constantly being found remote from settlements, and to abolish the office of district recorder would lead to inconvenience, confusion, and expense, which locators generally cannot afford. Certain changes in the mode of locating and recording, suggested in reply to question 21, would remove some of the objections to district records.

20. I think not, because very often, as compared with land contests, the questions to be decided are more complicated, the property in controversy more valuable, the evidence of possession, &c., is often conflicting, requiring to be sifted by a jury; the judges of the State courts are elected by the people, more directly amenable to them for misconduct, and generally better versed in the law than the local United States land officers, while appeals to Washington, which would constantly be made, would be more expensive and dilatory than litigation in the local courts.

22. I think the most practicable way to induce locators to apply soon for United States patent would be to lessen the expense of getting such patent. Publication of notice might in some cases be dispensed with, as suggested in reply to question 21. The price of the land is not much of an object to the government. It would be rather harsh, I think, to forfeit a claim for neglect in this respect.

21. The amendments I would suggest refer principally to fixing the locations, as follows:

*The location.*—The center line of the location shall be marked by a line of posts or monuments placed along the course and windings of the lode, as near as can be ascertained, said posts to be not more than 300 feet apart and within sight of each other, beginning at one end of the claim at a post marked the "beginning post;" said posts or monuments to be uniform in appearance and substantially erected to a height of at least 4 feet above the ground and conspicuously and permanently marked with the name of the claim; and each intermediate post shall also have marked upon it the distance in feet from the beginning post to that particular post; and the locator shall place upon the beginning post and maintain thereon, until United States survey of the claim shall be made and recorded as hereinafter provided, a memorandum, giving the name of the locator, date of the location, length of the claim, and distance from said beginning post to each intermediate post, also the width claimed on each side of the center line thus established on the ground; the location, to be filed in the proper district recorder's office as soon as possible, shall give all the data prescribed for the above memorandum at the beginning post and shall fix the position of said beginning post and such intermediate posts as may be available, by reference by distance and direction to near and prominent permanent objects; said notice of location to be signed by the locator and one or more witnesses, who shall testify to the fact of the

posts being set and marked according to law. Then, within one year of making such location, the locator shall procure a survey of his claim to be made by a duly qualified United States deputy mineral surveyor, who shall personally see to the placing of the corner posts of the claim under the regulations and instructions of the Commissioner of the General Land Office. The end lines of the claim must be at right angles to the course from the beginning post to the first intermediate post, except where the claim begins at the end of another claim upon the same vein, the end lines of which have already been fixed by United States survey, in which case the end lines shall coincide in direction with those of said prior United States survey; and also except where the claim embraces all the ground lying between two other surveyed claims, neither of which has been located by the present locator, in which case the end of his lines may be made to coincide with the end lines of such adjoining claims, it being understood that the center line of such United States survey must begin at the beginning post of the claim (unless said beginning post is within the limits of a still valid location described by a prior United States survey), and follow the line of posts set on the ground to mark the location for a distance not exceeding 1,500 feet, nor extending beyond the last post set on the location line, even if it is at a less distance than 1,500 feet from the beginning post, and although the location notice may call for 1,500 feet. It shall be the duty of the United States deputy mineral surveyor to file a copy of the plat and field-notes of such survey in the proper United States surveyor-general's office for his approval, without unnecessary delay, after he has been paid for such survey. And, after approval, no further survey will be required when the locator or his grantors apply for United States patent for the claim. The United States deputy mineral surveyor shall, after such approval, also furnish the owner a full and accurate description of said United States survey, for record by the owner in the proper county recorder's office. Until such record is made, any person otherwise qualified shall have the right to enter upon and take actual *bona-fide* occupation of whatsoever part of the surface ground embraced by such location as may not be actually occupied by the locator with *useful* mine workings or buildings, and may use such surface for any purpose whatever not conflicting with the locator's right to the precious metals; and the exclusive possession of the locator shall only extend to that portion of the surface ground not thus occupied prior to the record of said United States survey in the proper county recorder's office; provided, however, that the locator may, if he chooses, dispense with the preliminary location of the center line and initiate his claim by causing the above United States survey to be made. The date of the survey will then be the date of the location, and such date shall be the time when the corner posts are actually placed in position on the ground by the United States deputy mineral surveyor. Record is to be made in such case in both district and county recorder's offices. And in case such survey is made and recorded as directed within one year from the date of the location, the expense of such survey, to the extent of \$50, may be counted as part of the \$100 worth of "holding work" required by law for that year, the locator, however, to make his own terms with the surveyor regarding payment.

A penalty should be imposed for removing or defacing the posts of a United States survey of a still valid location.

Any party having an adverse claim to any portion of the ground included in such United States survey may bring suit in the proper court at any time within two years from the date of record in the county recorder's office of said United States survey, in order to determine their right to the ground in controversy; if they fail to bring suit within such period of two years their adverse claim will be barred, provided the posts of said United States survey have been kept standing in their proper places on the ground during that time, and conspicuously marked with the name of the claim and the number of the United States survey. An affidavit by the owner or his agent of continuous possession, with that of two witnesses of the fact of said United States survey posts having remained standing in their proper places during two years from the date of record of said survey, with certificate from the clerk of the court that no suit has been brought for any portion of said claim during that time other than what has been decided in favor of the applicant, and the usual abstract of title and certificate of work done, shall entitle him to United States patent, on payment for the land and the necessary plats and descriptions from the United States surveyor-general's office, without putting notice in the newspaper and on the claim as now required; but the claimant may have the option of publishing notice of application for patent at any time as heretofore.

Affidavits by the owner or his agent and two witnesses must be filed in the county recorder's office at the end of each year from the date of location, specifying the value and kind of labor and improvements (for "holding work"), and the precise locality upon the claim where such labor and improvements have been done; also, the date or dates when. And a failure by the claimant to comply with the regulations as to keeping memorandum on the claim, marking and preservation of posts and monuments, and record of affidavit of "holding work" done on the claim, shall render said claimant liable for

damages to any person who, without notice, relocates the claim or any part thereof, and is put to useless expense through the neglect of the aforesaid claimant.

No United States mineral survey shall be made over any portion of a prior United States mineral survey, unless the claim embraced by such prior United States survey be proved to be abandoned or forfeited, and personal notice or by publication shall be given to the claimant of such prior United States survey that a new United States survey is about to be made.

---

*Testimony of H. M. Atkinson, of Santa Fé, N. Mex.*

SANTA FÉ, N. MEX., *September 2, 1879.*

H. M. ATKINSON, surveyor-general of New Mexico, made the following statement:

I am in favor of retaining the rectangular system of parceling the public land. It is cheaper than any other system, and the settlers understand it. Owing to its simplicity, it is a very easy matter for them to find the corners if they are properly placed. I think the system can be improved. For instance, establish certain time points, either by astronomical observation or triangulation, for the sake of accuracy. If the points are not near together they could be more cheaply determined by astronomical observation. I would suggest that at perhaps every fourth township a very large monument of stone be placed, similar to those used for Territorial boundaries. They should be of some durable material, such as a metal stake, perhaps corrugated iron would be advisable, but the present system of subdivision and exteriors I consider preferable to establishing them by triangulation. I favor triangulation for the purpose of getting over deserts, mountains, or other obstacles where chaining cannot well be done or townshipping or subdivision is not desirable, yet keeping up the distances as though it had been done by chaining. My idea is to get something permanent, no matter what you may settle on. The system of triangulation is of course more accurate, but it would require a large additional expense to change the system, and then it is not only the direct expense, but it would be an expense to the settlers, for they would have to employ surveyors.

The wooden stakes now used are frequently destroyed by different means. The cattle rub against them and paw them down and they rot away. I think the monuments ought to be of stone or of metal or of something durable and lasting.

I would suggest another improvement. If the deputy surveyors would take into the field with them aneroid barometers and take the elevations and depressions, it would enable them to establish the contours of the country. It could be done at very little expense, merely the time and the cost of a barometer.

In order that the classification of the land into mineral, agricultural, arid, &c., as now required by law, should be more accurately made, I think a geologist competent to determine the character of the land should accompany each deputy surveyor's party. This geologist could be selected either by the General Land Office or the surveyor-general. The deputy surveyors under the present system do the work cheaper than it could otherwise be done.

All the land ought to be surveyed, for this reason: the classification which Congress makes results in this, that small portions or townships are surveyed (the arable portion or irrigable portion), leaving the balance unsubdivided and to be subdivided at some future time. It costs just as much to make a plat of a fragmentary part as it does to make a plat of an entire township. It makes double the work subsequently. Frequently men want it for the timber outside of the arable portion, or for grazing and. These grazing lands are of no earthly use for agricultural purposes, and there is no reason why they should not be surveyed and utilized for stock-raising. I think if I owned that land I certainly should want to receive some income from it. I would dispose of it to men who could utilize it, and the government should do business on the same principle. It gains nothing by holding these lands; they will not for many years become arable. Frequently we survey the whole exterior lines in order to get the inner boundary of a fractional township. The average cost of surveying the exteriors of a township is \$8 per mile, or \$190 to \$200 for the exteriors.

We have two classes of land, mineral and arable, and a considerable portion of irrigable land. There are from 3,000,000 to 8,000,000 acres of arable and irrigable lands unsurveyed, lying in every section of the country. Except by hunters and prospectors, very little is known practically of the southwestern portion of the Territory above Silver City and on through to the Arizona line. A good portion of this land in the mountains is timber land. Fine timber is also found on the mesas. There is mineral all through the Territory, though it is comparatively undeveloped. We have almost all the economic minerals: gold, silver, copper, iron, lead, mica, &c. There has been more substantial prospecting done in the last six months than has ever been done before. Wherever ledges have been struck valuable deposits have

been found. There ought to be some modification in the mining law. Do away with these district local usages and have one United States law or system of laws to govern all the mineral districts. There ought to be a law passed putting the filing of mineral claims in the hands of the registers and receivers of the various land districts, and then they should appoint deputies in those counties of districts that are a long way from the land office. The present law should be amended in this respect, and the record of these filings should be "noticed." The United States, in agricultural and other classes of land, retains the title to the land from the minute of survey till the issuing of the patent. Why should this not be the case with mineral land? It would simplify the whole matter to keep it in the hands of the government. As it is, one mining district has one set of rules, and another, right next to it, has a different set of rules, making it very annoying and giving rise to vexatious litigation. If the law was uniform everybody would get to understand it and become familiar with it.

Question. Do you know what the "apex" of a lode is?—Answer. I suppose it to mean where the lode appears on the surface, but I believe the courts do not so consider it. I think the claims should be confined to their side as well as their end line, giving each one 20.66 acres. As the mineral resources of New Mexico are just opening up, I think some legislation ought to be enacted to obviate endless mining litigation.

In regard to the pastoral lands I am in favor of having them surveyed, graded at price, and offered for sale at private entry in as large amounts as the purchaser desires, and yet for some reasons it might be well to limit the amount.

Q. Would you be willing to allow an actual settler to take up land sufficient to keep a herd that would support his family in the same way that a man is allowed to take up an agricultural homestead—a sort of pasturage homestead?—A. I should think that a very good thing, though I never thought of it before.

There is one thing I should like to speak of. I think the small Mexican settlements occupying little tracts of land along the streams, as they do now, ought to be protected; and in order to protect them in their rights I would provide that they should either take it as town sites or else they should pay for the land as other people do, in legal subdivisions, which could be again divided into subdivisions of 40, 20, 10, or even 5 acres, to accommodate the small owners, or else divide them up in such a way as would least affect the present boundaries of their claims. I would not, however, destroy the regularity of the present system of surveys. These people have no title from the United States to their lands, but they have lived there a long time, were the original owners of the land, and they should be protected.

Q. At what price would you sell the pasturage land?—A. It depends altogether on the proximity to water. They should be graded, perhaps, from 25 or 30 cents to \$1.25 per acre. This grading could be done on the classification made by the deputy.

The water rights are not all taken up in this Territory. There are plenty of water rights which could be taken on the Pecos. There is sufficient to irrigate with on that stream. In so far as the country is settled the water is taken up, but all the country is not yet settled.

The proportion of agriculture to stock-raising is about one to four in favor of stock-raising as against agriculture; that is, as to the value of the product. As regards the capital invested, I think that there is about \$20,000,000 invested in stock-raising against \$4,000,000 or \$5,000,000 invested in agriculture.

Of late there has been a very perceptible increase in agriculture and there has also been an increase in stock-raising. They are bringing stock in here from California, Texas, and other places, and these pasturage lands are becoming very desirable. They will bring almost as much for that purpose as they would ordinarily for agricultural purposes. I consider 30 acres of land a liberal estimate for preparing a beef for market, and one beef will equal five or six sheep. There is room for more cattle here yet. millions of acres are still unused. This year has been an unusually dry season, but the rainfall here last year was nearly 16 inches; at Mesilla it was about 8 inches, and at Silver City it was between 16 and 17 inches. This was a little dryer than the season before I came here. This year there has been a perceptible decrease, but the general rainfall seems to be increasing. From the suppression of the forest fires the vegetation is, I think, increasing. There is a great deal of timber here; the mountains, foot-hills, and mesas are covered with pines, aspens, cedars, &c. These timber lands are not much injured by depredations, and a great degree of caution is exercised by the people in regard to forest fires.

Q. What disposition would you make of these timber lands?—A. I would sell them. I can see no advantage in holding them. I would sell them under the present legal subdivisions in any amount a man wanted, for if I wanted 1,000 acres for milling purposes I would get it in some way. I do not believe a graduated method of cutting the timber could be established here, though I think everything possible ought to be done to encourage the growth of the timber. I think the supervision of the timber lands should be placed in the hands of the register and receiver, as they are right on the ground all the time and can exercise a more intelligent jurisdiction over it than any one else.

They could administer the laws better than an outside agent. There is a much larger cope of this country that is capable of agriculture than is supposed. My impression when I came here was that a very small part of it was fit for agriculture; but the prospectors in the south and west are showing up considerable areas of arable land.

Q. How would you prevent this land from being taken up as pasturage land at a low price?—A. I would reserve the arable portion from private sale and dispose of it under the homestead law. I would abolish the pre-emption law.

Q. Why?—A. Because the homestead law has a pre-emption feature in it already.

Q. How could you classify the land?—A. That could be done by the deputy surveyor and the geologist, who should be appointed to go along to classify the land.

Q. And how could you determine just what was irrigable land?—A. Wherever there was water accessible the surveyor would know that so much of the land near by was irrigable.

Q. And how could you make a practical division so that these gentlemen here by looking on this map would know what is irrigable and what is pasturage?—A. From the information collected by the surveyor in making his plat, I would have the draughtsman simply note—say, here is a section—I would have him note that this 40 acres is arable, at \$1.25 per acre; this 40 acres is timber, of commercial value, so much per acre for that; and that 40 acres is, perhaps, grazing land; and another 80 acres may be arid or be mesa land. In subdividing they run around the entire section, and they can form a pretty good opinion of the entire section from the observations they then make.

Q. You would have this classification made by the deputy surveyor and the geologist appointed to go along with him, who would measure the streams and determine how much water there was in them annually, and then mark the limits to where the water could be carried?—A. I think he could determine that approximately by his eye. If he made a mistake and it is not arable, still I should classify it as arable, for there is a probability of its being so. I require them to measure the streams now, and their notes show everything—the depth, height, &c.

Q. Suppose it should turn out that there is not water enough for all this land that you have determined to be irrigable, and you sell it to citizens of the United States, and it turns out afterwards that there is not enough water?—A. Well, it is their lookout. If they buy something and pay \$1.25 for it, and it does not turn out as they expected, it is their lookout.

Q. But you classify the several pieces of land for the citizen?—A. The citizen should go and make an examination beforehand.

Q. If the government undertakes to sell a piece of land as irrigable, the government ought to know whether it is irrigable or not, and it takes the money of the citizen under the supposition that it is irrigable, does it not?—A. They do under this system.

Q. Suppose a man buys land low down on the stream as irrigable land, and pays for it; along comes another man who buys land higher up and takes all the water. How would you arrange that?—A. That is something I have never thought of.

Q. What is your present law of water rights here? Does the first man who occupies the land take all the water, returning such as he does not need to the stream again?—A. Yes; that is the local law here, I think.

Q. Do you think that there will be any difficulty in adjusting these conflicting interests and conflicting rights?—A. There might be eventually, perhaps, something of that kind. You cannot have any general law that will not operate harshly in some instances. When the government makes this classification of land I go down there to make my settlement near the mouth of a stream or valley. I take my chances of settlers coming in above me and absorbing a good portion of the water. That is something I don't think you can regulate. You can only have a general rule that the water shall not be wasted.

Q. Why should the government not sell a man the water right, when it sells him 160 acres of irrigable land? It is known how much water is wanted for a certain quantity of land. Why not let this water right run with this land forever? If the government finds that it has not enough water in the stream, let them stop selling the land as irrigable land, and sell the balance as pasturage land.—A. Perhaps that would be a good idea. I have not given that subject any consideration, and can only jump at a conclusion.

Q. Do you think a general system of irrigation ditches could be constructed in this Territory with profit?—A. I think they could in some sections—on the Pecos and Rio Grande Rivers. There is an immense area that can be irrigated there.

Q. Does it destroy the land or improve it?—A. Irrigation improves the land; it enriches the soil.

Q. Does it increase or destroy the growing capacity of the land, year by year?—A. That I cannot say. They have raised here, for years and years, crops, without fail and without fertilization.

Q. Don't the grazing capacity of the land decrease, year by year?—A. That depends on the size of the herd.

Q. If the land is well stocked, does it not take more grass to graze that herd each year?—A. Yes; I think it does.

Q. Are there conflicts between the sheep and cattle men?—A. Yes; all the time.

Q. Where do you sell your stock?—A. In Chicago, Kansas City, New York, Boston, and England. It is driven right to the depot and shipped.

Q. Can grapes be grown in New Mexico?—A. Yes, sir. I think this Territory will be one of the finest grape districts in the country. It will be the Rhine of America.

I should like to say a word about the Spanish-Mexican grants. There are about 140 such grants filed in this office and others are being filed every year. Just how many exist I cannot state. They are coming in all the time. They date back into the sixteenth century. Now, I think the rights of the parties holding these grants should be settled and the remainder turned over as public domain, so that when settlers come in here they will know whether they are on government land or grant land, and the improvements they have made, often of value, will not be jeopardized. This should be settled immediately. There ought to be a limitation fixed by law for the filing of the claims and proving up.

---

*Testimony of W. H. McBloome, of Santa Fé, N. Mex.*

SANTA FÉ, N. MEX., September 3, 1879.

W. H. MCBLOOME, deputy surveyor, made the following statement:

I think the system we have at present is very simple and effective. The permanent stakes of stone or iron would last longer than the wooden stakes which are used at present, and would be very much better, but they would probably cost more. If it is desired to reach a remote point from one whose position is known, and it is not desirable to survey the country between the two points, triangulation can then be used to advantage. A much better grade of work would be done under the present system if the pay was better. There is not a sufficient amount paid for running the lines. I object to any change, because I think we are now getting the best possible survey for the money paid. It is simple and easily understood by the people. There are very few surveyors who run outside of the limits of error. We are allowed 300 links for error in townshiping and 100 links in subdividing. The surveying could be made more accurate by cutting down the amount of allowed error 50 links and by increasing the price for the work done.

---

*Testimony of John C. Davis, register land office, Santa Fé, N. Mex.*

UNITED STATES LAND OFFICE,  
Santa Fé, N. Mex., September 2, 1879.

*To the Land Commission:*

My duties as register of the land office at this place has called my attention to the land laws and their workings, to the climate, water supply, and the different grades into which the lands of this Territory are naturally divided.

First. The greatest present want of the Territory is to have the private lands (which consist of Spanish and Mexican grants) segregated from the public domain, and to this end would recommend the immediate passage of the bill introduced into the Forty-fifth Congress known as Senate bill No. 376, limiting the presentation of claims to three years, and after that time forever barring them. This would leave the government 50,000,000 acres of land or more for settlement. This accomplished and a liberal appropriation for surveys we should get along very well with few exceptions under the present laws, but would recommend radical changes in the laws for the disposition of the public lands in this Territory, notably the repeal of the pre-emption law and the act of March 3, 1879, requiring notice and publication before final proof in homestead and pre-emption cases; would retain the homestead law with the pre-emption feature or right to commute, and increase the homestead privilege to 320 acres and allow any number of filings desired by the applicant, he each time surrendering his receipt with the proper relinquishment indorsed thereon, but would confine him to one final proof and patent. I would recommend the continuance of the desert-land act of March 3, 1877, as well adapted to these people and country, and the construction of the law should be liberal. I see no reason why a man should be compelled to irrigate every foot of a section of land, when it will suit his purposes better to use it as a grazing farm and introduce water accordingly.

Second. The physical characteristics of this Territory are such as to make a classification of the public lands a necessity; would recommend they be classed as arable.

irrigable, timber, pasturage, coal, and mineral lands; the arable lands I would dispose of in tracts of, say, 3,000 acres at 10 cents per acre; the irrigable lands, I see no reason they should not be sold at \$1.25 per acre; timber lands I would sell in 160-acre tracts at \$2.50 per acre; pasturage lands in unlimited quantities at 25 cents per acre. I am not prepared to say I would change the present coal-land laws. The mineral or mining laws should be greatly condensed and simplified; miners' camps and local customs done away with; a law so plain everybody could understand it, and all initial and other filings should be made in the district land office and nowhere else. The present area, 600 by 1,500 feet, I think ample.

JOHN C. DAVIS, *Register*.

*Testimony of John C. Davis, Santa Fé, N. Mex.*

(Copy of Senate bill No. 376, for ascertaining and settling private land claims.)

SANTA FÉ, N. MEX., *September 2, 1879.*

JOHN C. DAVIS, register land office, made the following statement:

Question. Have you any suggestions to make concerning improvements in the present method of surveying the public land?—Answer. I think there might be improvements made. I should heartily concur with the suggestion that we have an expert, a geologist, or any very competent man, with the survey and that the land should be properly classified and entered on the plats filed in this office, in order that the register might at a glance know just what kind of land there was in a township. As for these corners, I would suggest that they should be made of some very durable material and put up in such a way that settlers could find the quarter-section corners without trouble.

Q. Do you have many complaints on that score?—A. We have had a dozen men here who were at a loss to know whether they were on surveyed or unsurveyed land, and upon examination we found that the stakes had been destroyed. The result was that in order to determine where they were, they had to hire a surveyor at a cost of \$10 per day.

Q. Don't you think that the forms now used in homestead and pre-emption cases could be immensely simplified?—A. I do.

Q. Don't you think that pre-emption proofs, that is the entry, could all be combined upon one sheet of paper?—A. Yes, sir; I do. I think the three affidavits could be put upon one sheet. I think also that the provision about speculation, &c., is all humbug. The pre-emption act, too, ought to be abolished, as the homestead has already a pre-emption feature in it. It would simplify the matter very much. The amount of homestead land should be increased. I would make it 320 acres.

I am decidedly opposed to the affidavits and notice of intention to prove up. I will show you an instance. Three Mexicans came in from San Miguel County, a distance of 150 miles, at a cost of \$50 to \$75 apiece, to prove upon their homesteads. I had to tell them, "There is a new law; you cannot prove up; you must send me a notice, and then you can give me \$5 or \$10 to pay the expense of printing that notice for five weeks, and then you can come back and prove up if there is no adverse claim." I do not believe that the affidavits or "notice" prevents perjury but increases it.

There is another thing I should like to speak of. We have plenty of cases on the books here where homesteads were entered in 1870, and they stand intact on the books to-day. I wrote to these parties but I could not get any response from them. I could not cancel them although there were people who would like to have filed on the land. I cannot cancel them even now till I get notice and know what they propose to do. They probably moved out of the county years ago but the land stands on my books as occupied. The probability is that half a dozen men have been on the land in the mean time.

Q. When you have the proof of the abandonment or relinquishment of a homestead you send it to Washington, do you?—A. Yes, and about a year from that time we get a return from Washington—the cancellation of the abandoned homestead. In the mean time the land is occupied by the person who has bought the home of the person who abandoned or relinquished it. That man ought to have the preference to anybody else and this is our ruling in the case of canceled homesteads, but that is not the ruling of the department. When the cancellation is made a certain time ought to elapse so as to allow the incumbent of the ground an opportunity to make his claim. Under the present law I must get a return from Washington before I can sell it. Now, I get a notice of cancellation; a man comes in here and makes application for entry on that land; I accept his entry but next week a man says I was living on that land before the cancellation was made and before that man filed on it, and he has never lived on it. In that case I should be inclined to think that the man who has lived on it should be entitled to the ground. But it is not law; still I think it should be so. I know of one

case in Washington where a cancellation was made and a man was living on the ground, but another man slipped in and made the entry, thus depriving the man who lived on the land from making title, and the department ruled in favor of the man living on it. I think the right to cancel it ought to be in the hands of the register and receiver as they are the persons best capable of judging, as they are right in the locality. I think, too, that the register ought to be authorized to go out of his office to take proof and testimony, especially here where the districts are so large. I had permission procured from the department to go down into Colfax County and it was of great convenience to the people. It is very expensive for poor men to come away here in order to make their proof.

In the case of pre-emption, settlers are allowed to prove up in six months, and they are also allowed thirty months. I think the register should be allowed to declare forfeited any pre-emption entry of thirty months' standing, the parties, of course, having received due notice.

Q. What good reason is there why a man should not file one-half dozen times until he makes at last a final entry and proves up?—A. None. I think a man ought to be allowed the homestead privilege until he finally makes a permanent homestead. There is no damage done if he does not consummate his claim. I think he should be allowed to file till he gets a home, for this is the object of the law.

There is a good deal of what we call agricultural land in this country, in our district. We have some fine rivers and bottom lands. There are large tracts of arable land that can be made useful by irrigation still left in this country all along the Pecos River, and in the upper portion of the country, in the San Juan district, there is as fine farming land as there is in the Territory. There is plenty of water. I am told that in the Animas Valley the settlers have filled up the township. Irrigation, of course, increases the bearing properties of the soil; at least it is said by those who pretend to know that it is equal to manure, and as an evidence there is land along the little Santa Fé Creek that has had a crop of corn every year for 100 years, and there is no diminution in its fertility.

Q. How much of the land in this district is pasturage land?—A. I should say that three-fourths of the land in this district is pasturage land, and about one-half of the total acreage of the Territory is in this district. If a man has 200 head of cattle he is bound to have 3,000 or 4,000 acres of land. Senator Dorsey owns all the springs on 160 acres, and this controls the whole 10,000 acres back of it. I think he would buy all the land if he could get it for 10 cents per acre. I think there is much of the land here that ought to be sold for 10 cents per acre. I would grade the land at 10 cents, 50 cents, \$1, and \$1.25 per acre. The classification on the maps would be the basis of this graded price. I would sell the pasturage land in as large quantities as the purchaser desired. If a man will take that land at any price you are pleased to name and put large herds of cattle on it, it is doing somebody some good, and perhaps there is no other way the land can be utilized. I think the men who are there now should be protected and have the first chance to buy land in proportion to their herds, otherwise the cattle men would be broken up. Twenty acres of land will do at one time and 30 acres at another time to support one beef. I do not think 30 acres too much as an average acreage for one beef.

Q. Do you favor the pasturage homestead?—A. Yes; I would be in favor of the pasturage homestead giving 3,000 acres to each actual settler. There are some water privileges left, and there is land with springs on them. I believe as Mr. Atkinson does, that the Mexican and Indian should be protected in their claims by making smaller subdivisions.

Q. What are your views in regard to the timber land?—A. I would sell the timber lands in limited quantities. I would not give any man over 160 acres of timber land, but divide them around; \$2.50 an acre would be a fair price for timber land. I would protect the timber to the fullest extent possible. It would be well to make a limitation to the amount to be cut off, if you could enforce it; but I cannot see how you could. I would limit the quantity, that it might go to as many persons as possible. The registers and receivers in the various districts should have jurisdiction over the timber lands, as they have over every other class of land. He could stop depredations, &c., better than any one else. I think the law ought to be changed in that respect, and I think everything possible ought to be done to check the squandering and wasting of the timber.

Q. What suggestions have you to make concerning the mineral lands?—A. I don't know much about the mineral lands; but I think if a man has a mineral claim he ought to be allowed to follow the lode throughout its "dips, spurs, and angles." I think the register and receiver ought to receive the first filing of a mineral claim, and should exercise the same control over the mineral lands as he does over the other classes of land. In this Territory any number of men are allowed to make a mining district. I think that ought to be done away with. There ought to be one general, sweeping law regulating all mining matters. The present United States law allowing each man a mineral claim of 20.66 acres I think is sufficient.

Q. What have you to say in regard to sheep?—A. Concerning sheep, I think five sheep equal to one beef. Sheep and cattle men are conflicting all the time. Bloodshed often results, and I think there will be more of it if the matter is not settled. I think it would be decidedly to the advantage of the whole country if these matters are settled at the soonest possible day. Cattle men say that sheep ruin the country by running over the range ten times as much as they do. My observation confirms this opinion. I have known beautiful ranges of grass utterly destroyed by the treading of sheep.

Q. Can you suggest any improvement in the matter of water rights?—A. I do not see how the water-right matter can be improved. Of course a man should be compelled to return to the stream all the water he does not use. In regard to the land grants I would simply say that Senate bill No. 376, introduced at the third session of the Forty-fifth Congress, should be made a law at the soonest possible date.

---

*Testimony of N. Gales, merchant and miner, Hillsborough, N. Mex.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. N. Gales, merchant and miner, Hillsborough, N. Mex.
2. Five years.
3. None.
4. I have had some experience in Minnesota.
5. Uncontested case two years.
6. I think the homestead and pre-emption law in its simplest manner as to entries and final proof is better than imposing so large an expense upon the *bona-fide* settler, as now seems to be the case. So large amount of proof papers, six weeks' advertising, &c., costs the settler money he is not able to bear, and but little good can result from this extra expense.
7. Mineral and pastoral lands.
9. I would suggest that no lands be surveyed except needed for use, such as the valleys for agricultural purposes and some lands that were needed around villages, which seldom are surveyed on account of smallness of tract.

**AGRICULTURE.**

2. September or October.
3. None.
4. One acre in 200,000.
5. Corn, wheat, barley, and fruits.
8. Richness has increased.
9. Very little water here.
10. All for mining purposes.
11. None as yet.
12. Nearly all.
13. Six hundred and forty acres to the settler.
14. Homestead only where it is not mineral.
15. Five acres.
16. One hundred.
17. About five.
18. About the same.
19. No fences; could be confined.
20. No.
21. Very limited.
22. Seven.
23. Diminished.
24. Not very well.
25. Very few here.
26. One hundred to one thousand.
27. I would suggest that the water courses be immediately surveyed, so men can improve their claims without infringing on others.

**TIMBER.**

1. Very little here; what there is is on the mountains.
2. No timber planted in this section; no agricultural lands, all mineral.
3. Cost more to survey the mountains than could be realized from the sales.

4. Only one class here; few pines in the mountains.
6. Fires will stop when the Indians are driven out.
7. Very little timber here; what there is is immediately needed for mining and building purposes; no unnecessary waste, only by Indian fires.
8. Custom is here to take timber wherever it can be found for actual use.
9. We need no law to regulate the cutting of timber here. I have no interest in any mill or the cutting of timber.

## LODE CLAIMS.

I am interested in lode claims and think the laws are very good, which give general satisfaction here.

## PLACER CLAIMS.

1. Gold mostly, some silver.
3. Without contest, \$300; with, \$500.

*Testimony of William Krönig, farmer, La Junta, Mora County, New Mexico.*

The questions to which the following answers are given will be found on sheet facing page 1.

*Public Land Commission, Washington, D. C. :*

GENTLEMEN: Having received a circular directing my attention to an act of Congress prescribing the duties of your honorable Commission and requesting replies to such interrogatories as may be within the range of my personal information, I comply with your request, and will give the most special attention to such questions as appear to me from my observation to affect this district particularly.

1. My name is William Krönig; occupation, farmer; residence, La Junta, Mora County, New Mexico.
2. Since 1849.
3. I have not.

## AGRICULTURE.

1. The cultivated part of Mora County varies from 6,000 to 8,000 feet in altitude; the rainfall is the greatest in and near the mountains, where frequently irrigation is not necessary to raise good crops. The length of seasons varies with the altitude, and in the higher portion frosts in the latter part of August are not of uncommon occurrence. Our supply of water for irrigation depends upon the snowfall during winter and spring in the mountains, and agriculture without reservoirs is limited to the first and second river bottoms. The agricultural area can only be extended by a system of reservoirs, as, with few exceptions, there is hardly a season when we have a fair and sufficient supply of water for our growing crops.

2. We have frequently light rains in the months of March and April, but our rainy season generally commences in the latter part of June and continues in showers during the months of July, August, and September, and sometimes later. The rains do the greatest part of good to corn; for small grain they would be better earlier.

3. Only a small portion of the valleys and glades (situated in the mountains) can be cultivated without irrigation.

4. One-fiftieth part can be cultivated by irrigation.

5. Wheat, barley, oats, corn, pease, beans, tobacco, vegetables, and orchards.

6. The land in common seasons is thoroughly watered before plowing. When the wheat has spread out and covers the ground it is irrigated again, and the last irrigation applied when the wheat is in blossom. To give a correct estimate of the amount of water used is out of my power. To water 100 acres in this district a supply of about 160 inches (miners' measure) is needed for the first watering for fifteen days; to water the wheat it will take about twelve days, and the third time about ten days.

7. The sources of water come from our mountain streams, and the supply is altogether dependent upon the snowfall in the winter. The natural supply is in many seasons insufficient for the land now under cultivation, and only a proper system of reservoirs could increase the agricultural area. In this county we have now seven reservoirs, and if this system should be enlarged (facilities are not wanted) thousands of acres could be made to yield good crops. The evaporation is immense, and if the people could be induced to set out trees on the streams and ditches the supply of water would be considerably increased.

8. Irrigation has a beneficial effect on land generally, as the water contains salts in solution and also sediments from the mountains which serve as manure. In lands containing many salts (alkalies) irrigation will bring them to the surface and make

them unfit for agriculture, but those are exceptional cases. Lands have been cultivated in this Territory for one hundred and fifty years and upwards without any manure, and their whole system of rotation consisted in planting corn one year and wheat the next, and still these lands produce very fair crops. Wheat is grown up to an altitude of 7,500 feet; potatoes and oats as high as 9,000 feet.

9. Each main irrigation ditch has a foreman, who gives out the water either to those who need it most or by rotation for days, or even for hours in seasons of scarcity. Each ditch empties at its terminus into the river, but it depends entirely upon the season as to the quantity returned to the river. Our local laws are very insufficient to give each landholder a just proportion of water contained in the streams, as those who live near the sources of the streams take advantage of the water without having consideration for those living below them.

10. It has been all taken up.

11. In dry seasons serious collisions among claimants.

12. Forty-nine-fiftieths.

13. In my judgment homesteads on pastoral lands should be divided into three classes. To those who locate on streams where only a small portion of the land can be irrigated, 320 acres should be allowed. Those who depend on springs, permanent water holes, or lakes, from which no water can be obtained for irrigation, should be allowed 640 acres. Those who live remote from any water course, springs, permanent water holes, or lakes, and where water only can be obtained by digging wells, should be allowed 1,280 acres.

14. Lands situated on water-courses, and subject to private entry, should be limited to a section to each purchaser in a square body, according to legal subdivision. On pasture lands remote from any water course, where water can only be obtained by sinking wells, one township.

15. It would take in this section 10 to 15 acres of pasture land to raise one beef, and I believe it would be a fair average of this Territory.

16. Sixty head.

17. Where cattle are only permitted the grass has held its own. Where goats and sheep are grazing, it has diminished.

18. Up to the present very little fencing has been done. Cattle ranging on the prairies in storms would seek shelter in timber and would break through any ordinary fence.

19. Cattle will do better on their accustomed ranges than to move them from place to place.

20. Streams, lakes, water holes, and springs.

21. Four sheep are equivalent to one beef in eating and destroying the grass, as they generally range in herds from 2,000 to 4,000 head.

22. Diminished.

23. A constant strife between the different owners, as cattle will not do well where sheep are herded.

24. I cannot answer the first question. Sheep are herded in bands from 2,000 to 4,000 head, and cattle from 50 to 3,000 head.

25. I am not familiar with this subject.

26. No.

#### TIMBER.

1. The timber lands of Mora County are about one-third area—pine, red and white spruce, piñon, white and red cedar, oak, cottonwood, and aspen.

2. None worth mentioning.

3. I consider it best that the mountain timber lands should remain public domain, as the agriculture of New Mexico depends upon the supply of snow which accumulates during winter and early spring, and if the mountains should be deprived of their timber, which would be the case if sold, the snow, losing the protecting shade of the evergreens, would come down in torrents, and the water supply would be exhausted in the beginning of the season. In view of the fact that the greater part of the mines are situated in timber lands, limited amounts might be sold in lots of 40 acres, with a limited time for clearing. Due notices of a proposed sale should be published, specifying the location and extent, inviting bids for each lot of 40 acres, reserving the right to reject any and all bids for the same.

4. I would not.

5. There is a second growth of timber, but extremely slow.

6. The forest fires are generally caused by carelessness, and sometimes are started by Indians. There is a heavy penalty imposed by Territorial law, but I am not aware of any charges under the law. Miners and farmers use the public timber on public lands as common property, and there is not much waste from this source. Depredations committed in supplying saw-mills and cutting railroad ties have not come under my observation.

8. The local custom is to help yourself to what you want for fuel, fencing, and building purposes. The question of the acts of corporations I am not familiar with.
9. I think it would.

Respectfully, your obedient servant,

WM. KRÖNIG.

*Testimony of William McMullen, civil engineer, New Mexico.*

*Public Land Commission, Washington, D. C. :*

GENTLEMEN: Having received through the office of the surveyor-general of the Territory a circular directing my attention to an act of Congress prescribing the duties of your honorable Commission, and requesting replies to such interrogatories as may be within the range of my personal information, I will cheerfully comply with your request, and will give the most especial attention to such subheads as appear to result from my observations to affect this Territory particularly.

1. My name is William McMullen, civil engineer.
2. I have lived in the Territory since 1862—seventeen years.
3. I have never acquired, or sought to acquire, title to any of the public lands of the United States.
4. My impressions are formed from observations that have come to my notice while engaged as civil engineer, United States deputy and mineral deputy surveyor.
7. The surveyor-general's office can doubtless furnish the most extended and reliable information in reply, although the description given in the notes returned by the deputies who executed the earliest surveys in the Territory are in some cases very defective. I will hereafter refer to an instance.

AGRICULTURE.

14. In my judgment the lands put in market for private entry should be limited in quantity to each purchaser. It is a common practice in this Territory to enter the smallest legal subdivisions bordering on streams, with a view to speculation and to secure the public land adjacent thereto for grazing purposes without purchase. A notable case is that of Wilson Waddingham in his entry of land bordering on the Canadian River, and Ute Creek. See his advertisement hereto attached :

[Las Vegas Gazette.]

“Waddingham post-office, La Cinto, San Miguel County, N. M.; range, Montoy's Grant, N. M.

“NOTICE.

“All persons found trespassing by herding sheep or cattle on Ute Creek within boundaries of the mouth of said creek and for a distance of sixteen miles on both sides said creek, and also on Canadian (or Red) River from the boundary line of the Beck location No. 2 for a distance of sixteen miles on both sides down said river, will be prosecuted according to law.

“WILSON WADDINGHAM.”

Another notable case is that of the private entry of land in townships 14 and 15 north, range 8 east, known as the Cerrillos mines. This, however, presents a different question. The United States deputy who executed the survey failed and neglected to report any mineral indications, giving only a meager description of the same, although many old excavations for mining purposes were plainly visible at various points. A large portion of this land has been entered by different persons at private entry, and includes what is supposed to be the best mines. This has caused delay in developing the mines, and time only will reveal what other difficulties will arise therefrom.

28. Yes. This I will notice hereafter.

PRIVATE LAND GRANTS.

The prompt settlement of title to private land claims is a question of the utmost importance to this Territory. The delays attending the present system were stated to Congress last winter by Hon. Mariano Otero, our present Delegate. Unless some measures are adopted to facilitate a settlement of this question, the claimants or heirs cannot be

to realize much benefit from their possessions; the majority are poor and unable to fee an attorney to prosecute their claims, and are therefore compelled to dispose of the greater part of their lands to obtain title to their small homesteads, or to sell out their claims for a mere trifle. This opens a field for capital to monopolize large tracts of the best land in the Territory. I might cite many reasons which present themselves to my mind why land monopoly should be checked, but it might appear presumptuous in me to do so; I will, however, remark that nearly all these grants are located on water courses and extend in many cases to the sources of the streams which rise in the mountains. The private claim of many miles on a stream of water from its source would be a serious obstacle to enterprise, which might seek to divert water from its natural channel to irrigate distant table lands or to prosecute mining operations. In my opinion, every facility should be afforded to enable the grantees or their heirs who are actual settlers to perfect their title without delay.

I would not be understood, in recommending increased facilities to grantees or their heirs whereby they might be enabled to retain their proportion of large grants, as making any exceptions to those who have acquired title by purchase.

The interest of the Territory, including all classes, demands a prompt settlement of title to private lands, and their segregation from the public domain, without cost to the claimants, as stipulated in the eighth article of the treaty of Guadalupe Hidalgo. Until this is done, settlement and improvement will be retarded.

Sales of private land by the government have caused hardship; also distrust of title to lands offered as public lands. This cannot be avoided until the private lands are segregated from the public domain.

The description of boundaries generally given in the title papers to private land grants are extremely vague and indefinite, and notwithstanding the most diligent investigation and thorough examination of testimony, the result is often obscure and unsatisfactory. Landmarks named or designated as boundaries, such as hills, springs, mesas, arroyos, &c., are sometimes found to constitute the boundary on a different side from that named in the description. The distances from point to point, as estimated by witnesses in proving title, are seldom approximative.

When the deputy surveyor enters into a contract to execute the survey of a private land claim he receives his special instructions from the surveyor-general, based on the record filed in his office, including a copy of the plat filed by the claimants or their representatives. As the records are known to be unreliable, the deputy is instructed to notify the claimants or their representative of the time when he will be prepared to run the boundary lines to the claim, and request the attendance of his witnesses to establish the same. The testimony of the witnesses is required to be taken before and certified to by a civil officer who is authorized to administer an oath; the deputy is required to establish the boundary lines on this testimony, his own observation of the boundary calls, together with the special instructions, and if any discrepancies occur in conflict with special instructions he is required to explain why the deviation was made. This is not always satisfactory to the surveyor-general, and I will add, nor is it to the deputy himself. Sometimes the deputy is instructed to return and change some part of the lines established. I entered a note in the general description of the survey of the "Cueyamungue grant," situated in Santa Fé County, which I executed under the contract of Griffin & McMullen, dated August 10, 1877, in which I comment upon the difficulty of complying strictly with special instructions. Your attention is respectfully invited to the same.

I would suggest as a remedy that a commissioner be appointed with authority to administer oaths and to compel the attendance of witnesses, whose duty it shall be to go upon the ground and to summon such witnesses as he may think proper, to identify the boundary calls of the claim and to file the testimony taken by him in the office of the surveyor-general, whereby definite instructions could be given to the deputy surveyor, and the approximate extent of the boundaries known.

I would also suggest that claimants or their representatives be supplied with a copy of notes or plat of survey on application to the surveyor-general, and the payment of the cost of copying. Without this information the claimant cannot determine whether he will accept the boundaries established or make an appeal for a change or correction of any part of the same.

#### LODE CLAIMS.

1. My information on lode mining is very limited, and confined to observation mostly in this Territory.
2. The principal defect appears to me to be the recognition of State, Territorial, and local regulations.
3. Such a case has not come within my observation.
4. The top or apex I understand to be the summit, comb, crest, or highest point on the ridge of a vein or lode. The top or apex, the course and angle or direction of the dip, cannot always be determined in the early workings of the veins or lodes.

5. The intended rights of a discoverer are not properly defined, and cannot be protected while local regulations control the conditions of location.

6. Yes.

7. No.

8. My observations have been confined to the early working of lodes.

9. I have not observed any outcrops of lodes wider than the legal width of claims as defined by these several authorities.

10. The outcrops of narrow lodes sometimes deviate so far from a straight line as to cross side lines which are run straight. The outcrop seldom extends throughout the length of a claim, and side lines are sometimes laid off on angles from float indications of the course of the vein.

11, 12, 13, and 14. From information gathered from Leadville miners, and from having read some of the decisions rendered by the courts, I do not feel justified in expressing an opinion on those points.

15. In this Territory on two occasions, viz, at the Moreno mines in Colfax County in 1866, and at the Cerrillos mines in Santa Fé County in March, 1879. To organize the Moreno mining district a meeting of the miners was held at Elizabethtown in compliance with a request of many miners duly circulated, which meeting was attended by about 40 miners. A committee was appointed to draft rules and regulations governing the locating and working of claims; also, to define the boundaries of the district. The report of the committee having been duly considered and adopted, a recorder was elected, who was required to keep a record of all miners' meetings, and to record all notices of mining claims presented to him for record, on the payment of a stipulated fee, &c. In a short time after the organization, in a dispute over a mining claim, one of the parties notified the other that a miners' meeting would be called at a specified time to decide the question. The meeting was held, and decided in favor of the original locators. The "jumpers" declined to accept the decision, and called another meeting, which decided in their favor, as many of the miners declined to attend a second time when they had already given a decision. It was then proposed to carry the case into court, and the party was advised that a suit could not be maintained except through a lease of the title of the grant owner, in whom the title was vested.

The Cerrillos mining district was organized on the 27th day of March, 1879, at a meeting of all the miners known or supposed to reside in the district, some eight or nine in number. The rules and regulations, based upon the mining laws of Colorado, were proposed, discussed, and adopted after general discussion, and the boundaries of the district defined by the lines of public survey—townships 14 and 15 north, ranges 7, 8, 9 east. A recorder was also chosen, whose duties were defined in the regulations, viz, to provide the necessary books in which to enter the proceedings of all miners' meetings, the record of mining claims, deeds of transfer, and also to supply certified copies of the record on application of parties interested and the payment of a stipulated fee, &c. No other officer elected.

A few days after it appeared that a district had been organized within the limits of the Cerrillos mining district prior to the 27th of March, 1879, and called the Galisteo district. Each district ignored the existence of the other, and the Territorial law specifies that every mining claim shall be filed for record within ninety days after location, and that no other record shall be required.

16. The general method of locating a claim is to post a notice describing the location, giving the supposed course of the lode, and the distance from the notice claimer in either direction; also, the width on each side, the names of the locators, and the date of location. The record is a matter of after-consideration, and by some ignored entirely, those who claim that evidence of possession and continuous or periodical working of the claim in accordance with local regulations renders recording unnecessary. There is usually no time specified within which a claim shall be recorded under local regulations. Parties making locations with a view of speculation, or of selling their claims, secure a certificate of their locations by recording notices as evidence of their title, which is sometimes questionable. A local record is, however, advantageous for reference, that strangers and others may ascertain the situation, and who are the claimants and what are their respective interests. It is, perhaps, needless to say that the conflict between the Territorial laws and local rules and regulations creates much confusion.

17. I am not aware of any provision for amendment, Territorial or local.

18. No.

19. Yes.

20. Yes.

21. I "consider it desirable to retain the leading features of the United States mining laws," and I "believe that the practice of following the dip beyond the side line of a claim" can be satisfactorily maintained by drawing and defining the distinction between a lode and a deposit. I would favor a repeal of the authority delegated to States, Territories, and local mining districts, and embrace within the United States law the necessary details of locating and recording claims. The leading features of

the details I view as follows: 1st. What shall constitute a legal notice? 2d. How many days will be allowed to mark the boundaries, and in what manner they shall be marked? 3d. The time within which a vein or mineral shall be exposed and a notice of the location filed for record.

2. I would suggest that a possessory title be limited to three years, and that an application for a patent be admitted at any time within three years after an expenditure of \$300 in *developing the mine*.

#### PLACER CLAIMS.

In my opinion placer mines are far more extensive in this Territory than most people suppose them to be. It would be difficult to form anything like an approximative estimate of their extent. They are but little sought for, as the scarcity of water precludes their working with profit. I am not aware of any lode claims or non-mineral land having been acquired under the placer law, and have no amendment to offer except to nullify all local jurisdiction.

#### PUBLIC SURVEYS.

The theory of the system of public surveys under existing laws, as I understand it, is, the extension of all "standard parallels" and "meridian lines" to be made from the "principal meridian" and the "base line," is unexceptionable. The exigencies arising from small appropriations to meet the demand of settlers located at points distant from the lines extended therefrom has rendered it necessary to resort to expedients to accommodate settlers, which mars the symmetry of the lines and involves questions, an instance of which I will hereafter refer to. The extension of the standard lines affords the means of ascertaining the general topography, geological formations, characteristics of the soil and products; without this information an estimate of the proportion of the various classes of land can only be a haphazard guess.

It would also enable the surveyor-general to locate the most important subdivisions and the settlers at remote points to have their lands subdivided by making special deposits, as provided by existing laws. In this connection I may add that the segregation of private lands from the public domain is necessary to prevent the expenditure of public funds in subdividing private land. A glance at the map will show that many thousands of dollars have been expended in that direction.

The manual of instructions needs a thorough revision, which is doubtless well understood by the honorable Commissioner of the General Land Office. I will, however, recommend that the practice of establishing corners on prairie land by pits and mounds be discontinued. The mounds are often obliterated in a very short time and under the most favorable circumstances cannot be distinguished after a few years. A single stone of the minimum dimensions or a mound of stone should be substituted. Posts and mounds in timber land may be traced by bearing trees.

I would respectfully invite attention to the clause in the manual which leaves the responsibility of the legality of the special instructions of a surveyor-general on his deputy. (See case of Deputy William White under contract with Surveyor-General J. A. Prouditt in 1872.)

The surveyor-general should be responsible for his instructions and the deputy should be required to follow them. Also when a deputy closes lines beyond limits in connecting with old or previous work, he is required if necessary to retrace the old lines to discover the error. If the error is found in the old work there is no provision for compensation for this extra work.

The present rates are too low to remunerate a deputy who will do his work thoroughly. Expenses, cash at 18 per cent., risk of stock, delays on account of weather, and other contingencies, are apt to leave on settlement very little compensation.

May, June, September, October, and November are the most favorable months in the year for field operations.

Respectfully, your obedient servant,

WM. McMULLEN.

*Testimony of George H. Pradt, United States deputy surveyor, Laguna, Valencia County, New Mexico.*

The questions to which the following answers are given will be found on sheet facing page 1.

Answers to the accompanying questions of the Public Land Commission, under the proper subheads and numbers.

#### GENERAL.

1. George H. Pradt; Laguna, Valencia County, New Mexico; United States deputy surveyor.

2. I have lived in this county three years; in New Mexico seven years.

3. I have not acquired, nor sought to acquire, title to any of the public lands.

4, 5, and 6. I have not had experience enough on these points to give any useful information.

7. The Territory of New Mexico is an elevated plateau, with extensive plains, destitute of timber and water, but affording good pasturage; probably nine-tenths of the public lands are of this character. The mountain ranges, of which there are three systems, extending across the Territory north and south, are, with their spurs, all heavily timbered, except in the southern portion, and they comprise nearly all the timbered lands. The agricultural lands are confined principally to the valleys of the larger streams, though small isolated tracts occur in the mountains. The soil of the plains, however, is generally very fertile wherever water can be got for irrigating. Very little is known as to the extent of mineral lands, though minerals are known to exist in all parts of the Territory, and coal especially is very widely distributed. There is very little swamp land in the Territory.

8. I think the public lands can best be classified by requiring deputy surveyors under the present system of surveys, to examine (in their township and subdivision surveys) carefully and minutely as to the character of the tracts surveyed, noting the different classes, the kind and position of the country rocks, the climate, natural products, approximate elevation, and to give any other information tending to throw light on the subject, and a description based on these reports could be furnished by the surveyor-general, including all the lands surveyed in his district during each year.

9. The present rectangular system of public-land surveys seems to be the best, on account of the cheapness and rapidity with which the work can be done, and because under it any parcel of public land, however small, can be readily found and identified from its number and designation. The surveys may be carried across mountain ranges by triangulation, and the subdivision surveys in very broken, mountainous regions should be so modified that the lines of survey could be taken through the valleys. Observations for latitude might be made at the initial point of surveys and at stated intervals along the principal meridian, base-line, and other standard lines, and where a telegraph line enters or crosses the district. Longitude stations could be established at one or more points. If increased accuracy in establishing township and section corners is desired, the limit of error allowed under present rules and regulations might be reduced one-half, for the improved instruments now in use will allow of such corners being established with much greater accuracy than is required by the laws. The subdivision of the whole of the public domain into sections under additional regulations and requirements would furnish the basis for a series of minute and accurate maps, at a very moderate cost and in a much shorter time than by any other method. I have been engaged in public-land surveys during thirteen years; also to some extent in railroad, private land-grant, and other surveys.

10. Pasture lands should be offered in larger quantities to actual settlers for stock purposes than under the present laws, and settlers should be allowed to locate irregular tracts of farming land where they occur among the mountains, instead of being required to locate in rectangular lots.

#### AGRICULTURE.

1. The climate of New Mexico is mild, with long summers and short winters, varying somewhat on account of differences in altitude. Rain is confined to the summer, the wet season usually extending from the 1st of July to the 1st of September. Spring opens in February, and is marked by strong, steady winds from the west and north-west and little or no rain or snow. The summer is long and hot, and bright, warm days, with cold nights, continue through the fall and until the middle of December. The winters are mild and the snowfall occurs in January and February, usually in small quantity. Water for irrigating is taken from the streams, swelled in June by melting snow in the mountains and in the summer by the rains.

2. Rain falls in July and August, sometimes in very heavy showers, and furnishes moisture sufficient for all crops for about two months. The rain comes at the time it is most needed, but not early enough for the best results.

3. Very little land in the Territory can be cultivated without irrigation except among the mountains, where the extent of arable land is limited to narrow valleys.

4. Probably one-half of the public lands could be cultivated were water for irrigation available, but the proportion that can be watered from existing streams and springs is small.

5. The crops raised in this vicinity by irrigation are wheat, oats, barley, corn, beans, melons, &c. Fruit-trees and vines are also watered.

6. Probably a ditch 2 feet wide and 4 inches deep, flowing 2 miles an hour, would be enough to water 100 acres of wheat.

7. The source and supply of water for irrigation is in the rivers and springs, and in many places reservoirs could easily be made, to gather the surface drainage during the rainy season in sufficient quantity for the needs of the dry season.

8. The water taken from muddy streams undoubtedly fertilizes the soil, and I do not think judicious irrigation is ever injurious. I have seen good crops of wheat, barley, oats, and potatoes, at an elevation of 8,500 feet, about the 35th parallel of north latitude.

9. Most of the cultivated land in this region is sandy, and there is a loss in the litches and in watering the fields of at least one-half the water used. The whole business of constructing ditches and irrigation and the care and distribution of the water are under the Territorial and local laws and regulations.

10. Water has been taken out along all the streams of any size, under the Territorial and local laws and under the supervision of ditch overseers, who are chosen by the people of the several precincts.

11. Conflicts sometimes arise when parties on the upper part of a stream use more water than they are entitled to or waste what they have taken out, causing a scarcity below.

12. In its present condition, without wells or reservoirs, about nine-tenths of the public land is fit only for pasturage.

13. I know of no reason why *pastoral* homesteads should not be allowed, with the privilege of locating, say, one-fourth of a township, or between 5,000 and 6,000 acres.

14. These pasture lands should be put upon the market as fast as surveyed and sold in large quantities for stock purposes.

15, 16, 17, 18. I am not sufficiently acquainted with the stock business to give reliable information on these points.

19. Cattle raisers do not fence their ranges, but cattle could be safely confined by fences at all seasons.

20. The quality of the herd would undoubtedly be improved by being confined to a certain limited range.

21. Stock water is obtained from springs, wells, and reservoirs.

22. I think one sheep will destroy as much grass as one beef.

23. Grass in the country has diminished or disappeared wherever sheep have been herded, and a considerable part of the public lands have been ruined in this way.

24. Neither cattle nor horses will graze after sheep.

25. Owing to the destruction of the grass by sheep, cattle men always try to keep them away, and quarrels often arise.

26. Valencia County contains about 250,000 sheep and perhaps 40,000 cattle. Sheep are herded in flocks of 2,000 to 3,000 and cattle in bands of 200 or 300.

27. The public lands ought to be surveyed as soon as possible and classified, so that depredations on timber lands could be stopped and for the convenience and benefit of all who are looking for locations on the public lands, as farmers, stockmen, miners, &c.

28. The corners of surveyed lands in this vicinity are all perpetuated by stone monuments, and there is usually no trouble in finding any of them, though they are sometimes destroyed by sheep-herders. I have found and identified public-survey corners in this region that were established more than twenty years ago.

#### TIMBER.

1. The timber lands of this county lie in the western part, and cover about one-third of the public lands of this western part. The great bulk of the timber in the mountains is yellow pine, and the foot-hills of the mountains are covered with a very extensive growth of juniper and piñon, generally only useful for fuel.

2. No timber is planted in this section.

3. Public timber lands might be leased for a limited number of years, and the cutting of timber on such leased lands controlled by regulations to prevent any portion from being entirely denuded.

4. It would be unnecessary to classify timber lands in this section, except so far as to distinguish that which is valuable for manufacturing purposes from that which is only fit for fuel.

5. When forests are felled or burned, a growth of aspen or scrubby oak, or both, springs up, and after several years, when they have attained sufficient growth to afford shade and shelter, the pines again start; but they are of slow growth, and some mountain slopes that have once lost their large timber remain permanently bare, and I am satisfied that diminished rainfall and failure of water in the springs result.

6. Forest fires are started by herders, through carelessness or to burn the dry grass, and by wandering Indians, through mischief or to drive the game together. These fires occur every year in all parts of the Territory, and sweep over extensive tracts, causing irreparable damage. A careful oversight and frequent inspection of forests would no doubt prevent the greater part of this destruction.

7. In this Territory the depredations on timber so far have been confined to a few saw-mills of small capacity, and some little cutting of timber for mining purposes;

but the extensive cutting of timber for railroad ties or fuel for locomotives, or for mining or building purposes, causes great waste, and should be regulated by national legislation, and the necessary laws enforced by appropriate penalties for these depletions.

8. In this section timber is cut wherever it is most conveniently found, and felled timber is always considered the property of whoever cuts it.

9. The timber laws would, in my opinion, be most efficiently executed by officers connected with the respective district land offices, and a sufficient number of such officers should be appointed in each land district to keep up a constant oversight of all the timber lands.

#### LODE CLAIMS.

1. I have made preliminary locations of lode claims, but know very little about mining or litigation about mines.

2. There are in some parts of the mining laws apparent ambiguities that are taken advantage of to make litigation affecting titles, and many quarrels and lawsuits result.

3. After a survey of a lode claim has been approved and placed on file, no subsequent survey should be allowed to infringe upon it, except after a contest in proper form has been carried through, an adverse decision rendered, and the first survey canceled.

4. I understand the top or apex of a lode to be the upper edge; that part which is first reached or passed in developing the mine. Often the apex cannot be found throughout the length of the claim, nor the course nor dip of the lode determined except after very extensive and costly explorations.

5. It does not seem that the intended rights of the discoverer are as clearly defined as they might be by the mining laws.

6. I have heard of numerous cases in which litigation and injustice have sprung from the impossibility of determining these points.

7, 8. I have heard of such contests, but not how they resulted.

9. I do not know of any such instance.

10. Such is often the case where the side lines are required by local laws to be straight.

11. Locations may be made of alleged lodes on non-mineral ground, to secure the monopoly of a water supply or of ground suitable for building, causing injury to *bona fide* locators.

12. I have heard of repeated cases like that of A and B, in which A's title was clouded and he put to expense and trouble.

13. So far as I can learn these cases are very frequent.

14. From what I have learned of mining operations I do not think it possible to retain in the mining laws any provision by which locators can follow the dip of their lodes outside of their side lines without constant disputes. Two men will often locate separate veins near each other that, upon being followed down, will run together, making one vein under the surface, and one locator will claim the consolidated vein by priority of location, while the other claims that his vein is the true lead and the first only a feeder or spur.

15. I have assisted in organizing a local mining district near the Pueblo of Laguna, Valencia County, New Mexico. About twenty men participated, not necessarily miners. The officers elected were a president, to call and preside over meetings; a secretary, with the ordinary duties of secretary; a recorder, to keep a record of all locations and transfers of claims and to issue certificates of records, which were proof of title; and a marshal, to enforce the district laws and rules.

16. In locating an original claim, the locator posted a notice at the point of discovery, stating the time of discovery, direction, and distance claimed from discovery stake, and within thirty days marked the boundaries of his claim by stakes at the corners, and had the claim recorded, receiving a certificate of record.

17. The record could not be subsequently altered, and the certificate, embodying a copy of the record, was a check against fraudulent changes in the record books.

18. I have not known of any such cases.

19. It would be advantageous in my opinion to abolish all local mining-district laws and records, and have the initiation of record title placed only with the United States land officers.

20. The adjustment of all questions and contests touching mineral lands should be left to the proper federal officers, and not to the courts.

21. In view of the constant litigation under the present laws, a locator should be allowed to claim only what is included within the planes drawn perpendicularly downward through both *side* and *end* lines of his claim.

22. A locator should be obliged to acquire title within three years. Under the present laws a mine can be held by a possessory title, worked out as far as possible, and abandoned.

## PLACER CLAIMS.

1. There are no placer mines in this section.

2, 3, 4, 5, 6, 7, 8, 9. I have had no experience in placer mines, or in the operation of mining laws governing the location of placer claims.

LAGUNA, VALENCIA COUNTY, NEW MEXICO, October 23, 1879.

*Testimony of George H. Pratt, Santa Fé, N. Mex.*

SANTA FÉ, N. MEX., September 2, 1879.

GEORGE H. PRATT, United States deputy contract surveyor, made the following statement :

I consider the rectangular system a very good one. I do not know of any way it can be improved, except in the way of accuracy. In subdividing townships into sections an error of one chain is allowed in the length of a mile, and an error of  $3\frac{1}{4}$  chains is allowed to three townships. If increased accuracy is wanted I think that allowance might be cut down. I think it is too great an allowance. I know that surveyors come far within these limits in making their surveys.

Question. Cannot most of the deputy surveyors run a solar transit?—Answer. Yes, and most of them do.

Q. Have you any suggestions to make as to triangulation?—A. I think the use of triangulation for the purpose of passing over barren spots or mountains is a very good thing. I was just looking at a case on the map where the cross-line was traced some 120 miles, and about 70 miles of it was not located on the ground, on account of the rough country. It was located by making transverse lines—in some instances 12 miles—with the compass and chain. It was utterly impossible to locate points with the accuracy of triangulation. I think time monuments would be very desirable. They would be very useful for reference, and would make greater certainty in the survey than now exists. It is also desirable to have permanent stakes. Wooden stakes soon decay. They will last for five or ten years if the cattle do not knock them down. Stone monuments would last much longer. I think it would be well to have permanent monuments at every fourth township corner. Owing to the loss of the corner posts resurveys have frequently to be made, at great expense to the settler. If permanent monuments were there the settler could walk north, south, east, and west and find the boundaries of the land. I think that the principal meridian and base and correction lines ought to be established with greater care, and the initial points determined astronomically. I do not think deputy surveyors are paid enough to prevent them hurrying through their work in order to make more money, and the result is a poor class of work and a great deal of inaccuracy. My experience in mining surveying has not been very great, but I think that endless litigation would be avoided by the square mining location. The amount of land allowed in the United States law is sufficient, and I think that all local mining laws should be abolished and the United States law used instead. I think it would simplify matters very much to have everything relating to mines in the hands of the registers and receivers, and I can see no good reason why the government should not hold on to its mineral lands as well as its agricultural land.

Q. Is there much mineral land in this Territory?—A. Yes; there is a great deal of mining land here. I have seen great areas covered with quartz; and there is a great deal of coal here too.

Q. What do you receive for surveying?—A. I have surveyed in Arizona, Kansas, Indian Territory, New Mexico, and California under the United States system, and we receive \$6 for subdivision, \$8 for standard lines, and \$10 for meridian lines. I do not think that is enough, to do it as it ought to be done. We use monuments of stone, with chisel marks cut in them. The chisel marks are required by law. Most surveyors prefer to use stone—though they can use stakes if they wish to—because they are more permanent. I have retraced lines run twenty-five years ago in this Territory, and there was no difficulty in finding the corners where they were marked with stones. The only cost of these monuments is a man and chisel.

Q. Do you use the solar compass?—A. Yes; we use the solar compass. It is generally used in the Territory by the deputy surveyors who take contracts; but no man uses the solar compass all the time. I would not use any other, however, on such surveys as these.

Q. On the score of cheapness, which would be best, the present system or the one of establishing these corners by triangulation?—A. I think there is no doubt that the present system is far cheaper than to establish them by triangulation.

Q. What have you to say of the timber lands?—A. All the timber lands here are

being destroyed, a great deal by persons who come in with saw-mills. I think the timber lands ought to be put under the jurisdiction of the register and receiver and some effort made to protect the timber, for when the miners go in they will sweep the timber from all the mountains in the Territory in a few years, as they are doing in Colorado; and, as the growth is slow, it will take a long time to replace it.

*Testimony of W. G. Ritch, Santa Fé, N. Mex.*

SANTA FÉ, N. MEX., September 3, 1879.

W. G. RITCH, secretary of New Mexico, made the following statement:

I am very much of the opinion that the general land system of the country, as known to the country at large, is not applicable to the land west of the 100th meridian. If the man that is here finds a spring that is capable of maintaining 5,000, 10,000, or 15,000 head of stock, he buys 40 acres of land, and then he has a monopoly of the whole range because he owns the water. I think, as a matter of fact, that the water should belong to the United States—to the land—and not to the individual; but it is impracticable as far as this country is concerned. If he buys the spring he must buy a certain amount of land surrounding. The quantity of land, by some fixed rule, should go with the necessary quantity of water, as far as determined, flowing from that spring. I am inclined to believe that most of the water rights are already taken up. I think it would be well to sell this pasturage land in large tracts to the cattle herders, as they are of little value except as owned in large tracts. They should, of course, have some limit to them. I do not believe in land monopolies. However, taxation and our system of government reaches these things generally very well. I should say this land ought to be sold at a nominal cost. Certainly very much of it is not worth more than 10 cents per acre. In putting it at 10 cents I would have it carefully restricted. I should classify it very carefully, and make a difference in the different kinds of land. If a man bought land with water on it, a certain amount of arid land should go with it. It is very possible that the old land system in this country is better than the new. If the homestead principle applies in the case of agricultural land, I see no reason why it should not apply in the case of pasturage lands. If the rule applies to agriculture it will apply to stock-raising. I think 3,000 acres would be sufficient for a pasturage homestead. There is no doubt about it, this question ought to be settled as quickly as possible. There is no doubt about that at all. As it is now you are simply breaking up the country by protecting a sort of baronial system by reason of these enormous herds of stock holding great sections of country, which, perhaps, they would not hold if they bought the land and fenced it in. I look upon the present system that they have here as simply calculated to continue indefinitely those troubles which we have had in Lincoln County. The troubles in Lincoln County arise out of its being almost a remote section, outside of taxation. Lincoln County is in the southeastern quarter of New Mexico. We all know something about the character of Western Texas. Each man is a law unto himself. He is a standing army, with a small arsenal on his person. He is a private arsenal, and must necessarily be so by reason of the remoteness of the ranches. They are many times 20, 30, and often 50 miles away from any other ranch. Its location is governed by water holes. These people have gathered here from Texas as a rule, and as it is too often the case they are outlaws from other States. They get to fighting among themselves, and they swarm out and come into New Mexico, and the annual outlet for them is to follow the valley of the Pecos River up into Lincoln County. They are there made use of by the owners of large herds to drive the small owners away. The tendency is for the strong to overpower the weak, and that results from the fact that these lands are held loosely and not purchased. They get possession of the water right, and hold all the land around it. That was how the revolution of last year was possible.

I think that the more you can break up the baronial system the better it would be for the country. If we are going to promote civilization in New Mexico it is absolutely necessary that we should break up this system, whether it is by owning the water in fee or by simple squatter rights. You must, of course, regulate it so that no one man can own the whole section. I think the chances are for a great number of cattle with small owners, rather than large owners. I think there are a large number of small ranchmen that would take up herds of cattle. The situation is this: you want to have just as many people in the country as possible. You want a land system that will induce the greatest number of people; that will be land owners, ranchmen, cattle owners, or whatever you may choose to term them. I think I would sell this land at public auction or private entry at a low rate. I am inclined to think that the pasturage homestead entry is a good thing.

There is such a thing as getting water by digging wells and putting up windmills and other pumping apparatus. There is something in the land system that allows a

man by doing a certain amount of work to acquire a certain amount of land. Might it not be possible to apply this principle to these pasturage lands, regulating the amount of land given by the amount of water he secured. It might be necessary to clear up these arid belts where they are 50 miles away from water to make the quantity of land given larger. That might induce aggregation of capital.

I think it would be well for the general government to conduct a system of experiments in regard to artesian wells. I think that might with propriety be made part and parcel of the geological survey. I think it is economy to do anything and everything you can to increase the population.

I am inclined to think that the old civilization here has no very great love for the new. There has been progress in the country, moral and otherwise. There used to be a time when priests would go into a bar-room and get a drink like any other ordinary mortal, but now they don't. You see screens in front of the doors now, and no more gambling in the public places. I think the Pueblos are the most industrious of the native population.

---

*Testimony of Trinidad Romero, Las Vegas, N. Mex.*

LAS VEGAS, N. MEX., September 5, 1879.

Hon. TRINIDAD ROMERO (ex-member Forty-fifth Congress), sheep and cattle owner. made the following statement:

I am well acquainted with the lands in New Mexico. A great portion of it is pasturage land; only along the streams is it fit for agriculture. Much more could be cultivated if there was water. The future industry of the country is to be stock raising and not agriculture, though it may become a fruit-raising country, and that will pay better than wheat and corn. We raise very good fruit now, such as grapes, peaches, apples, apricots, plums, pears, &c., and most all kinds of vegetables, along the streams. There is not much frost to destroy fruits and vegetables; and then we have dew.

There are very often conflicts between sheep and cattle men. The cattle men are of the opinion that sheep destroy the grazing. If these lands were parceled off for sheep and cattle men there would be no difficulty. My stock ranch is near Fort Bascom. I have about 40,000 head of sheep and 5,000 head of cattle. There is no trouble, because they are kept apart; the sheep grazing on the hills and the cattle on the bottoms and in the cañons. I have never had any trouble, and if this method was carried out there would be no difficulties.

If these lands were fenced it would be much better. In that case you could have the sheep and cattle separate. Wherever the sheep men turn their sheep on the cattle ranges there is trouble. The cattle go away and the sheep tramp down the grass. I think that 30 acres of land can sustain 10 cattle the year round. I think if you put 30 acres under fence and put in 10 beef they will be sustained. Taking a range, I do not know but it would take a much larger amount. About 10 sheep is equivalent to one beef. That is, 10 sheep could be grazed where 1 beef could be grazed.

There is plenty of water in my region. I am down on the Canadian River. The water rights are not all yet taken up. We have no trouble for water, there is plenty, and the country is not yet overstocked with sheep and cattle; there is room for plenty more yet.

Question. Have you any suggestions to make as to the disposal of this pasturage land?—Answer. My idea about that is that it is not a good policy for the government to sell the land, for then great monopolists might get hold of the land and do as they please with it. I think it would be well to dispose of it in pasturage homesteads of 3,000 acres to each man, at a low rate, at 10 cents per acre, on condition that he put up a house and cultivate in timber 5 acres of land, and the government could then give him a patent to that land. That would be an inducement for people to settle all over the country. I think the present homestead and pre-emption system is not adapted to this country.

I am 110 miles southeast of Las Vegas, and at about 3,000 feet altitude, which is much lower than Las Vegas. You can obtain water there in some places at 10 feet, in other places 20, 30, and in some places you have to go as deep as 100 feet. I think the policy of giving each man 3,000 acres would build up the country very fast, but I would not advise selling it in large unlimited tracts, because then monopolists would get hold of it. I think it would be a good thing to allow each man to have his pasturage homestead, and then allow each man to take as many additional acres as he has head of stock at the time of entry or purchase. The actual settlers should be protected with their bands of stock.

I think it would be very unjust to do anything that would destroy the homes of the Mexicans along the little streams. Many of these people have lived there years and years, but have no title to the land, and very little money. I think it ought to

be so arranged that the rectangular subdivisions should be made smaller, so that the Mexicans could get their small irrigable strips along the streams.

Irrigation improves the soil year after year. There could be ten times more than what there is now if ditches were dug and the water properly stored and saved. The rainfall has not increased for the last ten years, but, on the contrary, the streams are falling behind. I know this from others, and my father tells me so. There are many dry streams now that at some past time were full of water. The best irrigation districts are along the Rio Grande, Pecos, and Canadian Rivers. I do not think New Mexico will ever be an agricultural country to any great extent. I think it will have to rely on mines and stock raising.

The timber lands have not yet been injured much, but when the miners come in they strip the hills of the timber. There is good timber from the timber line, which is at 1,200 feet, up to 6,000 or 7,000 feet. I think the whole subject of the destruction of timber could be best attended to by turning it all over to the register and receiver of the district land office.

Concerning mineral claims, I think that they ought to be square; that would stop all disputes that have arisen from not having such a law. We are just beginning to develop our mines, and the subject ought to be taken in time. The whole subject of mining titles should be placed in the hands of the register and receiver of the district land office, as in the case of agricultural and other lands, so that the government can keep track of mineral titles from their inception until the patent issues.

Q. How many sheep, horses, and cattle are there in the Territory?—A. I think there are between 5,000,000 and 8,000,000 sheep in New Mexico, averaging from \$1 to \$1.50 each. There are about 500,000 cattle in the Territory, valued at about \$15 per head, and 200,000 or 300,000 head of horses, varying from \$20 to \$25 per head.

The average price of wool is 10 or 15 cents per pound. Some of the wool is washed and some not. Each sheep averages two pounds of wool. I think 30 acres will support ten head of cattle, if fenced; I mean, of course, average land. That is my experience. I live four miles from Las Vegas, and I have there fenced in about 1,000 acres of land, and pasture some stock there—sheep and cattle. Then in the winter time I always have about 200 or 300 sheep, besides about 200 head of horses and cattle, and that keeps them first-rate. That is, I mean to say that 1,000 fenced acres of hill and bottom land will keep 500 head of stock, sheep, horses, and cattle.

I think it would be well to allow 3,000 acres of land as a pasturage homestead, because that would give the people room enough, and, as wells would often have to be dug (sometimes at a depth of 300 feet) they would not dig them for a less amount of land. If it was 1,000 acres some people would not dig wells, on account of the expense, which is often quite heavy. I would make it one of the conditions of a pasturage homestead that the settler should bring water on the land and improve it by trees, and at the end of five years I would give him this land, if there was water enough to supply five hundred head of stock.

Q. Are not people prevented from coming into the county by reason of the cloud on Mexican title?—A. Mexican titles are good but the land has never been properly surveyed. The government ought to provide for surveying these grants and then the people would know exactly what they are about. The way they are now the people are afraid to take them up. They do not know whether it is public land or in the Mexican grant; and I would have these lands honestly surveyed and then require that the persons holding these claims enter them within one year after the survey is made, and if they did not do so, then the land should be forfeited to the government. I think that Congress ought to confirm those claims that have already been proved up and presented to Congress for confirmation. This grant question ought to be settled at once, as well as the difficulties in Lincoln County, which are caused by the inroads of persons from Texas. If there were permanent titles to the land I think it would tend to settle all such difficulties.

I think I would sell the timber land right out at \$1.25 per acre, allowing it to be taken in limited tracts. Saw-mill men could then buy the land from other parties.

The greatest need we have is people, but we want good, enterprising people.

I think there is an imperative necessity for the government doing two things:

1. Dispose of the land at the cheapest price, under proper restrictions and conditions.
2. Confirming at once and settling the titles to these Mexican claims.

---

*Testimony of William White, Santa Fé, N. Mex.*

SANTA FÉ, N. MEX., September 2, 1879.

WILLIAM WHITE, deputy surveyor, made the following statement:

Question. How long have you been a deputy surveyor?—Answer. Off and on since 1872.

Q. You have heard the statements of Mr. Pratt, do you concur in what he says?—

A. Not entirely. I do not see any use for this extremely accurate and expensive survey of the public lands by triangulation. It is simply the purpose of the government to put the land in the hands of the people, and the land is now surveyed with sufficient accuracy for all practical purposes. When the government parts title to its land, as in Illinois and Missouri, it no longer has an interest in them.

Q. Have you any suggestions to make?—A. I saw among other objections to this system of surveys a complaint made that there is not sufficient information with regard to the altitudes and the formation of the earth's surface, contours, &c. I would suggest as regards that that a great deal of information could be given by obliging the deputy surveyors to carry one of these ordinary pocket barometers in the field and note the elevations and depressions of the land as they pass over it. Of course, the altitudes thus obtained will not be extremely accurate, but still they would give a great deal of useful information and be sufficiently accurate for general purposes. I would suggest, too, that he carry a thermometer that could be read, and there you have a check on this whole system of observation throughout the extent of the public surveys. This taken together with the reading of the barometer would cost hardly anything, and be of great use. These instruments could be the property of the government, to be taken by the deputy surveyors and returned to the surveyor-general when done with.

I was spoken to this morning about the question of making an alteration in the price of public land. My opinion is that it is very much to the interest of the government to go very slowly in that matter. This thing of determining what is arid, worthless land seems to be very simple, but it is not, because it is altogether governed by circumstances which you cannot foresee. Valueless land to-day is settled, cultivated land to-morrow. Land that is thinly populated men will not look at, but when densely populated it is cultivated and valuable. I think that this call for this great reduction in the price of land, and to sell large tracts of it which are now regarded as valueless, comes from swindlers who want to buy it very cheap and sell it very dear. It comes also from men who own large herds of cattle and sheep, and, of course, who like to get hold of it for little or nothing, so that they can subsist their animals upon it. So far as delay is concerned, it does not hurt these men who own the cattle; they are now grazing free of cost. I think that ought to satisfy them. It would be better to lease this land to them for a term of years. I do not see the necessity of sacrificing large tracts of land, selling it now and getting very little for it, whereas in the course of years this land will be very valuable. They are constantly finding out that water can be obtained in one place and another. Right in this town there is land which was supposed to be valueless, and it is now found that it can be cultivated with water. I do not think that all the water in our country is yet known. There are also very large tracts now claimed as worthless that in course of time will be valuable by means of water.

Q. Don't you think there should be some classification method adopted for defining the kind and character of the land which the deputy surveyor returns on the map and field-notes?—A. More information, I suppose, could be obtained in regard to this point by greater accuracy of surveys.

Q. Suppose you had a geologist, would that help you any?—A. Yes, I think it would materially. If the pay for subdividing was better you would then have a better class of work.

Q. Do you not think it would be better to have one general United States law that would regulate all mining matters?—A. Yes, I think it would.

Q. Don't you think that the register and receiver, or by deputy, should have the first inception of mineral titles, and that it all should be in the land office and not in the office of the local recorder?—A. I think that would be very much better, for the reasons that the other gentleman stated.

Before closing I should like to say again that I do not believe it to the best interest of the government to sell these lands in large tracts, and that it should be done with great care if it is done at all.

---

*Testimony of Chas. M. Rolker, mining engineer, New York.*

The questions to which the following answers are given will be found on sheet facing page 1.

NEW YORK, November 6, 1879.

Public Land Commission, Washington, D. C.:

SIR: The editor of the Engineering and Mining Journal has given me a copy of your printed questions, with a request to answer such as I am personally familiar with, and I will answer *seriatim* the questions on "lode claims" as far as I can speak from personal experience.

1. I am an educated mining engineer, studied in Europe (Clausthal School of Mines) and in this country (New York School of Mines). I have followed this, my specific business, since 1868. I have seen and examined the principal German metal mines, and examined the following districts in this country: the New Jersey iron and zinc mines; Pennsylvania—Wilkesbarre, and Scranton coal regions; the Wisconsin lead mines; Lake Superior iron mines and copper mines; the Mariposa County, California, gold mines; the mines of Story, Lyons, and Ormsby, Washoe, Echo, and Elko, and the Eastern Nevada mines. The Nevada mines have come under my observation for an uninterrupted period of over two years. Aside from professional examination in these districts for individuals and stockholders, as commissioner I have been in charge of the Mariposa estate, and directed prospecting operations in Washoe County, Nevada, and am at present on the point of starting for Silver Reef, Utah, to direct the workings of a New York company, the Stormont Company's mines and mills.

2. Overlapping should not be allowed in locating claims, as it will always give rise to lawsuits and blackmail claims as soon as either claim is coming to the front as a paying proposition. I have had difficulty myself in Peavine district, Nevada, which, however, resulted in no lawsuit nor fighting, simply because with the larger number of men at my command I simply removed the monuments as soon as erected; and lawsuits would not be brought because men no doubt had not sufficient confidence in their claims to risk their money in suits, and also because they knew, well backed as I was with money, that litigation would be costly. Among individual prospectors of the same financial caliber frequent troubles arise by one party starting a shaft, &c., in the overlapping ground. Rigid laws should be passed to prevent future swinging of claims by forcing the district recorder to survey each claim in person (so he can not dispute the locating party), to fix the monuments, to keep in ONE book of survey records the bearings of these claims' end and side lines, and that afterwards it be entered in the district plat, say within thirty days of day of location. Have such in express terms of United States laws expressed, and let a claim not placed on record in such or similar manner be forfeited. The locator shall locate in the presence of the recorder, and at that time the district recorder shall survey it, the claim, in person, or by his lawful deputy recorder appointed at the annual meeting in advance, but no other person shall be qualified. The deputy recorder shall place the monuments, 6 in all. 4 corner and 2 center monuments, and it shall be unlawful to overlap ground once located. On the posts have the name of the claim and locator and day when located. Such having been complied with and the recorder stamping with his seal (rubber stamp) the corner posts, a certain fine should be fixed for any one meddling with, changing these posts, or its equivalent in imprisonment. Now it shall be the duty (under penalty of \$——) of the recorder to enter such claim and its notice of location just as of old on the record book within twenty days of day of location, and on the district mine plat within thirty days after location notice. The stamp on the posts is sufficient warning to others and the fine imposed on the recorder to comply with the law. It shall be against the law and subject to fine of \$—— (bondsmen always can pay up) to keep more than one book of locations or survey records at one time, and no new book shall be used until the first is full. This abuse prevails in the West; say three books of record are run at the same time. A locates on the 3d at 11 a. m.; B on the 5th at 1 a. m.; C, a friend of the recorder, locates in reality, as it now goes, on the 20th the same claim, or drives old-looking posts somewhere near the tree monuments; he claims the wind blew his notices down, and tells A he jumped his claim unlawfully. They go to the recorder, he turns to the other book in which neither A nor B are recorded, but kept for such occasions, and turns to a page, and A finds, although in reality he located prior to C, still that the records show, say, he located on the second at night. The records condemn him, and C has still time to the 23d to do his two day's work, as many local regulations require that to be done within twenty days after location. As such A, the rightful locator, is defrauded. Sometimes pages are kept blank for similar purposes. Such acts of the recorder, for which he generally gets \$20, sometimes a drink, should be punishable by a fine of at least \$500, and imprisonment besides. Hard as it may seem, I know of such practices. Were such a law in force the late bloodshed in Borie, about the Jupiter and Owyhee claims, would have been avoided, as one generally known scandal, and many a quiet row would be avoided. Not too much care can be exercised in the first locating and getting the records clear, for it is the foundation to the future successful structure dependent on the good mine.

4. The top or apex of a lode is the outcrop (a), or, in case of a blind ledge, that line of the vein or lode which approaches the surface the nearest. In some cases, it is impossible to determine dip of lode in early workings, and often, if many ravines and hills traverse the country also, its course can only be inferred from the supposed action they had on the course of the vein. For the dip I simply quote you the Comstock lode, which in force

dipped west (one of its branches), and it was also ore-bearing in the western dip, and only when reaching the eastern dip, at about 300 feet depth, parties found out that what appeared as an immense fissure proved to be in reality a spur. In the

Union Consolidated, in Southern California, this change of dip only occurs at 700 feet (nearly) depth. Until they struck this dip, changing into the opposite direction, no one dreamed the lode ever would turn.

Then you have lodes, not side or companion veins or spurs, which on gaining depth come outside of the reach of surface showings, if I may say and assume the general country dip. Now, this may take place at such depth that early workings cannot determine the true dip. Often, yes, very

often, in regular and less disturbed country, it can be determined, but not always. Or take a ledge dipping as I found one in Peavine district, dipping above  $82^{\circ}$ , then  $60^{\circ}$ , then  $45^{\circ}$ ; and its final dip was  $22^{\circ}$ , after attaining 265 feet vertical depth. In the same district I found the change from eastern to western dip due to the action of country rock. Such is liable to occur frequently in zones of contact.

5. Yes, they are.

6. I have heard of such difficulties; but if, instead of arguing whether or not a ledge belongs to a certain outcrop, the court would order a disinterested mining man to raise up a small hole or shaft, or winze, properly speaking, on the lode until it cuts the surface or comes out in the apex, such matters would be easier settled, and such should be done at the expense of both parties, and would cost less than expensive

suits and expert testimony, &c., maps, models. Then the judge and jury could see for themselves. Seldom such troubles arise after great depth has been attained. Say two croppings exist on a hill; my tunnel opens a ledge. I located apex

1. Tom located apex 2.

I should simply raise up to apex 1 to prove my ledge to the satisfaction of any one, and prove his assumed dotted course (a) wrong and (b) probable.

7 and 8. I know of a ledge at Rye Patch Mining Camp, in Nevada, where one lode has two outcrops or apices. *a* the Depha ledge, the older location; *r* the Rye Patch ledge, the newer location. *r* cuts off *a* without a doubt (I examined the case only beginning of last September), and the suit has just temporarily been settled in the Winnemucca courts. The point contested was not what you ask in 8, but was a question of a forfeiting mine on account of legal work not performed.

9. In some instances.

10. Decidedly yes; and Nevada and California mines will certainly suffer by the vertical boundary theory. As far as I am able to judge it is a special Colorado notion to cover its specific cases, which they can do by local laws; but the average of mines in this country would suffer under such legislation.

11. Works both ways; its final result is to open up mineral lands and resources.

12. *B* can try it, but having no case it depends on the judge to allow such blackmail. Should, with a flat dip of the lode the opposite of the sketch, *B*'s shaft strike lode outside of *A*'s side lines at a point not yet reached by *A*, *A* could, with intelligent judge, take injunction on *B* to await proof; but certainly the opposite no intelligent and impartial judge could encourage. *B* certainly can start a suit, as anybody can sue for what does not belong to him, and if he has a sufficient number of men to sweat by twenty-dollar pieces he may even cause inconvenience to *A*; but very few laws, if any imaginable, could prevent such an attempt. I don't know of a case where, save a little sparring, it did, under your stated circumstance, cause considerable inconvenience.

*L. Lino*

13. First part, yes; but would be remedied by my answer to second part, no; but questions of absolute title.

14. Yes, it is.

15. No; but my answer to 2 tells you something of the books of record.

16. They generally modify immaterially the forms required under May 10, 1872, except the affidavit of 2, to testify to the fulfillment of Congressional and local laws, which is hardly ever done.

17. If claim has been located wrong, say, on course, and it is not open to relocation according to law, the original locator simply locates his own claim anew and files and records new notices, recalling the former.

18. Yes. My remedy suggested is that, say, recorder must give, say, two bondsmen of \$1,000 each, which bonds are filed with the county recorder of deeds, imposing fines on suggestions made under 2, and enforcing them strictly. This will give us better recorders. The recorder ought to be able to read and write himself, and not use his deputy for it; be able to make rough mine surveys and sketches or plats with a compass.

19. I think it would be well to leave the mining recorder, but force him under penalty to send every ten days copies of notices of location, with survey minutes and plats, to the United States land officers of the district, so as to guard against future frauds and side entries or destruction of records by fire, so prevalent and disastrous in the West, where the high winds prevail.

20. No; I think better leave it to the courts; for in mining districts, at least at present, the judges and bar generally are better acquainted with the practical explanation of mining laws than the far-off land officers; but I think instead of laying mining cases before juries of men prejudiced by ignorance or bribed by parties, as such incapable to judge because it often goes beyond their intellect, that it is better to have three judges to lay the case before. The study and education of a judge qualifies him more than any jury, except it be composed of impartial mining experts, to decide mining difficulties; and in the end it will prove advantageous to all concerned in our mining domain.

21. Outside of remedies suggested I have only to say that, after thus having secured official absolute title by presence, &c., of recorder, and forcing recorder to his duties, that the receipts for the \$100 required to be done by law annually should be recorded and filed, with the proper receipts and vouchers, in the mining recorder's office, who in turn forwards them to the land office; that the not filing of such work done, with the vouchers, sworn to before a notary, forfeits the claim if such is not done within one year from the date of location, or the after years, commencing and ending on the date on which claim was located.

22. Yes; I think it will. Two years after day of location I think is sufficient time to prove a claim; and if parties do not do more than \$200 worth of work on it, as it is only too often done, such claim ought to be forfeited to the public domain. Provided patent has not been applied for within two years after location, even should several thousand dollars have been expended, I think it should be forfeited; for, as one, the government should profit by our individual possession of the claims, outside of taxes &c.; secondly, two years is sufficient, if diligently employed, to prove a mine; and when proved the United States should have the benefit of it.

Should I not have been explicit enough in my answers, I shall always deem it a pleasure and honor to add to above.

I remain, sir, your obedient servant,

CHAS. M. ROLKER.

P. S.—I am neither interested in mines nor locations, personally or indirectly.

#### *Testimony of Henry Warren, farmer, McMinnville, Yam Hill County, Oregon.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. Henry Warren, farmer; McMinnville, Oreg.
2. In Oregon thirty-two years.
3. Under the donation land laws.
4. Receiver land office Oregon City, Oreg., for nine years.
5. Contested cases six months; uncontested cases the usual time, under each of the different laws.
6. Yes; parties should not be put to the unnecessary expense of advertising thirty days before they can make their entry; neither ought they to be forced to go to the land offices with their witnesses. The new law requiring this is an imposition upon

a class of people who are not able to pay it. It costs now about \$30, when under the old law it only cost one-fourth of that sum.

7. Public lands now here is mostly timber and pastoral lands.

8. By a general rule.

10. The present laws are sufficient unless small fractions disconnected from other lands, which should be disposed of at private entry.

#### AGRICULTURE.

1. Need no irrigation in Oregon; snowfall in valleys; but little in Middle Oregon.

2. From November to February.

3. All portions that can be plowed.

5. All crops.

8. I have no knowledge of it.

12. Many thousand acres.

13. Yes; 160 acres.

14. One hundred and sixty acres.

15. Four acres.

16. Fifty head.

18. Diminished.

19. Yes.

21. Plenty.

22. Ten.

23. Diminished.

24. No; sheep will starve the cattle.

25. None as yet.

26. Don't remember.

#### TIMBER.

1. Large amount in the mountains.

2. Fir, spruce, hemlock, oak, ash, alder, &c.

4. I would classify the land as to price.

5. No, not in the fir-bearing land.

6. Generally from carelessness; heavy penalty should be paid for it.

7. Not much in this section of the country; timber not easily gotten at.

9. No.

#### *Testimony of Orson A. Stearns, Plevna Precinct, Lake County, Oregon.*

The questions to which the following answers are given will be found on sheet facing page 1.

LINKVILLE, OREG., November 28, 1879.

To the Public Land Commission, Washington, D. C.:

In answer to the interrogatories propounded in your circular addressed to myself, I beg to submit the following:

1. My name is Orson A. Stearns; I reside in Plevna Precinct, Lake County, Oregon; am a farmer by occupation.

2. Have resided in this county since the earliest settlement; was the second person to take up a place in this county, and while yet it was a portion of Jackson County. Have resided in this State since 1853.

3. I have sought to acquire title to a piece of government land adjoining some I purchased of the State of Oregon under the soldiers' homestead law.

4. I have been connected as witness and principal in an innumerable number of contests between settlers and swamp-land speculators.

5. The time of securing title to public lands varies, and in uncontested cases is unimpeded and easy to obtain. In contested cases, where the conflict arises between the settler and swamp or other land monopolies, it is frequently prolonged until the settler is frozen or starved out. Within my own knowledge, several contested cases which were tried over three years ago are undecided as yet, and several others have been tried over and over again under some ruling of the Commissioner of the General Land Office.

6. There have been serious defects in the operations of the land laws, resulting sometimes from the different constructions placed upon them by different officers, sometimes by the local land officers being interested in land speculations, or being appointed to their positions through the influence of wealthy land speculators to enable them more easily to defeat the claims of settlers. The present manner of taking depositions

n land cases, when the interrogatories, cross and rebutting, have to be filed, is not calculated to develop the facts in the case, but rather promotes falsifying and perjury. I believe all evidence allowed in contested cases should be produced at the time of trial, and all witnesses should testify in the presence of the local officers and the adverse party, subject to the rules of evidence, and all *ex-parte* testimony be inadmissible. It would prevent false testimony being used as extensively, as a majority of the hired witnesses would not testify where they were cross-examined and confronted with the adverse party.

7. The lands in this county are largely pastoral, though along the water-courses and next the foot-hills some considerable tracts of good farming lands are found. The high altitude of this country and its liability to frost at any time during the summer renders farming, except hay raising, rather precarious, save in a few favored localities. The timber is confined to the spurs of the Cascade and Sierra Nevada Mountains principally, though the high hills which separate the innumerable valleys and basins of this county are partially covered with juniper, and in places with pine and fir timber. The water-courses here are generally destitute of timber. Immediately along the larger water-courses and upon the borders of the many lakes and marshes are valuable hay lands, without which the pastoral pursuits would be very precarious. A great portion of the level lands not marshy are covered with a growth of sage brush and other brush peculiar to the light, friable soil found here, with intervening patches of low alkali patches or basins, where there is little vegetation found except a short salt grass.

8 and 9. In my judgment the deputy United States land surveyors should give the nature of the soil and its adaptability to the different pursuits, especially in a country like this, where such a wide difference exists in lands so contiguous to each other. In a pastoral country, where farming is neither profitable nor successful, native meadow lands should be classed as such, and not returned as swamp or overflowed where they can be profitably used in the pursuits of husbandry in their native or wild condition. Pastoral lands, or such as are unfit for agriculture, embracing a large area of this county, are of two classes—the hilly bunch-grass region and the sage or so-called desert tracts—where there grows a variety of grasses among the brush that afford sustenance to vast numbers of horses, cattle, and sheep. The timber lands should also be classified and priced according to their relative values. First, heavy timber or forests, where the timber is almost the only product of the soil and is suitable for lumbering purposes; second, the more thinly-timbered kinds, where the timber is less valuable for lumbering purposes; and third, that class that is sparsely timbered, or only sufficiently so as to afford fire-wood and for some of the necessary improvements usual to newly-settled countries.

10. In my opinion, every settler upon the public domain should be allowed to purchase, at as low a valuation as it may be placed at, from 40 to 120 acres of timber land as near as may be to his farm, when such farm is prairie land, or so nearly so that there is insufficient for fire-wood or the improving of the land.

#### AGRICULTURE.

1. In this county the rainfall is light, the summers being nearly always dry. The snow falling frequently before sufficient rain has fallen to start the grass, generally melting off in February or March on the open country, but remaining in the mountains until May or June. Summer rains are generally followed by frosts, except in sheltered or highly-favored localities. The water supply, except in places, is limited and from the nature of the valleys, being low and level excepting in the foot-hills there is not much chance for irrigation during the time such a measure would be beneficial, owing to the fact that in most places the streams or channels from the mountains become dry early in the season.

2. The rainfall generally occurs either in November or in February and April. I do not know its relative quantity, as it varies with the seasons, sometimes being greater in the fall, sometimes in the early spring.

3. By fall plowing, where practicable, or summer fallowing, the larger portion of the arable land can be successfully cultivated without irrigation.

4. Where practicable to irrigate, it would be beneficial to the larger portion of the lands, especially where too sandy or too strongly alkaline, as the water would tend to wash away and destroy the alkaline deposits that accumulate on the top of the land as it dries and burns up or destroys the tender vegetation.

5. Very few crops are raised by irrigation; except in a few localities it is not practiced, and then only in gardening.

6 and 7. The water supplies here are generally the lakes, or deep, sluggish streams that are raised sufficiently by the melting snows to dampen the low lands around them excepting in dry seasons. Very few of the feeders to these lakes and rivers but are too remote from the agricultural portions to render them available, as the country is

so broken up into separate valleys and basins that canals to carry these waters would be too costly and expensive to be constructed.

8. In this part of the country there have been no opportunities for practical observation of the effects of irrigation. Crops are raised here at various altitudes, from 4,200 to 4,500 feet.

9. Is not pertinent to this country, for reasons above stated.

10 and 11. Comparatively none.

12. At least nine-tenths of it; or more, including timber range.

13. It is; and the quantity should be not to exceed one section of strictly pasture land.

14. It is not, excepting where the country has been settled for a number of years and the agricultural lands nearly or quite all exhausted, when I would allow each settler to enter contiguous pasture lands, which, together with his other lands, should not exceed one section.

15. From 10 to 12 acres. In newer sections, where the range has not been overstocked, it takes less.

16. From 100 to 125 head.

17. Cattle and horses both; there are perhaps about 30 to the square mile.

18. It has diminished, except in places remote from water, where it is only grazed during the late fall months.

19. Where they can secure a large range by a little fencing they do, but they generally run on the common, and are only separated during the winter, when they drive up those they wish to feed. They could be when water is plentiful for their use and feed provided against severe storms; otherwise, not.

20. Undoubtedly they would, as with the present system the enterprising man is taxed to improve his less enterprising neighbor's cattle, and bulls are not confined, but roam at will through the country.

21. Springs, rivers, and lakes or ponds.

22. Six sheep are generally equivalent to one cow.

23. I think it is injured less by sheep than cattle, unless they are kept too continuously upon one place year after year.

24. They will not to any extent.

25. Cattle men have strong prejudices against sheep, as the latter will drive the former away from any range where they are kept.

26. There are more cattle than sheep; the former are not herded; the latter are kept in herds of from 700 to 3,000 each.

27. I believe none, as my opinions are set forth very fully in preceding answers.

28. There is, on account of the insufficiency of the mounds and the poor quality as well as insufficient size of the posts set to mark the corners.

#### TIMBER.

1. The exact or approximate amount of timber in this county I could not state. On the west side of the county, which embraces the eastern slope of the Cascade Mountains, there is a heavily timbered section, consisting of yellow and sugar pine, yellow cedar, red and white or balsam fir, with a few smaller and worthless varieties. The crests of the higher mountains dividing the numerous valleys and basins of the county are covered with a similar growth of pine and fir, while on the lower hills, and scattered in small clumps or clusters, there is a considerable amount of juniper timber. There is, perhaps, one-third of the area of the county covered with a growth of timber.

2. There is no timber culture in the county within my knowledge, only a very few small orchards of fruit-trees set out.

3. I would dispose of the public timber by sale only, and classify the timber lands as first, second, and third quality—the heavily timbered constituting the first or most valuable class, which I would sell in 40-acre lots only, and at a minimum price of \$4 per acre. The second class, where the growth was less heavy and valuable, I would limit to 80 acres and place the price at \$2.50 per acre; while the third class, which would embrace lands that were very sparsely timbered or covered with timber suitable only for fire-wood and the many requirements of a farmer's or rancher's uses, I would limit to 160 acres and fix the price at \$1.25 per acre. This would enable those owning lands that were not supplied with timber to purchase and control enough for their own use and insure an economic use of the same.

4. Included in above answer.

5. In the heavy pine and fir forests there is a second growth, but it takes at least two or three generations to enable it to reach sufficient size to be valuable. In the juniper forests there is no new growth.

6. Forest fires here are generally the result of carelessness or wantonness on the part of hunters. Generally they are built by Indians to concentrate game. The method of prevention in the former case would be to make it an offense punishable with a heavy fine or imprisonment, and give half the amount recovered, or a sufficient

remuneration, to insure the conviction of the guilty parties. In the latter case punish the Indians by taking from them their annuities or forbidding them the privilege of hunting outside their several reservations.

8. The local customs as to cutting public timber are that the ownership rests with the party cutting it, except where such party is hired by the day, which is a rare occurrence. Rails, shingles, shakes, cord-wood, fence-posts, and saw logs are generally purchased of the party who fells the timber at customary prices, and are often contracted for in advance. In this section the dead and fallen timber is generally used for fire-wood, except near the towns, where it is customary to fell green timber and cut and cord it and let it season. Fence-posts are generally made of dry timber, either fallen or standing, as it is generally conceded that such timber lasts longer when set in the ground.

9. I think it would, if instructions and regulations were adopted to render their administration efficient and impartial. But such offenses are usually condoned or overlooked in large or wealthy corporations, and only noticed where the offender has been informed on by some jealous or vindictive neighbor.

Very respectfully,

O. A. STEARNS.

---

*Testimony of Charles M. Foster, surveyor and civil engineer, Baker City, Baker County, Oregon.*

The questions to which the following answers are given will be found on sheet facing page 1.

Answers to questions submitted by the Public Land Commission.

1. My name is Charles M. Foster; residence, Baker City, in Baker County, Oregon: occupation, a surveyor and civil engineer.

2. Have lived in the county seventeen years.

3. Have not.

4. During the past nine years much of my time has been spent in assisting parties in obtaining title to public lands, under the pre-emption, homestead, mining, desert, and timber laws of the United States.

5. Under the pre-emption law it requires from forty-five months to five years to obtain title, and costs the claimant from \$21 to \$50 exclusive of acreage. In contested cases the time and expense are increased indefinitely. Under the homestead law it requires from six to eight years and costs from \$43 to \$90 to obtain title. Under the mining laws it has required not less than two years, and in some instances seven, to procure title. Under the timber and desert acts no titles have been obtained in this county, although the provisions of law have been executed and complied with. The expense of obtaining title to mineral lands in each case range from \$125 to \$500, exclusive of acreage.

6. The following provisions of the pre-emption and homestead laws, in my opinion, ought to be changed, to-wit: "An act to provide additional regulations for homestead and pre-emption entries of public lands," approved March 3, 1879. The above act requires the claimant of pre-emption and homestead lands to give notice of intention to make final proof by publication in a newspaper for thirty days. It is difficult to conceive the object of the above act. As the homestead and pre-emption laws provide how and in what manner contested cases shall be determined, and further provides that none but actual settlers can receive the benefit of those laws, hence it follows that none but an actual resident upon the land can have and maintain a valid adverse claim; consequently it follows that the notice required above is given for the benefit of no one but the applicant's neighbor, who must be a resident of the same tract of land in order to be interested in the final proof; hence the published notice is a useless expense, as all adverse claimants must be, or must have been, upon the land and, of necessity, be in full possession of all the facts relative to the rights of the original claimant.

Under the present homestead law, an applicant, if not residing upon the land, or some member of his family, must appear at the land office and make his affidavit. If he, or some member of his family, is residing upon the land, he can make his affidavit before the clerk of the county. Query: Why discriminate, and force the applicant to travel 150 miles to visit the land office, which is the case in this district? Again, under the present pre-emption and homestead laws the applicant, in making final proof, must present himself in person at the land office and make his final affidavit, while the affidavits of his witnesses are permitted to be taken before a clerk of a court of record or county judge. Why compel the claimant to travel long distances to reach the land office, and allow his witnesses to be qualified before a county clerk or judge?

7. The physical character of the public lands in this land district are arable, irrigable, timber, pasturage, swamp, and mineral, and can only be classified by geographical divisions.

## AGRICULTURE.

1. Climate, mild. Rainfall, light. Snowfall varies from none to two feet in the valleys. Water-supply for irrigation is limited.

2. The rainfall occurs late in the fall and early in the spring. From May until October no rain can be expected; consequently, during the irrigating season no rain can be expected.

3. No portion.

4. About one-tenth.

5. All crops are raised by irrigation.

6. About 3,000,000 cubic feet of water. Some land requires more, some less, owing to its character.

7. The sources of water-supply are the mountain streams that are fed by the snowfall; in summer they shrink to one-third or one-tenth of their spring quantity.

8. I have no experience on the subject of irrigation, only in this county. The fertility of the soil is unquestionably injured by irrigation, not only in proportion to the increase of crop produced by it, but also by reason of the washing away of a portion of the soil yearly.

9. It is impossible to calculate the portion of water wasted in irrigation, and the portion returned to the stream. Some soils absorb treble the quantity of water of others. The return of surplus water to the stream, after irrigating, is voluntary. The doctrine prevailing here is that the first appropriator of the waters of a stream has the entire and exclusive control of the water he appropriates, consequently subsequent location of farms upon a stream affording but a limited supply of water are made at great peril. Much trouble and litigation has arisen from the practice of one man controlling the water of a stream. There should be a law enacted requiring each farmer located upon a stream of water to use the water judiciously and return all the surplus water to the natural channel, so it could flow on to the next farm below.

10. The waters of all streams available for irrigation are claimed, under the common rule of miners, by posting a notice at the point on the stream where the water is to be diverted, and by cutting a ditch to convey the water.

11. Conflicts relating to water rights arise from two parties claiming water from the same stream. The quantity appropriated and the priority of appropriation are the principal questions to be decided.

12. About nine-tenths.

13. It is not practicable.

14. Thousands of acres of the pasturage lands in this land district are already in market, and have been for years, but no one will buy.

15. Cannot say what quantity of land is requisite to pasture one head of beef, as the pasturage lands dry out and the grass becomes too dry for the cattle to eat in the dry season, and they resort to the bottoms and low lands.

16. One hundred and fifty head of stock cattle.

17. About five head, taking the whole county.

18. It has diminished. Bunch-grass will not bear feeding.

19. They do not. Cattle cannot be confined in winter unless fed.

20. No.

21. Mountain streams.

22. Seven sheep are equal to one cow.

23. Has diminished.

24. They will not.

25. In this county there are 50,000 cattle and 30,000 sheep, in herds of 5 to 5,000.

26. There is not, as the surveys are of recent date comparatively.

## TIMBER.

1. There are about 100 square miles of timber lands in Baker County. Its character is pine, fir, and tamarack.

2. No timber planted.

3. My opinion is that timber lands should be disposed of the same as placer mining ground is at present—that is, by legal subdivisions where the surveys have been extended, and unsurveyed lands to be surveyed in tracts not exceeding 160 acres, in any form the applicant might desire. The reason for such disposition is this: In all of the mining districts in this State the timber lands are located upon the mountains, and are never sectionized by the government, for the reason that sufficient land cannot be sold to justify the expense. Hence the necessity of some law whereby persons who desire to manufacture lumber in these mining camps and districts can purchase timber wherever they may wish. The present timber act applicable to Oregon is simply an outrage upon the people in every section of the State where the timber lands are not sectionized. In this part of Oregon it virtually compels every man to cut his own wood and manufacture his own lumber. It is difficult to conceive of a

greater absurdity than the present law. I think 160 acres are sufficient for one person, and \$2 per acre a sufficient price. Trees in our forests suitable for making lumber are scarce, hence the necessity of allowing a party to buy as much as 160 acres. A stumpage law would work well here.

4. I would not classify timber lands.

5. There is a second growth of timber; same character as the original. Its growth is slow.

6. Indians are the prime cause of our forest fires. Each year the fires consume more wood than the entire population of the country. The prevention of these fires is simple—kill every Indian that leaves his reservation.

7. No unnecessary depredations are committed.

8. Have no local customs.

9. If the present timber laws were enforced it would necessitate the abandonment of this entire county. The timber laws would undoubtedly be more efficiently executed if placed within the jurisdiction of the district land officers.

#### LODE CLAIMS.

1. Have mined more or less in California, Oregon, and Idaho Territory during the past twenty years. Have acted in the capacity of deputy United States mineral surveyor since 1871.

2. There are many defects in the mining acts. First, there is altogether too much red tape, too much expense, and too much time required to obtain title. (See my answer to question 21.)

3. The official practice of filing surveys of lode claims which overlap on the surface is wrong, and wholly unwarranted by the mining law. Section 2322 of Revised Statute gives the locator on a lode all the surface ground and all the mineral-bearing veins within his lines of location. Hence what right has a subsequent locator to overlap another claim?

4. The top or apex of a vein or lode is that portion of the vein that is visible in the country rock when the loose dirt or earth has been removed. Some veins stand up above the country rock like a wall. The top of such veins would be the highest part of such wall above the ground or bed-rock. The top of a vein can be determined by uncovering it at any point; the true strike of a vein can only be determined by uncovering the entire vein or by uncovering it at various points so as to prove its continuity; the dip must be determined by sinking a shaft or incline on the lode. It very seldom happens that all these features can be determined in the early working of a vein.

5. The rights of a discoverer are properly protected under the present law, the burden under which he labors being the determination of the true strike of the vein. This he must ascertain or take the chances of not including the vein within his lateral boundaries. The dip of a vein cuts no figure in the original location of a claim.

6. Litigation has not, to my knowledge, grown out of the impossibility of determining the true course of a vein, but has ensued from carelessness in making a location before the strike of a vein was determined. The famous Emma mine in Utah was located crosswise of the vein instead of lengthwise through a misapprehension of its true course.

7. Have not.

9. I have never known the outcrop of a vein to exceed the legal width of a claim. The float may be distributed over a space wider than a lawful claim.

10. They do, unless the true course of the vein is determined before the claim is located; hence the fault of the present law requiring the end lines to be parallel.

11. Locations on alleged veins are not permissible under the present law. No location can be made until a mineral-bearing vein has been discovered.

12. B cannot under the present law. The original locator can follow the dip of his vein wherever it goes.

13. I have known litigation to arise from a subsequent locator striking the original vein outside of the lateral lines of the original claim, but the only trouble in such cases can be removed by connecting and tracing the vein in the first location to the works on the subsequent claim. Whenever it is shown that the subsequent locator is working the same vein as the original locator, then there can be no chance for dispute under the present law.

14. It is difficult to conceive what provision could be inserted in the mining law affording any further protection to miners in following the dip in their veins or that would prevent litigation.

15. At Auburn, in Baker County, Oregon, I was present and assisted in organizing a local mining district. There were about thirty miners present; none others took part. The only officer elected was a district recorder. His duties consisted of going upon the claim (when called upon to record it) to measure it and to describe it with sufficient certainty so it could be readily found, and to record and number the claim in a

book kept for that purpose. The record-book of a mining district consists of a book in which the boundaries of the district are described and the rules governing the location, holding, and making of claims, and if the book is of sufficient size, it also contains the record of location of claims. The books commonly used are 4 by 7 pass-books, carried in the pocket. When one is full another is procured, and in course of time some of the books are lost or mislaid; hence the records are in nine cases out of ten defective. At the present time in this section of the State not one mining district in five pretends to keep up an organization.

16. The common mode of taking up and locating a mining claim under local rules is to measure off the claim of the size allowed and set stakes at the corners, and then post a notice on the claim and have the notice recorded by the local recorder of the district. The object of the record is to give notice to outside parties that the particular piece of land has been claimed. So long as the claimant complies with the local rules he can hold the claim.

17. The record cannot be altered, but a new location can be made covering the original claim and embracing others.

18. Litigation has ensued from fraudulent manipulation of records, and there is no security against it.

19. Local mining laws and rules are a nuisance, and should be abolished at once and the initiation of record title be placed with the county clerks of the various mining counties. The land office is too remote from the mines in these Western States. For instance, a party wishes to ascertain whether a particular tract of ground has been located. If the record of such location is in the district land office he must travel hundreds of miles to ascertain. The county clerk's office is the proper place.

20. To transfer the jurisdiction of controversies concerning mineral lands from the State courts to the local land officers would, in my opinion, be wrong for two reasons: 1st, as a rule United States land officers are poor lawyers, even in land matters, and I think that our circuit and district judges can come nearer doing justice to mineral litigants than the local land officers; 2d, it would be very expensive for litigants to attend the United States land office with their witnesses, the distance being so great.

21. I think it desirable to retain the leading features of the present mining laws; its red tape and expensive administration are its most obnoxious features. To illustrate I append a list of papers that are essential in order to place a claim before the General Land Office for patent.

1st. Request of claimant for survey—the request must be in writing, and made to the surveyor-general.

2d. Estimate of office work in surveyor-general's office.

3d. Claimant makes a deposit of such expense.

4th. Three duplicate receipts of such deposit, one of which is sent to United States Treasurer, one to surveyor-general, and the third is retained by the claimant.

5th. Order of surveyor-general to deputy surveyor to survey claim.

6th. Survey of claim and field-notes of same.

7th. Two affidavits of assistants in making survey.

8th. Affidavit of deputy surveyor as to the correctness of survey.

9th. Certificate of deputy surveyor to character of ground and value of improvements.

10th. Affidavit of two disinterested persons as to value of improvements.

11th. Plat of claim and field-notes for surveyor-general.

12th. Affidavit of two persons that no vein or lode exists on the claim. (If the claim is a placer.)

13th. Four plats of claim made by surveyor-general.

14th. Two copies of field-notes, with two certificates on each.

15th. Notice of application for patent posted on claim with field-notes and also plat of claim must be posted on claim.

16th. Affidavit of two disinterested persons that the notice of intention to apply for patent, copy of field-notes, and plat of claim were posted.

17th. Affidavit of claimant of citizenship.

18th. Certificate of no suit pending (by clerk of county).

19th. Sworn application of claimant for patent.

20th. Certified copy of original notice of location and abstract of title.

21st. Agreement of publisher not to hold United States responsible.

22d. Transmission of papers to land office with \$10 register and receiver's fees, with request for order of publication.

23d. Order of publication.

24th. Affidavit of claimant that notice and plat remained posted on claim during sixty days of publication.

25th. Affidavit of claimant to costs in case.

26th. Affidavit of printer that notice was published.

27th. Certificate of register that plat, field-notes, and notice were posted in his office sixty days.

To the above maze of red tape add the exorbitant fees of the surveyor-general, which on this coast range from \$25 to \$40 in each case; the local land office fee of \$10, and the printer's charge of \$15 and \$30 in each case, and is it to be wondered at that as few miners seek to obtain title under the present law. But the above expense is not all; in order for the miner to engineer his claim through to patent he must call to his aid the services of an attorney, which never are less than \$50 and sometimes reach \$500.

We will now eliminate some of the red tape and state what we believe to be necessary steps for a miner to take in order to obtain a patent.

1st. Let the claimant make his application for survey of his claim direct to the deputy surveyor, this will save one month's time in this State.

2d. Let the deputy surveyor make the survey and return a transcript of the field-notes to the surveyor-general. Abolish all fees to the surveyor-general.

3d. After the survey is made let the claimant post upon the claim for sixty days his notice of application for patent, giving a description of the claim by the field-notes. No plat is necessary to be posted.

4th. At the expiration of the sixty days let the claimant make his application for patent to the land office, showing his title, amount of improvements, citizenship, &c., as at present, and pay his acreage. Abolish the publication of notice, it does no good, not one miner in fifty ever sees a copy of the paper containing the notice; with equal propriety you might require the pre-emptor of agricultural lands to publish a notice.

22. There ought to be a limitation to the possessory title to a mining claim, and the claimant should be compelled to acquire title from government within two years from date of his location, and where claims have been held and marked for a series of years the owners should be compelled to obtain title or commence proceedings therefor within one year.

#### PLACER CLAIMS.

1. About one-tenth, and mostly surface diggings.

2. I am. Have spent several years in mining, and have acted in the capacity of United States deputy mineral surveyor.

3. Not less than two years and often five and seven years to obtain United States patent without contest and twenty-four hours to obtain possessory title to a mine without contest, and a lifetime with contest.

4. The experience of others in this vicinity corroborate the above answers.

5. They are defective.

6. There is no time fixed in the present mining law in which the applicant for patent must pay for the land embraced in his claim; consequently parties to my personal knowledge have made application for patent and then rested their case, and worked the claim out and gone elsewhere; hence in many instances the government never realizes a dollar for the ground. (See my answer to question 21 under caption of lode claims.)

7. No titles are obtained for non-mineral lands.

8. It has not.

9. I do not.

#### *Testimony of J. L. Morrow, merchant, town of Heppner, Umatilla County, Oregon.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. J. L. Morrow; town of Heppner; merchant.

2. Fifteen years.

3. Not any.

4. My experience has been limited.

5. Can't call to memory any.

7. We have complete variety. Mountains covered with timber, plains undulating and covered with grass and every variety of soil; both pastoral, agricultural, mineral and timber.

8. My opinion is the pastoral lands of this county ought to be surveyed and sold in lots of 1,000 acres, timber lands sold in lots from 40 to 160 acres.

10. My opinion for this part of the country the land system of disposing of lands is as good as can be. However, I would subject to survey all this country and sell in lots of 1,000 acres and limit each man to that amount.

#### AGRICULTURE.

1. Can only say we have good climate, very seasonable, plenty of water for irrigation.

2. October 1; sufficient amount, and ceases about July 1.

3. My impression is the great mass of the country can be cultivated without irrigation.
5. Vegetables of every variety; fruits, grain, &c.
6. Can't say; just owing to location and soil.
7. Small creeks running all through the country.
8. Don't think irrigation injures the soil.
10. The country is full of small creeks and as it passes through the country it is used as they want it.
12. One-fourth.
13. Yes, and allow 1,000 acres to each settler.
14. Yes. Yes; to 1,000 acres.
15. Ten acres to every head.
17. Don't know.
18. Grass is diminished.
19. Not any. They could be confined in safety in limited quantities.
20. Yes.
21. Plenty of water.
22. About five to every beef.
23. Diminished.
24. No.
25. Not any.
26. One half-million; herded in lots from 1,000 to 3,000.
28. Yes.

## TIMBER.

1. Fully one half of this county is timber lands—pine, fir, tamerack, principally.
2. Not any, except for ornamental purposes.
3. By sale. A portion of our country is mixed—both timber, agricultural, and pastoral. In land of this kind I would sell in lots of 1,000 acres; in dense timber, in lots from 160 to 200 acres.
4. Yes; throw it open to settlers at reduced rates.
6. Move the Indians, and forest fires cease.
7. No unnecessary waste in this part.
8. Just enough for immediate use by settlers, in fencing, &c.
9. Yes.

## LODE CLAIMS.

1. None.

We have both placer and quartz mines, but my experience is very limited.

Very respectfully,

J. L. MORROW.

*Testimony of Robert Mingus, Tuscosa, Oldham County, Texas.*

The questions to which the following answers are given will be found on sheet facing page 1.

TUSCOSA, OLDHAM COUNTY, TEXAS, December 2, 1879.

*Public Land Commission:*

SIRS: In answer to the questions contained in your circular, I beg to submit the following:

1. Robert Mingus; Palo Duro Cañon, Staked Plains, Panhandle, Texas.
2. I have wintered sheep in the Panhandle of Texas during the past three years, but my residence has been for six years chiefly in Colfax County, New Mexico, and to which section my replies will be mostly directed.
3. I have never even sought to acquire title to any public land.
- 4, 5, 6. There seems to be no difficulty in getting as many claims as may be desired. Frequently several miles along a stream are occupied and controlled by one man, the titles to these lands being had, in many cases, by hired perjurers. I might add that it would be impossible to prosecute the stock business, in many sections, if the provisions of the land laws were strictly executed.
7. In addition to the mountainous portion of Colfax County, there is considerable mesa country very suitable for summer grazing; the balance of the county is prairie; it consists of pastoral, mining, timber, and agricultural lands. The same statement will apply to the counties of Mora, San Miguel, and, I believe, to the greater part of New Mexico and Colorado.
8. A thorough survey under competent charge is the only method by which the land can be properly classified.
9. No answer.
10. The existing system is probably as good as could be devised for agricultural

lands; but as nine-tenths of the country is only adapted to pastoral purposes, the present plan does not meet the wants. I would lease and sell land, in addition to existing privileges, in large or small quantities, to actual settlers.

#### AGRICULTURE.

1. Climate moderate; rainfall limited; length of seasons varies very much with altitude; snowfall considerable in the mountains and but little on the prairie; water for irrigation extremely limited.

2. Some little rain or snow is expected in March and April, which starts the grass; very little rain in May or June; in July and August it rains every day around in spots; in September and October, dry; not more than one or two storms in November, seldom lasting over twelve hours; December, January, and February are probably more stormy than November. If the whole rainfall of the past twelve months had been concentrated at the time most needed for agricultural purposes, it would have been decidedly insufficient, and this would be the case eight out of ten seasons.

3. None.

4. Little.

5. Wheat, barley, corn, oats, vegetables, &c.

6. No answer.

7. Some land can be farmed on most of the running streams. On the Canadian, Pecos, Rio Grande, Mora, and Vermejo Rivers there is considerable farming done at the present time. The Rio Grande and Pecos Rivers run through very rich valleys, which are capable of producing most anything that grows. Since the advent of railroads, however, even these rich valleys will not be able to compete with Kansas in the production of grain; but they can spread themselves in most any other direction with profit.

8. Crops of wheat, oats, barley, some corn, potatoes, &c., are grown on the head of Dry Cimarron River, Colfax County, New Mexico, about 7,000 feet altitude.

9. No answer.

10. Very little, if any, water remains to be taken up in Colfax County, and I believe this statement would apply to the neighboring counties, to a considerable portion of New Mexico, and to a still greater extent of Colorado. On surveyed lands, under the homestead and pre-emption acts as well as by custom, which permits a settler to own and control by the erection of cabins from one to ten claims. On unsurveyed lands a cabin, and in many cases four logs, a "foundation" as it is called, control water rights.

11. I believe there is some trouble at times over water rights for irrigation purposes. In some sections there may be a dispute between stockmen over water privileges—especially is this liable to occur between the cattle and sheep interests.

12. In Colfax County, outside of what might be termed mineral land, about 999 acres out of every 1,000 is adapted to pasturage only, and this statement will apply to all of New Mexico, California, and Arizona.

13. Yes; at least 10,000 acres.

14. Yes; the quantity sold to each person ought to be limited.

15. Thirty acres; this I should say was the general average of California, New Mexico, and Texas.

16. Two hundred head of good cattle.

17. In thickly settled portions of Colfax County, from 15 to 20 head of cattle per square mile. In other sections not one-tenth that number.

18. I notice in six years very little change, where the range has not been overstocked.

19. Very little fencing done in New Mexico for any purpose whatever. Stock could be fenced in if there was suitable shelter inside the inclosure. During a storm they require natural or artificial shelter. Texas stock would carry away any barrier in the fence line in a case of emergency.

20. Directly.

21. In Colfax County, the Canadian, Dry Cimarron, Red, Vermejo, and Cimarron Rivers, the Uña de Gata, Chiconia, Crow, Rayado, Chico, Palo Blanco, Don Carlos, and Ute Creeks, the Tenaga, Carrizo, Ponca, Tramperos, Cenigilla la Barro, Rafael, and Currumpaon arroyos, and various other small streams, arroyos, springs, and lakes.

22. Seven head.

23. I can see no change where the range has not been overstocked.

24. An experience of five years in Colfax County, in the heart of the cattle range, requires a positive "Yes."

25. There is a prejudice among all cattle men respecting the sheep interest. Many of these cattle men claim, and no doubt they are honest in their opinion, that sheep will drive cattle entirely off their accustomed range; that the hoof of the sheep poisons the earth—directly the reverse of the old Spanish proverb. There have been frequent serious disturbances in Colorado in times past, especially in Huerfano County. In 1864-

fax County, New Mexico, there have been Mexican sheep-herders murdered within two years, and I recollect of two cattle men being shot by a Mexican sheep-herder several years ago in my neighborhood. There has been no disturbance in Colfax County between the cattle and sheep interests which properly belong there; some ill-feeling probably on the part of some particular individuals, but it has never gone any further, the sheep men, as a rule (outside of the traveling Mexican herds), confining their stock to a specified range, while the cattle interest claim no particular range, except as to sheep, but the whole country in general, and which necessarily includes all the sheep ranges.

26. Don't know the number of cattle and sheep in Colfax County. Cattle are not herded. Sheep are herded in flocks from 1,000 to 3,000 head.

27. The present system of disposing of government land in this country has always seemed to me entirely unsuited to its one valuable quality. Outside of the mineral land, the only land worth taking into consideration is the pastoral land. Very little improvement can be made in the present unsystematic way of conducting the stock business until stockmen own their ranges. In disposing of lands for pastoral purposes, care must be taken to protect the settlers who have already acquired lands under the present laws. I would therefore allow and reserve for each quarter-section claim (160 acres), and adjoining thereto, forty full sections (25,640 acres) for pastoral purposes. These settlers should be required to buy or lease all or any part of these reserved lands within three years, or else forfeit their right to the especial reservation. Whatever land is not reserved for these settlers should be sold or leased in any sized tract, not to exceed, however, 160 full sections (102,560 acres), and only to actual settlers. The water privileges might be in addition to this amount—say to the extent of one full section (640 acres). The price of land on the water should be \$1.25 per acre, which would protect the farming interest, while the grazing land should be at 20 cents per acre. The rent about 6 cents and 1 cent per acre. The timber ought not to be disposed of; it should be reserved for the use of the settlers, under proper restrictions; the grazing privileges, however, could be sold; the owner of this privilege would naturally act as a guardian over the timber. Purchasers and lessees of land should be required to stock it to one-fourth its capacity within a stated time. These are the main features of a plan for disposing of the government land in this western country, and I believe if a system embracing these ideas could be adopted much good would result therefrom. A great deal of land very distant from water, unproductive now, would soon be adapted to stock by the sinking of wells and the making of reservoirs. The government would derive a handsome revenue directly and indirectly; it would place the stock business on a permanent basis; the production would not only be increased, but the quality would be vastly improved; it would settle up the country quickly and permanently; it would end the hostilities between the cattle and sheep interests, and, finally, it would necessarily be a big agent in settling the Indian question.

28. I believe there is no trouble in ascertaining the corners of surveyed lands in Colfax County.

Timber and mining questions unable to answer.

Respectfully submitted,

ROB'T MINGUS.

#### *Testimony of T. C. Bailey, Salt Lake City, Utah.*

SALT LAKE CITY, UTAH, December 8, 1879.

SIR: Having been requested by General Frederick Salomon, surveyor-general, and Colonel John B. Neil, register of the local land office in this city, to submit my views upon the several subjects of which the honorable Commission takes cognizance, I have the honor to submit the following:

I have been connected with the public land surveying service for about eleven years, in various capacities, as chief clerk in the surveyor-general's office in Montana and Utah, United States deputy surveyor and land agent, and therefore should know, from such a long experience something about the land laws of our country.

#### THE CLASSIFICATION AND SURVEY OF THE PUBLIC LANDS.

I deem the present classification under the following heads to be sufficient, viz: Agricultural, coal, mineral, timber, irrigable, and desert; grass lands are included under the first head, as also should pastoral lands.

The present rectangular system of public surveys cannot be improved upon as I can see, except in one instance, and that is to allow surveys of five and ten acre lots to be made in narrow cañons where the townships and section lines cannot be run, and allow

settlers to enter said lots by five or ten acres under the present laws; these lots to be numbered on the plats by lot numbers in red ink in each section, keeping up the township and range as now. By this means the good land can be surveyed and the settler can enter the land he wants without being compelled, as now, to enter not less than forty acres and thereby get more rocks and mountain than good land. I do not advise any departure whatever from the plan now used in designating the public surveys by section, township, and range. This plan is definite and sensible. No better plan has ever been devised. If a system of triangular surveys are instituted at this late day confusion in their designation and *locus* will surely arise. Note the confusion now existing in the triangular and even rectangular surveys of mining claims. Only allow the surveyor to make subdivisions into the five or ten acre lots above spoken of wherever necessary to take in good land and exclude the worthless, and you will have it; nothing further is required.

The present plan of surveying the public lands by contract has been carried on for a great number of years, and it is no small matter to devise or suggest a better plan to meet all the requirements of the government and the settler. The present plan, I must admit, has at times been abused by deputy surveyors, but I venture to assert that this service has been less abused and carried out with as much integrity as any other branch of the public service. No matter what errors are made the designation under the present system of any piece of land, no matter how small, can be made certain.

Under the contract system the deputy is paid so much per mile to make his survey and return his notes and plats. Out of this rate per mile he is to pay all of his expenses such as for instruments, his horses, wagons, camp equipage, assistants' "grub," breakage and damage of his solar compasses, &c., &c.—all to be paid for out of his own pocket, much of it months, and even years, in advance of his receiving a single dollar from the government; so that when his accounts are finally settled and paid the poor hard-worked deputy foots up and finds that he has barely made both ends meet. Now, as time is money with him, he must hurry with his work and make as many miles a day as possible. He cannot afford to stop and wait to see that his axman sets the corners correctly, as instructed; nor can he afford to watch his chainmen in sticking every pin and measuring every chain and taking the distance to notable objects. These men are sworn to do their work correctly, and so the deputy must of necessity rely on them; otherwise, were he to take the time to watch them continually, he would make but slow progress and come out at the "little end of the horn" financially; therefore he must hurry up and "make time." Herein mistakes and errors are caused which are corrected at once "within limits," and the surveyor hurries off on his line again.

Now, the only way I see to avoid this evil is for the appropriations to be made as now, only with much more liberality, for all the surveying districts, and to appoint one or more competent, skilled, experienced surveyors in each surveying district at a fixed salary (liberal), payable out of said appropriation, whose duty it shall be to enter into bonds and survey the public lands under the orders and direction of the district surveyor-general, making his returns as the deputies do now, receiving a fixed salary whether he is kept busy or not, the surveyor's expenses to be paid by vouchers, with accounts approved by the surveyor-general, out of the regular appropriation, and to hold the surveyor-general responsible, as well as the surveyors and their sureties, as to any fraudulent accounts submitted for payment. This plan would avoid the necessity of "making time" on the survey. The surveyor's pay would be the same whether he run one mile or ten in a day, and as he and his expenses are paid, he can afford to take the time to see that every corner is properly set and marked, and that true distances are given and that true lines are run. I therefore, if any change from the contract system is made, recommend the above plan as the most sensible, practicable, and feasible. The only argument against it will be, I think, the liability of rendering large fraudulent expense accounts and the difficulty of detecting them. I am satisfied that the surveys under this plan would cost something more than under the present plan, and they should in order to insure correctness. The practice of the government of late years has been to decrease the rate per mile for surveying and to more than doubly increase the labor, much of which is wholly useless and tends to impair the efficiency of the service. The manual of surveying instructions and all the subsequent instructions issued need radical amendment and codification.

It would be unwise to consolidate the surveyor-general's offices under one head at Washington. The people of the West would rise up in mass, and say no! The arguments against this are obvious to an unprejudiced mind. The surveyor-general and local land offices should be consolidated under one head. This would save the salary of two officers of \$3,000 each and the expense of making the triplicate township plats save office rent, fuel, furniture, stationery, &c. This consolidation should be entitled and named "United States land and surveyor-general's office." The officer in charge should be allowed a salary of at least \$3,500, the chief clerk \$2,400. A law clerk, to hear and govern contest cases and give his opinion thereon, and he should be allowed a salary of \$2,400. Other clerks could be employed as the service required, with

aries not less than \$1,500 per annum, one of which could be placed under bonds and act as receiver. As the money received must tally with the lands sold, there can be no room to make false or fraudulent returns of the cash received. This is my idea of consolidation; but as this plan would cut off a good many fat offices, it no doubt would be violently opposed if a bill for that purpose should ever be introduced in Congress.

The surveys under the deposit system work well. As an inducement to the depositor, the government should allow him a reasonable interest on the deposit money from the date of deposit until the triplicate certificate is surrendered in payment for land.

Desert, grass, pasture, coal, mineral, and timber land should be allowed to be surveyed under the deposit system, and the triplicate certificates received in payment for any land.

The price of desert and pasture land should be reduced. A party wishing to enter desert or pasture land unsurveyed should be allowed to deposit the cost of the survey, and the surveyor to survey the land only which the applicant wishes to enter, without, as now, being compelled to survey all the surveyable land in the township, and the depositor should have, in view of his advancing the money for the survey, some sort of priority of right in entering the land, provided there are no prior legal claims.

It has been suggested that desert, pasture, and grass lands be surveyed in such a way that each claim shall have a certain water front on a stream, lake, river, &c., making the center of the stream the dividing line between the claims, and the claims running back from the stream in such a way and in such a shape so as to include the land sought to be entered by the claimant. This plan would cause a departure from the rectangular system, which, as I have before remarked, would create confusion. My idea is to survey the lands sought to be entered by the claimant, under the deposit system, by section, township, and range; and if found necessary by the surveyor to subdivide into 5, 10, and 20 acre lots, and then allow the claimant to enter such lands as he requires, up to two sections more or less, whether in compact, contiguous form or not.

The present law governing the deputy surveyor in the field, requiring him to survey only certain surveyable lands and holding the surveyor-general responsible for such surveys, is difficult to follow, and should be repealed. How is a deputy to know what kinds of land his contract may cover? He cannot afford to go into the field and run lines of reconnaissance in advance of the letting of the contract to see if the lands are surveyable under the law. Neither can the surveyor-general do this; there is no law for it, no way he can be or even his expenses be paid, yet the law holds him responsible for the surveys, if they include lands other than those contemplated to be surveyed under the law.

It is true the law allows the surveyor-general to go out and inspect the surveys during their progress or after they are executed. This interferes with his office duties, and therefore he must examine, in a few days or weeks at most, the surveys which required three, four, six, or eight months to execute in the field. Such an examination is necessarily superficial and unsatisfactory, and really amounts to nothing.

My idea is to let the contracts—if the contract system is adhered to—and to allow the deputy to survey all the land covered by the same which he can chain and run over, whether it is arable land or not. This would save the uncertainty and confusion which now exist in the surveys and in the adjustment of the deputy's accounts. All the land must be surveyed sooner or later anyway, and it will cost no more now than it will fifty years hence; as a proof of this, the surveying rates are no more now for lines in open country than they were fifty years ago.

The following bill should become a law; it would save settlers much expense and litigation:

“ H. R. 3880.

“ A BILL to authorize the resurvey of lands where the surveys are fraudulent, erroneous, or obliterated, and to legalize a certain resurvey.

“ *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That the Commissioner of the General Land Office be, and he is hereby, authorized to resurvey the subdivisional lines of townships that were public lands and have been disposed of by the United States, and also public lands which remain undisposed of, when applied to for that purpose by a majority of the settlers being land owners in any township who have obtained titles to their lands, where the original surveys were made by United States deputy surveyors, but are proved, to the satisfaction of the Commissioner of the General Land Office, to be either fraudulent, erroneous, or totally obliterated in the field. The said Commissioner shall have the power to cause such lands to be resurveyed by a competent United States deputy surveyor, under the immediate direction of a United States surveyor-general; and where there is no such surveyor-general by reason of his office having been discontinued under the provision of section 2219 of the Revised Statutes of the United States, in that case the resurvey hereby authorized shall be executed by an experienced surveyor familiar with the system of the public land surveys, and to be designated by the county

commissioners or board of supervisors of the county in which the lands are situate, or by a majority of the voters of the township or townships embracing said lands, to be ascertained in such manner as the said county commissioners or board of supervisors shall direct, subject to the approval and the immediate direction of the Commissioner of the General Land Office; the resurvey to be executed in conformity, as nearly as practicable, with the field-notes, the lines, and corners of the legal subdivisions shown on the plats by which the lands were originally disposed of: *Provided*, That in the making of said resurveys no recognizable landmark or monument of the official surveys which mark the corner of any lands already disposed of by the United States Government shall be moved or disturbed, but, when so found, the said monument shall be renewed, and to be perpetuated as the landmark of the resurveys.

"SEC. 2. That the cost of the resurveys herein authorized shall be paid by the aforesaid land owners under the deposit system provided for by sections 2401 and 2402 of the Revised Statutes of the United States: *Provided*, That the whole expense of resurveying and marking the lines shall not exceed \$12 for every mile that shall be actually run, surveyed, and marked. And the plats of such resurveys shall be constructed in strict conformity to the field-notes thereof, and the description and contents of legal subdivisions shall be conformable thereto, be the acreage of the subdivisions more or less than that expressed on the original plat of survey by which the lands were disposed of.

"SEC. 3. That it shall be the duty of the surveyor-general of the proper surveying districts to transmit approved township plats of the resurveys hereby authorized to the registers of the proper land offices and to the Commissioner of the General Land Office, to be filed with duplicates and triplicates of the original plats.

"SEC. 4. That a resurvey of township ninety-six north, range fifty-one west of the fifth principal meridian, in Dakota Territory, as executed by H. J. Austin, at the request and cost of settlers therein and to their entire satisfaction, is hereby legalized: *Provided*, That the field-notes of the resurvey, when submitted to the surveyor-general of Dakota Territory, shall be found by him to have been executed in conformity to the existing laws, and in accordance, as nearly as may be, with the legal subdivisions of the original plat of the survey by which possessory rights may have been acquired by the settlers."

The government should advance a certain sum to deputy surveyors, before entering upon their work in the field, to enable them to meet the expense of their outfit without borrowing money from the banks at exorbitant rates of interest. This amount could be deduced from the accounts of the deputies, when the same were adjusted. The money advanced should be sent to the surveyor-general, and through him paid to the deputy, under proper instructions, or paid on checks of the deputy, for supplies, &c. The deputies and their bondsmen would be, of course, held for the money so advanced. This has been the practice in other countries, especially in Germany, and I am told that the practice was never abused.

#### SURVEYOR-GENERAL'S OFFICE.

The salary of the surveyor-general should not be less than \$3,000 per annum, and the chief clerk's salary in all important districts should be raised to \$2,000 per annum. The appropriation of \$1,500 for contingent expenses for the office in Utah is much less than that required to run and keep the office in good shape. An appropriation of \$2,500 for that purpose would be about the proper sum required annually. The appropriation for clerk-hire in the Utah office of \$3,000 falls short of even paying the chief clerk and chief draughtsman; the deficiency thus created, and the salaries of the other three clerks, must therefore be paid out of special deposits when such deposits happen to be sufficient for that purpose, which is not always the case. The surveyor-general should be allowed to make certified copies from his records, and be permitted to charge 22½ cents per folio for manuscripts and, say, \$3 for copies of full township plats, and \$2 for fractional.

#### PRE-EMPTIONS.

The decision of the United States Supreme Court in the case of *Atherton vs. Fowler* (6 Otto 513), virtually annulled the law requiring filings or entries to be made within three months in certain cases. It seems from that case that any person can settle upon the public domain and improve it without filing or applying for a patent, and hold the land against the world for any length of time. The decision and the statute should not remain in conflict.

#### FILINGS.

Where a party files a declaratory statement for a certain tract of land, and does not from some good cause, carry his filing to final entry, he should be allowed to file again provided he did not sell his right to the land described in his first declaratory state-

ment. As the law allows a person 160 acres under the pre-emption laws, he should be allowed to make a second pre-emption if his first entry was for a less quantity than 160 acres.

#### REPAYMENTS.

The law, as it now stands, allows repayments only when the land sold was illegally sold, or words to that effect. The law should be so amended as to allow repayments to claimants in every instance where the claimant, for any reason, could not obtain his patent. There are hundreds of cases where one party has proved up, paid his money for the land, and obtained his final receiver's receipt; in the mean time, before receiving his patent, his entry is canceled for some cause; then another files upon, enters the same land, and pays again the same amount of money for the land that was paid by the party who first entered. I hold this to be absolute robbery, and any one with common sense will say so, and recommend that the law ought to be amended and made retroactive.

#### PRE-EMPTION PROOFS.

The law now allows pre-emption proofs on final entry to be made before a county clerk, but compels the claimant to come into the land office to make his affidavit, no matter how far away he lives (often as much as 300 miles), while in homesteads the final proofs and affidavits can all be made before a county clerk. This is very inconsistent and absurd. The pre-emptor should have the same privilege as the homesteader, and therefore the law should be so amended as to allow the former to make his affidavit before the county clerk or a notary public anywhere in the land district in which the land sought to be entered is situated. I do not see why an oath is not as binding before a notary public as before a county clerk; and another thing (it is often so in this western country), that the counties are so large that the clerk's office is as far away from the claimant's land as the local land office, whereas a notary public could be in any isolated settlement.

County clerks should not be allowed to make out filings and entry papers for claimants and act as attorneys for them in any case. The local land officers cannot do so; then why should the county clerks have more authority than the register and receiver? Please have a law passed to this effect. County clerks make more blunders, any way, in land entries than any one else. This is patent to any one who has ever been familiar with the land laws.

#### HOMESTEADS.

The law governing homesteads should be as liberal to the settler as are the pre-emption laws. A pre-emptor is not required to make oath when he files his declaratory statement; therefore why should a homesteader? It does not make his first entry any more binding, as I take it. Make a law to allow both sort of claimants to file their declarations without being sworn, and let the final proofs cover the whole ground of proof as to residence and cultivation or improvement, the same as now done in cash entries. Where a party has made a homestead of less than 160 acres, he should be allowed to make another entry covering the deficiency up to 160 acres. Where, from some good cause, a party has filed a homestead, and for such cause cannot carry it to final entry, he should be allowed to enter again, provided he has not sold the land covered by his first entry.

Notaries public should have power to administer oaths in all homestead cases for the same reason as given under head of pre-emptions.

The following paragraph (page 6 of circular General Land Office of October 1, 1878) should be amended by law so as to read thus:

"Where the applicant is prevented by reason of bodily infirmity, distance, or other good cause, from personal attendance at the district land office, the affidavit may be made before the clerk of any court or notary public for the county or in the district within which the land is situated, under section 2294 of the Revised Statutes."

A homesteader who makes entry at the local office does not swear that he lives on the land. Then why, I ask, should he be compelled to do so before a county clerk? This is an inconsistency in the law which should be amended.

#### CANCELLATION.

When a claimant files his relinquishment of his homestead the land covered by said homestead should be made open to entry at once, without waiting for months for the cancellation to come back from Washington. Such a rule as this would facilitate business very much.

#### CONTESTS.

Where a party brings contest for abandonment, or any other cause, and the entry against which he brought the contest is canceled, the contestant should have thirty or

sixty days in which to file on the land. I think this nothing but justice. Many more contests would be instituted if the law was so amended, and many fraudulent entries thus prevented.

#### WITNESSES.

The witnesses in contested cases should be compelled to attend at the land office at the hearing. As the law now stands witnesses can attend or not. It is entirely optional with them. Many a contestant, and even defendant, have lost their cases because of this defect in the law.

#### COSTS AND EXPENSES.

The law compels the contestant to pay the expenses of contest. This is unjust. He should be required to pay the costs at time of hearing; but if the case was decided in favor of the contestant then the cost to be collected from the defendant by due process of law with which to reimburse the contestant for the amount advanced at the time of trial.

#### DATE OF HOMESTEADS.

Homesteads now date and take effect from the date of entry only. Why should not a homestead entry relate back to date of settlement just as well as a pre-emption? If a claimant has been living upon his claim for five years or over when he comes in to make his entry, why not let him have credit back for the five years, and not compel him to live five years longer? He might have settled upon unsurveyed land, and have lived thereon for twenty years, but could not make his entry until the land was surveyed and the triplicate plat filed in the land office. Now, as soon as the plat is filed he comes to make his entry, and as he has lived on the land over five years he asks credit for that time at least, and permission to make final proof at once without making the usual first entry. Should not his request be granted? This would only be simple justice to the hardy pioneer. Therefore, please have the law amended to cover such meritorious cases.

#### PUBLICATION.

The late law requiring claimants to publish a notice of their intention to make final proof is onerous, useless, impracticable, and should be repealed. What is the intent and aim of such a law? It does not require the claimant, nor does it authorize him, to state in his published notice to all the world to come in and file an adverse claim within the thirty days else all claims will be barred, &c. It does not even authorize the register or receiver to receive and file an adverse claim, and stay proceedings or order a hearing. I therefore ask, of what use is such a law? It benefits no one except the editors of one-horse country papers, who charge \$5 for publishing each notice of final proof. It is unjust to the settler, and just doubles the cost of making his final proof. But the worst feature in the act is to compel the claimants to name their witnesses in their published notices. We will state a case: Suppose A publishes notice that he intends to make final proof, and names B and C as his witnesses. After the thirty days' publication is up A searches for his witnesses, but cannot find both or even one of them. They may have died, got drowned, hung; may be in jail, penitentiary, or insane asylum; may have skipped the country between two days. This, you see, places A in a quandary. What is he to do about it? The local officers hold that Mr. A must make a new publication, and name two more fresh witnesses from the country. He does so, and at the end of the thirty days Mr. A again searches for his witnesses, but to his dismay or "bad luck" the witnesses are "non comatibus" a second time. What must poor A do now? The register would tell him to "try again," and keep trying until he brought in the two live witnesses, whose names were published in some little obscure country paper, away down in some obscure corner, with smashed type and pale ink, simply to comply with the law, which says that the notice must be published in the newspaper published nearest the land. I trust the honorable Commission will recommend the repeal of such an absurd law.

#### SOLDIERS' HOMESTEADS.

An old soldier or sailor should be allowed to enter 160 acres as a homestead by cultivating and improving the land without compelling him to live on the land in person—allow him to employ a man to reside on the land and improve it by proxy. I don't think any loyal person would object to such a provision in the homestead laws.

Section 2306, Revised Statutes, should be amended by striking out the words "may have heretofore entered," and insert in their place *have heretofore or may hereafter enter.*

## TIMBER CULTURE.

The law requires that not less than 2,700 trees per acre must be planted on a timber entry, and when final proof is made there must be at least 675 living and thrifty trees to each acre. The great difference in these numbers induces me to think that there must be an error in the original number of 2,700. I think it advisable to recommend that said number be reduced to 1,350.

## DESERT LANDS.

Where a desert claimant has made reasonable effort to get water upon his land and has failed to do so within the three years, he should be granted further time to make his final entry. Desert entries should be assignable.

## TIMBER LANDS.

Pre-emptors and homesteaders who still reside upon their original entries should be allowed to purchase 40 or 80 acres of timber lands situated anywhere in the land district.

## ACCRETIONS.

The lands of this class, regarded as accruing to the public domain by reason of the recession of the waters of meandered lakes, sloughs, and ponds, was treated of in the report of the honorable Commissioner of the General Land Office for 1878, page 138, in which he recommends that such lands be conveyed to the States, &c. This is all correct as far as it goes, but he says nothing in regard to such lands in the Territories. A law should be passed authorizing the survey of such accretions outside of old meander lines in the Territories under the individual deposit system, and allow the land to be entered as other lands.

## ROCK QUARRIES.

There is an uncertainty in the law as it now stands in regard to the entry of quarries containing building-rock, unless it is marble or limestone. The law should be made more definite on this point.

## MINERAL LANDS.

*Locations.*—Where a person has made a discovery and decides to locate his claim, he should have the surface lines run by a United States deputy mineral or other surveyor, and fix the *locus* of the claim by metes and bounds, with proper reference to natural, permanent, and local objects. After this is done let him write out his notice of location in duplicate, in conformity with the survey notes, post one notice on the claim and send the other to be recorded.

*Records.*—The office of district recorder should be abolished, and the notices of location should be filed in the local land office within the district where the claim lies. A proper form for notices should be drawn up by the honorable Commissioner and furnished the local offices for use of miners. This would preserve uniformity in all location notices.

*Width and length.*—Claims should be fixed at some definite width and length, say 660 feet (one-eighth of a mile) wide, and 1,320 feet (one-fourth of a mile) long, and should not be restricted by any local or district laws to a less quantity for lode claims, but allow the locator as much less than this as he sees proper to locate, and in all cases confine him to the mineral and land contained within the vertical side and end lines extended downward. This provision will avoid much expensive litigation, and the only thing that ever will. The end lines should be parallel, as nearly as may be, but where one claim butts up against another the course of the end lines may be governed by the course of the intersecting claim.

*Publication.*—The time of publishing notices for applications for patents should be shortened from 60 to 30 days, and no notice should be published in a country newspaper whose life is uncertain, notwithstanding the paper is the one published nearest the claim. The register and receiver should be the judges of this fact.

*Deposits for office work.*—Certificates of deposit for office work on mining claims should be made receivable by the receiver in part or whole payment for the land sought to be patented, and such certificates should be made assignable and used the same as certificates of deposit for agricultural surveys. This seems to be simple justice. As the law now stands it makes "fish of one and fowl of the other."

*Deputy surveyors.*—Deputy surveyors should have authority to administer oaths to their assistants and to parties who make affidavit of the identity of the claim, and the

proof of improvements; they should also be authorized to administer oaths in taking testimony mentioned in Circular N of the General Land Office of November 20, 1873.

*Applications.*—The practice of claimants of making applications for mineral lands by an attorney in fact has lately been overruled by the Acting Commissioner's decision in case of George S. Dodge, in Copp's Land Owner for November, 1879, page 122. I see that the law clearly sustains the decision. Mine owners may own claims in Utah and reside in New York, or some other distant port or inland town, yet the above decision requires them to come to Utah, at great expense, inconvenience, and loss of time, simply to sign and swear to their applications, when their agent, duly authorized, could do the same thing as well as the claimant, and in many cases much better. The ruling requiring the claimants to swear that their notices remained posted during the 60 days' publication is onerous and unjust, and should be set aside. If these two things remain in force it will materially impede the miners from making applications for patent. Such requirements are inconsistent with sound sense and good reason and the spirit of the times in which we live. Therefore the law should be promptly amended so as to allow claimants to apply for patents either in person or by attorney in fact.

*Procuring titles.*—The length of time consumed between paying for both agricultural and mineral lands and the issuance of a patent for the land entered is from one to two years, and, unless the claimant employs an attorney in Washington to hurry up his case, the time may be further extended. It requires two or three years to get a final decision on a contested land case. There would be many more contests brought against attempts to make fraudulent entries if a decision could be arrived at in such cases without so much delay. No doubt that this is partly or totally the fault of Congress in not making sufficient appropriations to carry on and keep up with the current work in the General Land Office. That sort of economy is false, and is an injury to the country as well as the individual who expends his means, labor, and life in the development of the agricultural and mineral resources of the great West.

*Mineral protests.*—The register and receiver should have authority to reject any protest if, after examination of the papers and hearing the evidence in the case, they find the grounds insufficient to support the same in law or equity. If in their opinion the grounds taken are good, let them so advise the defendant, so he can commence suit in court within 30 days from such notice. I don't really think it practicable to have contest in mineral cases referred to registers and receivers for judgment and decree, with the same force and binding as a decree of a court. This would require those officers to be learned in the law (which many of them are not) to sit in judgment on cases involving, frequently, millions of dollars. If a mine is of any moderate value the claimants can well afford to sustain the cost of a suit in a court of law having competent jurisdiction by which to defend their rights.

*Overlap.*—The practice of allowing claims to be surveyed which overlap one another should be discontinued. This evil is the source of much trouble and delay in working up the returns of the surveyor after reaching the surveyor-general's office, and if permitted to go on, as heretofore, the intersections will become finally so confused and mingled together, like cobwebs, that an expert would be unable to determine one claim from the other. This could be obviated by obliging the parties in interest to settle all conflicts in court before the surveyor made return to the surveyor-general. Such returns should be accompanied with a certified copy of the decree of the court. Such returns should be made in conformity with the decree, that is to say, the surveyor should return his notes giving the metes and bounds of the land which the court may decide belonged to the claimant, whether the end lines were parallel or not.

Where an application for patent shows none, or has no conflict on the day of filing in the local land office, but during the publication a protest is filed and carried to final decree in the courts, and decided in favor of the protestant, then the party who made application for patent (with his map clear of conflict) should be compelled to file an amended survey and field-notes, with the area in conflict, as found by the court, left out. This plan would not only greatly relieve the work in the surveyor-general's office, but it would wonderfully relieve the department in adjusting claims, and save so much delay in issuing patents.

If the foregoing suggestions are ever carried out, the laws pertaining to the public surveys and entry of lands will be as near perfect, I think, as it is possible to make them.

My duties, on account of press of business, have unavoidably delayed me in the compilation of this paper, but I trust it will not reach you too late to be of some service to the honorable Commission, and through it to the general public in the great West.

Respectfully submitted,

T. C. BAILEY,

Chief Clerk Surveyor-General's Office, Salt Lake City

Capt. C. E. DUTTON,

Secretary Public Land Commission.

*Testimony of General M. M. Bane, receiver, Salt Lake City, Utah.*

General M. M. BANE, receiver, Salt Lake City, Utah, testified on September 10, 1879, as follows:

I have heard the statements made by Mr. Niel and concur in them, but I would like to make a suggestion in regard to the timber lands. If they are to be disposed of they ought to be disposed of in alternate tracts, the alternate tract to be owned by the government, and the persons who bought a tract would protect the timber lying on each side of it. This would keep the timber supply a long time. The fires that are now raging among the timber result from three prominent causes—the hunters cause much fire by recklessly starting it in the timber to drive out their game; then the miners build fires recklessly; and the Indians sometimes set fire to the trees.

I have been very much impressed with the idea of making square locations of mineral claims, that is confining the claimant to the end and side lines. This would avoid litigation. Nine-tenths of all the locations in this Territory are made less than 200 feet wide and 1,500 feet long, that is 6.88 acres. In regard to the work of mineral surveys, the register and myself had been informed by Mr. Lawrence, a very responsible gentleman who obtained patents for two mines, that when he went to look for them he could not find their location at all.

---

*Testimony of George O. M. Boutelle, civil engineer, Salt Lake City, Utah, deputy mineral surveyor and late deputy surveyor of public lands in Colorado and Utah.*

Memoranda of changes suggested to be introduced in the practice of surveying the public lands of the United States.

To avoid as far as possible the always hurried and sometimes incomplete manner in which the work is done, and at the same time to accomplish a greater amount of work in a more thorough and substantial form, and at no greater expense to the government than at present practiced under the contract system, and to amend the "manual of instructions" so as to authorize the deputy surveyor in the field to do the work in the most convenient and economical way, the following plan is proposed to accomplish the desired result, viz:

The appointment of a competent surveyor of experience, with the pay and emoluments of a major of engineers, to be known as a deputy surveyor-general, whose duty should be to make himself perfectly familiar with the characteristics of the whole surveying district; to carefully ascertain by the closest personal examination and observation the necessities of the present and prospective population, with a view to the judicious and proper expenditure of the appropriation for public surveys for each year where it will be of the greatest good to the greatest number of actual settlers upon the unsurveyed lands where the wants of the people most require it, instead of expending the whole or a large portion of the money set apart for surveys in extending the lines over vast areas of worthless lands not susceptible of irrigation, and with no prospect of being required for occupation by a population for many years to come. The deputy surveyor-general should also be required to visit the parties operating in the field to satisfy himself by personal observation that the work is being performed in a proper manner and with due diligence.

To more fully inform himself regarding the character of the country and the proper places in which to locate the surveys for the ensuing year, the deputy surveyor-general should remain in the field after his inspections of the work of the regular field parties have been finished to run a sufficient amount of meridian and standard lines to enable him to judge of the amount required for surveys the following year to keep pace with the constantly increasing and expanding area occupied by the population, for the information of the surveyor-general. The deputy surveyor-general should be required to give bond (in the same amount as is now required of deputy mineral surveyors) for the faithful and honest performance of his duty and the proper disbursement of public funds committed to his charge.

The officer in charge of the surveying parties in the field and to whom is confided the duty of running, measuring, and marking the lines upon the ground, should be regularly employed (after passing a satisfactory examination before the surveyor-general and deputy surveyor-general) during his term of service in the field, with the pay and emoluments of a captain of engineers, and be required to give bonds for the faithful performance of his duty and the proper expenditure of such public money that may come into his possession.

The incidental expenses of parties in the field should be paid by the surveyor in charge of the party, who should be furnished with money for this purpose by the surveyor-general (from a small portion of the annual appropriation to be placed to his

credit for this use) to be properly accounted for by duly certified vouchers. The operations in the field should be confided only to those who would do a reasonable amount of work in each day, so as to make the expense to the government no more than it is now under the present contract system with the same amount of work performed and removing every inducement to the deputy-surveyor to slight his work in order to save himself expense, by employing him as a salaried officer instead of by contract as at present.

The poverty of the present "manual of instructions" in the matter of general instructions applicable to a mountainous country is manifest, and the necessity for which seems to have been lost sight of in the multiplicity of minor and unimportant details to the exclusion of instruction and valuable generalities. Many cases arise where the deputy surveyor is required to exercise his own judgment where no parallel case is given that could be made applicable, and although the work may be perfectly correct as far as the location of the corners is concerned, the deputy surveyor runs the risk of having his work returned "disapproved" and unpaid for because it was not exactly in accordance with any precedent set forth in the manual. The deputy surveyor should be left to a certain extent to the dictates of his own common sense, and if he be an officer of science, as he should be, methods of measuring the lines and establishing the corners at their proper place will readily occur to him without following exactly the manner of procedure indicated in the manual.

The present law requires that each of the north and south lines in the subdivision of a township shall be exactly eighty chains in length, except those closing on the north and west boundaries, and the limit of closing of the east and west lines, except those on the west tier of sections, is one hundred links. Instances often happen where it would be vastly more convenient and accurate to run west from the east boundary and then closing south on the southern boundary within the prescribed limit, returning and correcting the position of the quarter-section corner. In many cases time may be saved, and what is still more important greater accuracy may be attained than in following the despotic rule to require all lines bounding sections on the east and west to be run north. Should not the surveyor be left at liberty to run the lines north, south, east or west, as the case may be, requiring only that any two of the four sides of a section shall be equal and parallel? For convenience of reference the field-notes should be arranged as is now practiced, but the operations in the field need not be conducted in the same order as therein arranged where there would be increased accuracy by a departure from it. To the writer of this memoranda it occurs that next in importance to the proper establishment of the boundary monuments on the lines of the public surveys is to render them as permanent as practicable without too great an expense and to mark them in such a way as to be an improvement on "notching the stone corners" and intelligible to any explorer of ordinary intelligence. In townships where stone corners abound and where no posts are used it has frequently become necessary to retrace the lines of the old survey where all the stone corners were found to enable the surveyor to identify the township and range in which he was operating.

The writer would respectfully suggest that the corners may be marked in the following-described manner, to wit, by a stake two feet long and two inches square, and pointed on the lower end and driven into a hole in the ground prepared for that purpose at the exact corner point, the top to project one foot above the natural surface of the ground, to be entirely covered by earth thrown up from the pits, as now provided by law; the identity of the corner to be stamped upon a thin piece of sheet copper or zinc and nailed to the top of the stake with copper fastenings before the construction of the mound (and after the stake had been driven), which is to cover it and serve as its protection from fire or other causes tending to its destruction. The top of the mound raised two feet above the natural surface of the ground would cover the stake one foot on top, and would be sufficiently prominent to be easily found and less liable to be destroyed by the scratching of cattle against the post, as is often now the case. Whenever it becomes necessary to inspect the marks upon the little metallic card upon the top of the stake to ascertain its identity, a portion of the top of the mound could be removed, and after the examination carefully restored to its proper place on the mound. Corners of more than ordinary importance, such as points of intersection of base lines or standard parallels, with the principal or other guide meridians, may be marked with posts 2½ feet long and 2½ inches square. Section and all other corners, except quarter-section corners, to be two feet long and two inches square for the posts, the quarter-section posts to be two feet long and 1½ by 2 inches on top; this difference would also serve to distinguish the quarter section from the section stakes in the absence of any marks. Attention is invited to the following diagrams designed to illustrate the manner of marking the metallic cards to be placed on the top of the posts or stakes. It will be observed that the order of the arrangement of the marks on the cards is so unlike in the several cases that if one-half of the marks had been obliterated by time enough could remain to convey to an intelligent examiner the proper import, and enable him to determine what they were designed to represent.

Care being taken to so arrange the edges of the metallic cards that they shall be in the direction of the cardinal points of the compass, a general idea of the direction would thus be furnished to the investigator in the absence of any instrument with which to determine the direction of the lines.

The foregoing brief and imperfect outline of changes that might prove of advantage to the surveying service have occurred to the writer of this paper after an experience of more than a dozen years, partly in the field and partly in the offices of the surveyors-general in Colorado and Utah. It is respectfully offered for the consideration of the honorable Board of Land Commissioners in response to a published request for suggestions of this character.

I have the honor to be, gentlemen, your obedient servant,

GEO. O. BOUTELLE,

*Civil Engineer, Deputy Mineral Surveyor*

*and late Deputy Surveyor of Public Lands in Colorado and Utah.*

Captain C. E. DUTTON,

*Ordnance Corps United States Army,*

*Secretary Land Commission, Salt Lake City.*

SEPTEMBER 10, 1879.

*Intersection of the base line and Salt Lake meridian, to illustrate the design for marking the corners.*

*Regular corner on standard line, to illustrate manner of marking.*

*Closing corner on standard line.*

*Interior section corner.*

*Quarter section corner on a north and south line.*

*Quarter section corner on an east and west line.*

NOTE.—One and one-half square feet of sheet copper or zinc would furnish the necessary metallic cards for marking all the interior section and quarter-section corners in a township in the manner described above.

*Testimony of M. T. Burgess, civil engineer and mineral surveyor, Salt Lake, Utah.*

MICAJAH T. BURGESS, a civil engineer and mineral surveyor, resident at Salt Lake, testified September 7, 1879, as follows:

Have been familiar for ten years with the practical operation of United States land laws relating to lode claims. The practice of permitting mineral surveys to overlap is objectionable, because tending to confusion and litigation. The making of such overlapping surveys is, however, a necessary incident of the present system of location which permits of such original overlapping, and hence necessitates a similar conflict in the subsequent official surveys. So long as miners are permitted to make vague locations, as at present, and to follow their lodes wherever they run, conflicts will occur.

The common acceptation of the term apex is its highest point at any given place. The word presupposes a dip, and the highest point of a lode at any given place is hence its apex. This must be true in all cases where a lode has a dip, but there would be no apex to a horizontal lode. In case of dip there may be a series of points. In a vertical vein there would be a series of points also.

In Utah it is rarely the custom, in the early workings of lode claims to endeavor to determine the apex or cross or angle of a lode or vein, and it would be very difficult to apply a rule for the ascertainment of either uniformly. While there are some cases where it is a very easy matter to determine the dip of a vein without doing much work, generally it is impossible to do so without going at least 100 feet in depth upon it.

In view of the fact that under existing law the term apex, cross-angle, variation, &c., are essential parts of the law and in view of the further fact that the information necessary to determine the facts called for by these terms cannot generally be ascertained in the early location of a claim, in my judgment the rights of a locator are not sufficiently defined under the present law; and in a majority of instances they cannot to a reasonable extent be protected under existing law. Right here let me explain a little: The law seems to require that the locator of a lode marks his location on the ground very soon after the discovery, and the law allows the miners of a district to regulate the width of the surface ground within certain limits. Suppose the district law then requires that 100 feet in width shall be all that is allowed a locator and that very soon after making the discovery he stakes his boundaries. He is just as apt as not to get his location at right angles to his vein as to get it longitudinal to that vein. If he gets it at right angles he gets 100 feet of vein; if fortunate enough to get it run right he gets 1,500 feet. In the former case under decisions in this Territory he would lose all but 100 feet of his vein.

Since the passage of the act of 1866 or 1872 it is in my opinion impossible to determine the apex, cross-angle, &c., at the time of locating a mine, and much litigation has grown out of that impossibility.

I have known two seams running parallel or approximately so, being located by different parties, resulting in contests. I think a case of that character was decided here in court yesterday, that of *Stuart vs. Edison*. (Witness here entered into a lengthy description of the geology of the country and the location of the veins in controversy not relevant to the matter under discussion.) Continuing the general testimony he had not known of any instances in which the first locator had been cut off by the second locator.

Sometimes the outcrops of lodes are wider than the legal width of claims, whether as defined by United States or Territorial laws or local district regulations. This is so of the Flag Staff, South Star, and Little Cottonwood.

Sometimes the outcrops of narrow lodes so deviate from a straight line as to pass beyond the side lines of claims. Of this the Red Rover, in Bingham Cañon, is an example; and I know of a good many instances where the vein deviates from the course of location so as to pass off the location, but it does not come back. The Red Rover seems to run off and then run back. Generally the difference that troubles is merely in the direction of location of the lode.

In reply to a question whether it is practical, under the law, to secure the location of alleged lodes where mineral cannot be worked to advantage, but greatly to the disadvantage of discoverers of true lodes, witness said: The question is correctly put as predicated upon a matter of general practice, although upon the requirements of local law it is not. Local laws, as well as the United States mineral law, require that a man shall have discovered a lode, but they unfortunately leave the proof of discovery entirely to him, and as a matter of practice there is no restriction upon a man's taking up a lode claim upon absolutely barren ground. He simply has to come in and file his application, and claim so and so. Whether he has found mineral or anything else there, rests in his own breast, and it is left to him to say whether he has or has not, and he is given a license. This state of things works very much to the disadvantage of the real discoverer of a lode and to the advantage of blackmailers who make locations of something they allege to be veins, evidently for the purpose of getting money out of parties who think they have good mines. They simply make their locations for the purpose of acquiring fighting claims. In answer to No. 12 of questions relating to

lode claims, witness said a man could cloud the title of the true discoverer of a lode, and cause him an expensive litigation, but should not be permitted to do so. To show how this state of things might come about, and what difficulty the true discoverer of a lode would be put to in order to determine the identity of the true lode, I will say that B would allege that he had a parallel vein to A's, and would sink down until he passed into A's vein. In many instances he would sink through country rock and allege he was sinking on his vein matter; and finally, when he cut through into A's vein, he would begin to extract ore; and A would be compelled to show that his point of discovery and drift was upon the vein when B had entered his vein, and then prove in court, by expert testimony, that the other party could show no ore extracted between his alleged discovery and the point where he had entered on A's ore. This operation would cloud the title of the true mine for many years, probably. Witness answered affirmatively to No. 13, lode questions. In the event of litigation, as a rule, it is mostly over that portion of the vein which has passed beyond the exterior lines of the surface ground of the claim; but there are such variety of causes that there can be no rule stated. In the majority of cases, however, the contest undoubtedly results from the dip of the vein beyond the side lines—the plane lines. As a rule, and as a general thing, ore is taken out on the dip outside the plane line.

I doubt very much if it is possible to retain in the mineral law any provision by which locators could follow the dip of their claims outside their side lines without provoking litigation. There are so many excuses for litigation, so many crooks in practical mining, that I doubt if it would be possible to do away with litigation, so long as you allow men to go beyond the plane of their side lines on the dip of the lode. Conceding that under the present law the right to follow the dip is provocative of litigation, I can think of no safeguards that would prevent such litigation, or even its excessive increase.

Witness had never taken any part in organizing mining districts, and was only familiar with the mode of organizing them by description. As he understood it the question of citizenship need not necessarily enter into consideration in forming a district. Prospectors often travel in groups of three and upward, and they have an understanding or a rule among themselves that three of them have the right to organize a district and pass laws. They wander over the country and find something they want to record, and they organize a meeting, with perhaps only three persons. One of them becomes chairman of the meeting, another secretary, and they will proceed to appoint committees for the drafting of by-laws for the government of that district, and the committee will write out his notions of the boundaries of the district, and what the laws and regulations for the government of mining in that district should be, and these are presented to the meeting and adopted. Then one of the three is elected recorder, and instructed to get books to record claims in, and business begins. There is no safeguard to prevent the overlapping of districts and consequent conflict of authority, except that arising from the knowledge of other districts those meeting together may possess, and it is a mere chance of their possessing any. They generally take natural objects for their boundaries. I believe the requirements as to number of persons qualified to organize a district is a matter of custom and not of law; and it is only custom which requires that the organizers should be miners at all. The understanding seems to be that all prospectors are miners, and persons organizing a district are likewise assumed to be miners. I understand it to be true as a rule that districts are formed by small parties of prospectors, though sometimes they are organized by meetings of which notice had been previously given to miners, &c. In the absence of organization of a district, a man desiring to locate a claim would dig a hole and hold it with a pick, and would be governed by the dimension of his claim in posting up his notice, though I doubt if miners often post notices of their claims in the absence of a district organization. I believe they generally follow the custom of the last district in which they worked.

I have never known of any evidence of citizenship being required in the organization of these districts. I do not know of any law where citizenship is mentioned as a necessary qualification in those banding together to form a district. Such meetings generally elect a recorder, whose duty it is to keep a record of all claims that may be presented for record and to provide himself with books for that purpose, for which service he shall have a certain fee. Under the law he has to record a claim when it is filed for record. Sometimes the laws provide that he shall visit the claim after the notice is presented for record. That is not always done. As a matter of fact, the recorder records anything that is presented to him, for which the fee is paid. The object in keeping the book of record seems to be that there may be something perpetuated in writing to show that a party making a location has located the ground, and then the record is intended as a notice to other prospectors of that particular piece of land being occupied or claimed. There is generally provision made in the law that recorders shall keep their books open for inspection at all reasonable hours. What good it does I do not know; but unless there was some provision many locations might be made on top each other. A copy of that record of location, certified

by the mining recorder, is the foundation of the entire proceedings to acquire a mineral patent from the United States, and is evidence in any legal proceedings that may be instituted concerning that claim.

In answer to No. 16, questions on lode claims, witness stated that any man who wants to locate a piece of ground takes a piece of paper and writes a notice, perhaps the best he knows how, and takes it to the district recorder's office and files it with the record, paying \$2, which is the fee in most cases; and if that notice is found to be very imperfect, in some instances it is modified by the district recorder, at the request of the locator, so as to make it conform to what the district recorder believes to be the requirements of the act of Congress. Some district laws say the locator shall erect a monument and two stakes of a certain size, and I think some of them go so far as to say they shall do certain work, but as I understand it that is not the rule, and those forming districts now very generally insert a clause in their district laws adopting the United States law as the general guide, and only make rules for matters of details. The filing of the certificate or notice with the recorder is the main thing. The filing of the certificate does, I believe, hold the point of discovery against other parties until the locator leaves the ground, and then just as likely as not another party will make another location that will take in this point of discovery; but so long as the original party is on the ground that notice is apt to be respected. That notice is the foundation of all subsequent proceedings relating to the title of the claim, and it is the first step toward obtaining a patent for the land. In the matter of any controversy respecting boundaries, the controversy would also hinge upon that certificate, and I believe that the litigations necessarily occurring in relation to mineral titles are enormously increased by the illiterate or careless manner in which these locations are originally drawn.

I do not personally know if that record is capable of subsequent amendment (after it is filed), but have been informed by some district recorders that they would allow any record of location to be amended, if the party making the location should apply to do so within a reasonable time; and it is subject to amendment at any time by filing what is called an addendum notice or additional description of the ground. I have known that to be done in cases where the claim was several years old. The original notice is not necessarily touched or mutilated by this amendment. In many cases after the original notice of location is recorded the party wants to furnish the public with an additional description of the ground, and he files an amendment notice and that is also recorded and forms part of the record. No questions are asked as to the description he files.

In many mining districts I understand there are provisions in the laws which allow of their amendment under certain conditions on due notice, but I do not understand the modifications could interfere with acquired rights.

Question. Suppose that all the miners in a district wish to change the size of their claims, would not it be competent (by a two-third vote) for them to come together and reach that result?—Answer. That is an extreme case, and I have never known such a case as that. I have known of laws being repealed, but never of their repeal being made retrospective. I cannot say it is within my knowledge that mining titles have been disturbed or eradicated through the fraudulent manipulation or destruction of mining records, though I have heard such things intimated. I do not think there is any security against such a practice, except the honor of the district recorder. The records are in his possession and he may manipulate them if he wants to. He is not under bonds nor under oath, and there is only the security of his personal integrity.

In answer to question 19, lode claims, witness stated that in his opinion the initiation of record title to claims could be advantageously placed in the hands of federal land officers as regards general results, but that it would likely work a hardship to individual miners, because a considerable interval must then necessarily elapse between the discovery of the claim and the recording of it. It would be necessary to have mineral discovered in a particular district, else there would be no federal officer present to make the record. It would be impossible to have a federal recorder in every mountain district of a mile or ten miles area, and in their absence prospectors would risk losing their claims, because they would have to notify the proper authorities that they had found mineral, and some one would have to be sent into the neighborhood to make a record of it, involving a delay often of weeks and months, when the man must be away from his claim hunting a federal recorder. As it is now, the districts are hardly ever larger than six miles square, and he need lose but little time in making his record—hardly ever more than a day—and hardly more than that interval elapses after the discovery of mineral before he seeks and obtains a record of his find. Among miners a record in a district office is much more generally respected than a notice posted on a claim. The fact that he has been to the district recorder's office and filed his claim for record is considered to give him a much better status than the mere posting of a notice. The result is that it would be a mere question of administration. Whether he filed with one man or another would not matter if he had the same facilities afforded him in either case, and it would be better for him to

file it with a United States officer than with an irresponsible recorder, if it could be done with the same speed; but no system should be adopted that would increase the delay or difficulty in securing a record of a mining claim.

As regards the inquiry whether requiring the record to be made with federal officers would not lead to greater benefit to the greater number by giving them more security for a proper record and in that way do away with litigation, I hardly believe in the greatest good to the greatest number; I believe in protecting the man who finds the mine, because without the discoverer we would not have mines at all. It is frequently stated that the professional prospectors do not derive benefit from their discoveries, but I have known a great many who have received a great many thousands of dollars for their rights of discovery. I think the present system loose and incomplete, and would prefer another if it could be arrived at without oppressing the class of people who find mines; but I would not advocate a system that would leave them without a record of location even for a short time. Miners very often go great distances from old districts, and it would be impossible to have a federal officer follow every group of two or three men wandering over the country in search of mineral. I think the system would be a judicious one generally, but I would not favor any system that would work oppressively to the prospecting classes.

There is no limit to the present system to which the record of location runs, as I understand it. At the present time a man may hold a mining claim for a lifetime under a notice of location. As regards the perpetuation of that system, I think it would be good with some modification—i. e., that he hold the ground by a certain amount of work annually, and I would see to it that he actually did the work by a system of inspection by United States officers. The officer would not be required to be there until the district was populated to some extent, and he would not necessarily be in a certain locality all the time. What I mean is, that I would want it to be the fact that at least the claimants in a mining district actually did work, instead of representing that they did, and I would secure knowledge of the actual facts by some system of inspection. I would not leave it to the miner to say whether he had done the work, because in many instances claims are revived after they have been abandoned for years, for purposes of litigation. I do not think this theory of inspection would involve such a multiplicity of officers as to render it useless. It would not in the Territory. It would be a very easy matter to inspect the work of all the mines in Utah.

Q. Have you any idea of the number of locations in Utah?—A. I know what is said to be the number in Bingham.

Q. How many?—A. Five thousand five hundred. That represents about four square miles of territory.

Q. Now, extending that in similar proportion— A. That is an exceptional case. You might go many miles where you would not find any location at all. Applying that to all the mineral districts in Utah, I think it would be practicable to obtain the requisite number of officers to make the inspections proposed. There should be an officer appointed for each one of the mineral districts. I do not know how many districts there are—probably 40 or 45 now. There were 37 in 1873.

Q. Then you would have in this one Territory 45 officers, to be paid for the mere inspection of mines developed. If that system were followed in each of the other States and Territories, would you not have a machinery that would render it impracticable?—

A. I think not. I do not consider the question of expense should enter into this matter where the government is to pay for it. It is like the system of surveys; it is only impracticable because Congress will consider the matter of expense.

When I spoke of some modification in the present system of protecting prospectors' rights I had in mind an amendment to the mining laws, making known explicitly what the government requires in the matter of location, and not leaving it a matter of judicial construction; to make it perfectly plain to any man who engages in mining, and require him to strictly comply with it in making his locations, and have definite instructions published as to the manner of marking claims on the ground and as to the method of describing them, a neglect of which rules should work a forfeiture of his claim, which forfeiture should be determined by some officer appointed for the purpose. That duty might be imposed upon the mining inspectors.

Q. Suppose that officer decided that the location was not valid, inasmuch as the recorder is not a United States officer, what jurisdiction would the inspector have to take that record off his books?—A. It would not make any difference as long as the record was pronounced insufficient.

I am not elaborating a system for adoption, but am simply giving my idea of the best method of modifying the law. The act of 1872 requires that the location shall be so distinctly marked on the ground that its boundaries can be readily traced. No prospector knows what that means. Some construe it one way and some another. That is the fault of the law.

I am in favor of the repeal of the present mining laws and the substitution of another that would require the rectangular subdivision of the mineral lands of the country.

and I would have this rectangular subdivision to be of ten acres, in squares, and I would allow each prospector to locate from one to four of these squares, and I would have the plane of the side lines of this rectangular subdivision limit his right to the vein contained. The area of a mining claim made in one location of 40 acres would be 1,320 feet square. That, I think, would come as near doing away with litigation in connection with mining claims as anything I could think of. I repeat, I would allow a miner to take one to four of these locations, at his option, and for convenience in surveying I would make the locations in squares—not to include more than 40 acres of ground. The limit would be one-quarter the size of a quarter section of land, and the smallest quantity would be the smallest legal subdivision of land.

Such subdivisions as that above suggested would cut off the vein on the dip, the depth depending on the angle at which the vein dips. No two veins are alike. They run at different angles. If the apex of the vein was absolutely at one side of the location, and it went down at an angle of  $45^{\circ}$  from the horizontal, the depth on the dip would end at the square root of the sum of the squares of the two sides. Without figuring I cannot say exactly what it would be. Approximately, if the apex of the vein and one of the sides of this 40-acre tract coincided, and the dip is  $45^{\circ}$ , you can follow the dip of that vein 1,863 feet without going outside the tract, and under one location that would be the extent to which deep mining could be carried. If the vein pitched steeper you could of course go deeper, and if the pitch was not  $45^{\circ}$ , less. It is very seldom in this country that a vein has a less pitch than  $30^{\circ}$ . Presuming the apex to be at one side of the location, under the worst circumstances you would have 1,320 feet depth. I do not think such a restriction would give the death-blow to deep mining. The cases are so rare where any one goes down 1,800 feet on a vein that it is hardly worth naming. In this country, at least, it is very rare. The Comstock might be named as a noted exception. I am satisfied there is not a mine in Utah, Idaho, Montana, and Wyoming that is 1,800 feet in depth. I do not think that a system that would allow 1,800 feet and upwards on every vein, would interfere materially with the development of deep mining or defeat the investment of sufficient money to make it profitable in this country. If a mine is worked 1,000 or 1,200 feet its owners can form a very correct idea of what their vein is going to be for the next thousand feet, and then it would become their duty to purchase more land. They might make a second location to protect their dip. I am disposed to allow a man to have all the mining land he will work. I would give him more land to protect his work than under other circumstances. Even though you allow a man to make an immense location you cannot require him to do more work on it than he pleases. The chances are he will not utilize his own land and will not allow others to do it.

I consider mining at 1,200 feet tolerably deep mining, and I hardly think restricting a man to so much land as would allow him to go that deep would interfere with deep mining to such an extent as to retard its development or prevent the investment of capital in it.

As a matter of general policy I think that there should be a limitation as to the possessory title in mineral matters, so as to require them to perfect title within a reasonable time.

The law in relation to tunnel locations is a dead letter any way, and in the event of the adoption of my side-line suggestion it must necessarily be repealed. It might as well be repealed any way, for they have never struck any veins in the tunnels in this country. I do not know of the discovery of any such vein. I have heard rumors that such veins have been struck, but they have not been authenticated so far as I know. The only good tunnels do, they sometimes drain and assist in the working of mines. I do not know whether or not there have been any decisions by the courts in this Territory as to the rights of parties under tunnel locations.

In regard to mill-sites, I might say that mills are erected for several purposes; sometimes for the purpose of controlling the stream of water, and at other times for the purpose of putting mills up for the use of mines. Sometimes they are erected for the use of smelters or mills, and sometimes for speculation.

Within my knowledge the purposes intended by the law are not carried out in the location of mill-sites in any considerable number of instances. As regards the continuation of the mill-site privilege, I do not know that there is any real good, nor generally any great harm, in the law. If a man wants to put up a mill he can generally find a place to put it on without a mill-site. As I understand it, the law requires that land taken up as a mill-site shall be non-mineral and non-adjacent to the end of a mining claim. If not amended, the law should be enforced.

*Testimony of L. S. Burnham, Bountiful, Utah.*

L. S. BURNHAM, of Bountiful, Utah, testified at Salt Lake City, September 15, 1872, as follows:

The suggestions I have to make are simply on agriculture. There are many little evils we have to encounter here under the public-land system that are not known in other countries I have lived in.

I am a Mormon, but not a polygamist. I have for twenty-five years been acquainted with this community system. The system of disposal of our agricultural-land rights here has been entirely different from the one prescribed by United States laws, as I was familiar with them from having been twelve years in the business before I came here.

For many years we were not permitted to make any land claims except with the consent of the church. We could not take lands under the United States system up to the time the railroad got in here. The lawyers came in here, and a multitude of fraudulent claims have been the consequence, since the United States land office was established here. Everything broke loose then. The people could come in then and make filings according to law. Since the land office was opened, in 1869, an immense number of fraudulent filings have been made, and have led to an immense amount of litigation and mischief to the people. In more than one instance there has been a strong effort made to carry out some filing, especially on the part of the church.

Twenty-five years ago I wanted to take a piece of land here in Utah. I went and selected a piece and told the bishop that I wanted to go on to a piece of government land. He said, "I shall not allow you to go on to it." I said, "What is the matter?" and he replied, "You won't be permitted to touch it." They gave me no other reasons, only that. Then I tried another piece, but I met the same answer, until I learned that it was the ruling and custom here not to allow any person to take up a piece of land except by the bishop's sanction, and then it was advisable to take only from 10 to 20 acres.

Sometimes individuals who were favorites could go and take out other pieces of land; it depended on a man's standing in the church. When the land office was established a multitude of filings were proved in the end to be simply forms to prevent anybody going on to the land thus covered. A great part of them were homestead filings. The records of the office will show it. We found it necessary, in order to enter any kind of claims for homes for ourselves or pieces of ground, frequently to go outside of all that was called decent land. These old filings had become obsolete, for the parties never have been on them, making declarations in some way, and whenever there was an opportunity offered to take them we had to go through the forms of law or else hire them cancelled, although the time had expired. To hire them to send for the cancellation papers was the cheaper way. There was a multiplicity of fraudulent claims held over the whole country to keep the Gentiles from taking part of the land. We found that we could only accomplish that sometimes, for while waiting for return of cancellation papers from Washington to this office, which is the law, parties would come just in ahead of us and whip us out of it.

The first suggestion I had to make was that it seems as if the one who had obtained the cancellation of such old fraudulent claims was in possessory right, and ought to have a few days given him, if it is not more than two.

I think the local offices here should be permitted to manage the whole matter. The little humble farmer, who has only a few hundred dollars, and has to reach this thing inch by inch, it ruins him. I am on a desert-land filing. I had obtained the cancellation of a quarter section of land that was an old fraudulent filing. It cost me \$35 to get that canceled. I sent it to Washington and it was returned. I had my attorney employed here, as I cannot be here all the time, to manage it for me. I had the money deposited at Walker's bank, subject to the orders of the attorney, but as soon as the papers came in, canceled, another party came in and gobbled it, and they probably got a letter from Washington about it.

If the officers here had the authority to make the cancellation, upon the proof that I had filed, I would have been protected. I would have saved my money, and obtained my land. The individual that heard of this filing and stepped in ahead of me made a desert filing and took it up, I think some years ago or more. He has made no use of the land at all; I have since been over there; he is a member of the Mormon Church, but of course I cannot charge it to the Church.

I came here from Vermont because I believed in the principles of the Mormon church, and that it would make me a better man, but the practice and professions of the church do not agree; I am a Mormon but not a polygamist.

I have a wild suggestion to make, and it is this: In consideration of extreme difficulties and antagonisms, mostly by foreigners who now inhabit Utah, and the extreme prejudice on account of the teachings of the church against the economy of the government of the United States, in her method of disposing of the public lands, I would suggest that there be a commissioner over a certain number of land offices, who would bring up all land matters, and adjust and settle them, without the long

course of litigation that now exists in Utah. I have studied this matter for years and such a commission with appropriate legal authority would end a host of trouble for the poor farmers. The commissioner not to receive fees, but a salary; thus guarding him against anything like bribery. If it could have been so in years past it would have saved a terrible sight of feeling and prejudice which has been created against the government.

I am opposed to any pasturage system, and to the giving of 3,000 or any large number of acres to any one. My reasons are, that these dried-up and burnt lands are susceptible of becoming very valuable lands by boring artesian wells. I have tested it. I am at it now, and the result, as far as I have carried it (and it is only the beginning), has been a great deal more favorable than we expected. I am 9 miles north from Salt Lake City. I will give you my theory. As dry as it is—and it is the driest we have ever known it here—it has dried up millions of bushels of grain, still we bore down 10 feet with my little auger (which is my own invention) and we strike water. It is only a few miles from Salt Lake City, but we find it is not the seepage from the lake. We find that it is the gradual underflow from the mountains. It is fresh water; therefore it comes from the hills. It is fresh water and does not come from the lake. Salt Lake never seeps back. The water from the hills is forever crowding towards Salt Lake. In testing the matter we found this to be true. In boring 10 feet we struck water; in boring 50 feet we got enough water to run off a little stream. Forty-five feet would, perhaps, just make it stand level at the top. The formation we bore through is simply stratified clay; it is a mud deposit in the water. It is a stratified, regular formation, as if it had been deposited just so much each year, and as we pass through there is a little quicksand between two stratas, and in that quicksand there is a little water. Below that you reach another strata, and getting lower, you reach another. That is the theory we work on, and we find that it is the correct one. The theory appears proven as far as we have gone. We think we can get a flow after awhile. This will redeem these lands.

Another thing I wish to state: we have a worse enemy to encounter than the drought, and that is the terrible alkali beds. It takes science somewhat to master that. The alkali beds, so far as my knowledge and experience goes, cover almost all the desert lands in Utah. The waters contain a greater percentage of saline matter than they do on the other side of the range. Our waters carry from 7 to 10 per cent., and on the other side of the mountains they carry from 4 to 6 per cent. The alkali seems to be almost entirely on the top. It consists of all varieties of saline waters. There are more than fifty varieties of it. The fresh water, forever working towards the lake, becoming permeated through and through, is always carrying this saline matter, which is low down in the earth, right into Salt Lake. On the top it (the water) is never so strongly impregnated. When Salt Lake receded it left a great deal of saline matter near the surface. It impregnated the soil so strongly that we had years of trouble before we were able to raise cabbage; but when we do get it, it is the richest land in the world. The most effectual method of getting rid of it is the niter, which in rain and snow neutralizes it. It is better for it than anything we have ever tried. It seems to neutralize it without running off. Then we use the spring floods in the mountains. We wash it a great deal that way. We wash the soil when the spring freshets result from the melting of the snow. That is one of the best ways we have of removing it from the soil. You see now why I am opposed to the pasturage homestead, for I think these lands can be utilized for agricultural purposes. The pasturage homestead law will have a tendency to monopoly. A man would take up a thousand acres of land in this way, and would be likely to let it lie idle for many years. If a man had 1,000 acres he would not do anything with it.

Under the present method we take five acres and subdue it, and next year we take another five acres. I could not take a thousand acres or a hundred acres and do anything with it. We farm about 91 acres of land. The church used to pester me, but they do not bother me now. I made an effort to take this land fifteen years ago, but they would not let me. President Brigham Young spent more than \$200,000 of the church money redeeming that land, and it has failed since he died, and they abandoned it. We have not been allowed to file on it. They proposed to bring the water of the Jordan and Weber Rivers on to it, but they failed.

Another thing that I would suggest, that would do away with much of the difficulties surrounding the land question and bring the greatest amount of prosperity, is, that a commission be appointed to settle all these Mormon land titles. It would defeat every kind and character of foreign and domestic prejudice as to the economy of the system of the United States land laws.

*Testimony of John Ward Christian, attorney-at-law, Beaver City, Utah.*

BEAVER CITY, UTAH, September 22, 1879.

*To the Public Land Commission :*

GENTLEMEN: In answer to your interrogatories, I am unable to respond to all at once, but will now answer to your first ten general interrogatories, and will answer to those under the heads of agriculture, timber, lode claims, and placer claims hereafter, as my time will permit.

1. John Ward Christian; Beaver City, Utah; attorney-at-law.

2. Twenty-one years.

3. Have not.

4. Assisting various parties in procuring their land titles.

5. Homestead and pre-emption entries; usually from six to twelve months after making final proof. The expense depends usually upon the distance of the applicants and witnesses from the local land office. Places for making final proof should be increased and rendered more convenient to parties. In contested cases, no definite time can be stated. In the case of Ashworth vs. Buckner (from this county), the contest lasted three or four years; the expense, including attorneys' fees, about \$3,000 each. Since Ashworth drew out of the contest, Beaver City has taken up the matter of contesting Buckner's right to the same land and it is now pending in the land office. This land is worth about \$2.50 per acre.

6. I have. One defect is in allowing more than one person to file a pre-emption entry upon the same tract. Another is in allowing parties to change from one entry to another; another is in allowing parties to abandon one entry or any number of entries, and make others. But one entry or filing should be allowed, and the party forever barred from making others, even if not perfected. This would limit contests and prevent speculative attempts.

7. In answer to this interrogatory, I will have to confine myself to this county (Beaver), owing to want of time and opportunity. The east boundary of this county is the summit of the Wasatch range of mountains. The west line is the east boundary of the State of Nevada. To the westward of the Wasatch it is a succession of small valleys (some fertile and some desert) and alternating hills and mountains, and high and barren table and bench lands, with but few streams and watering places other than the Beaver River and its three or four tributaries, to wit, North, Indian, and South Creeks, neither of which approach the Beaver during the latter summer months. The Beaver and tributaries all emerge from the western slope of the Wasatch—are flush during spring and early summer, owing to melting snows; but ordinarily during the irrigation season all of the waters of these streams are appropriated within a distance of 25 miles west from Beaver City and within 35 of their sources, the final appropriation of these waters being at the town of Minersville, 20 miles west of this place. The benches, foot-hills, and mountains west of Wasatch are, or have been to a great extent, covered with a species of scrubby cedar and piñon pine, fit only for fire-wood and for a character of fencing termed in the West "bull fence," built of stakes thrown across and riders thrown between, and vulgarly termed "rip-gut fence." These benches are very generally covered with "bunch-grass," except during dry seasons or seasons when the snowfall is light in the valleys and upon the benches west of Wasatch. The valleys near the streams are usually covered with a low underbrush called sage, rabbit, and grease brush, and in very damp places willow brush, with but little grass only upon low places where water overflows during the early part of spring seasons. All these valleys are in fact desert lands, or were twenty years ago, but when reclaimed by the application of water make good grain, hay, and pasture lands. The scarcity of the water is the great drawback, as the more valuable lands are not so situated as to admit of being irrigated.

The future of this county, and Southern Utah I may say, lies in its great mineral wealth, which is now being somewhat developed. The farm and garden products are not sufficient for the home consumption. As a pastoral district, our great trouble is lack of water at places where the best stock and sheep ranges or districts are. The great scarcity is during the summer and fall. After snowfall stock follow up the snow-line upon the mountains and subsist upon the snow.

The chief and in fact almost the only source for building and fencing timber is the Wasatch Mountains, which have heretofore afforded all that has been used, with but little exception. Its supply of saw timber is now very limited on the west side, yet there is plenty of small cabin and fencing timber, &c., but very difficult of approach.

8. As to the best method of disposing of the public lands now unappropriated in this county and in all other districts similarly situated, outside of those upon which cereals and hay can be grown, is to sell them to parties wishing to purchase, in such quantities as they may desire, at the government price, upon application direct to the Land Department. If they are not thus disposed of, the mining interests of Southern Utah will soon consume all of the scrubby cedar and pine forests for charcoal, which

is very extensively used in smelting ores; and these growths are, from my observation, not restored by new growths; otherwise these forests will become vast unma-tured commons, and unsalable. A strict stumpage law—i. e., so much per ton of coals—collectible from the consumers (the deliverers are too numerous to reach) might answer.

9. I know of no better system than the one adopted by the United States.

10. In those portions of the West situate as this and other Territories are, so far as my acquaintance goes, and especially this, Nevada, and Idaho Territories, and most of Arizona, where parties taking up farm lands have to procure their building and saw timber from the high mountains (their farms being low in the valleys), I would suggest that they be allowed to take, say, 100 acres in the valley and 80 up in the mountains among the timber, and thus parceling out the timber and thereby giving individuals power to protect it from merciless speculators in lumber, mining timbers, and railroad ties, and from fire, &c., thus throwing vast personal interests together, and thereby protect the general interest of the whole republic. Owing to a lack of some such arrangement, millions of feet of lumber have been cut and shipped from the western slope of the Wasatch in this county, during the last ten years, to Nevada and other places; and this mountain range is our only hope in future for all our mining and building materials, for supplying our mining and agricultural interest to its west—and west of this range are nearly all of our principal mining camps in Southern Utah.

Respectfully, &c.,

JNO. WARD CHRISTIAN.

*Testimony of Daniel Davidson, sheep raiser, Salt Lake City, Utah.*

DANIEL DAVIDSON, of Salt Lake City, testified, September 17, 1879, as follows:

I am a sheep raiser. My sheep ranche is on White River. I have about 29,000 sheep. I think five sheep will equal one beef. I think it would take 30 acres to graze five sheep. The country where I am is very mountainous. There has been plenty of water, but it is scarce now. I range over a space twenty miles long by four miles wide in the summer, and in the winter I go to another place, having about the same area. Two ranges are indispensable. In summer I drive up into the mountains, and in winter I drive down into the deserts. I do not own the land I range on because I cannot afford to pay the government price. It is unsurveyed land. I could materially increase the value of my flock if the land could be fenced in some way. The advantage would be I could move from place to place and keep others off. Then I could herd, and put in tame grasses, and make improvements generally. This land is not worth anything but for grazing purposes. I have great trouble to prevent people from causing their cattle to eat off the range. Sheep and cattle do not do well together, for the reason that the sheep nips the grass much closer to the ground than cattle do and eat the grass all off so that the cattle cannot get any. The idea that cattle will not graze on the same ground that sheep have grazed over is not true. I have seen in the east where sheep and cattle will do very well together if the pasturage is not overstocked. Where they are overstocked the sheep will take the grass all away from the cattle. Sheep will graze on the mountains where cattle will not. The ranges are steadily decreasing under this present system, but if I could own the land I could make the pasturage increase. I would then have an interest in making it increase. Last summer I went to work and fenced in a piece of grass. I should think about 230 acres. That is all the land I have fenced. I thought I was safe; that others would not come in; but other men came along and let down the bars and put their stock in my inclosure. They had just as much right to it as I had. If I owned the land I could then keep it up and improve it.

There is some conflict between the cattle and sheep men. The herds will run from 2,000 up to 16,000; mine is the largest herd. All the other herds in the Territory are about 8,000. They run in bands of about 2,500.

I think these lands should be sold. I think it would be to the advantage of the government and the people if they were sold. It would, I am sure, be better for all parties. I would sell them at a nominal price—at 10 cents per acre. There are thousands of acres that are not worth much for anything. The stock-water privileges are pretty well taken up. It (the water) is stocked about as well as it can be. I think I would sell the pasturage lands in unlimited quantities. I think the pasturage-homestead idea is a very good one. I think whatever is done should be done at once. It would be a great deal better for all parties concerned, better for the government and for the people. The government is getting no revenue from these lands, and the people are getting in all the time and getting the benefit of them. They take the timber off these lands and use it, and the government draws no revenue from them.

Sheep pay better than cattle. I have been in the business twenty-five years. Sheep will pay 60 per cent. I have made as high as 80 per cent. a year. Cattle will not pay more than 40 per cent. My shearing from 18,000 sheep nets \$24,708. I raised from them 9,400 lambs. They are worth from \$1.50 to \$2 per head. The wool sells for 20

cents a pound. When I came here in 1871 they had the poorest sheep here I ever saw. They were the Mexican sheep. I went to Canada and bought some large English sheep and brought them here. Brigham Young sent one of his bishops down to see them (in 1872), and the next morning a letter came from his secretary for me to come to the office; and he said he had been down along with the bishop to look at my lambs; and he said, "They are going to be a great acquisition to this Territory." I told him that was what they wanted to improve the stock, and he said, "Don't you want to sell them?" I would not part with them to any man, but he insisted that I should sell them. I said that if I did I would have to go back to-morrow morning for more, and he told me to go on and get more from Canada; and he said, "I will sell the sheep for you." I went back the next morning to Canada, and I had not been there two days when a man by the name of Van Atten came there. I bought two car-loads; he bought three. I got a dispatch from my wife saying that none of the sheep were sold and that I had not better buy but one-half a car-load. I came home. They had not sold the sheep, and they never tried to; they did not want to. They thought it would cripple me by making me buy so many sheep. The man told me that he and Brigham Young were in partnership. They wanted to keep me out of the business. I bred from them two years, and then sent to Ohio and bought merino sheep, and have been using them ever since. The sheep here all have the scab, and it is ten times as bad as in the States. I use tobacco and sulphur; ten parts of tobacco juice and five of sulphur. I use them every year, scab or no scab. You cannot sell scabby wool. I employ twelve herders and pay them \$30 a month. It costs me \$18 apiece to feed them. This is not an agricultural country; it is a pastoral and mineral country. The only disease the sheep have here is scab. The alkali here cures the hoof-rot.

SALT LAKE CITY, September 11, 1879.

JOHN B. MILNER, of Provo, Utah County, Utah, made the following statement:

I am a farmer; I have been a farmer in Utah for twenty-five years. I live in Provo, Utah County, which is an agricultural county; I have lived there for twenty-five years. I own a tract of land, on which I live. I have myself personally attended to its cultivation, though I am now a practicing attorney. For several years I was county surveyor of that county. The corner posts having been lost, I had to resort to the records of the county survey, because the survey had been made some thirteen years and the stakes were mostly gone, having been of the softest white pine when put in, and in all but gravelly soil the mounds that were originally erected had by natural causes become level with the surface. I was not able to find in the entire county three stakes in place. Where the rock or gravel mounds were constructed I was usually able to find the mounds. These gravel or rock mounds were erected wherever the soil was gravelly. There were very few of them, only at the base of mountains. About one-eighth or one-tenth of the whole were gravelly mounds. The whole of Provo Valley was surveyed, being not more than twenty-five townships, and my observation was confined to these twenty-five townships. That is all there was in the county.

I am somewhat familiar with the requirements of the government surveys under the law. The monuments and stakes I found were not in accordance with the law at the time I found them. In only one instance was this the case, although I believe in most instances the stakes had been put down and the mounds erected. The soil of the arid land is impregnated with alkali, and the winter snows tend to make the land boggy, so that the stakes sink right down and disappear. I think rock monuments would be infinitely better. Rocks would not dissolve and rot as the gravel and stakes did. Alkali has the tendency to make them do so. I think the present system of rock monuments is the best. These rock monuments are now being planted regularly by the deputy surveyors. My present knowledge is somewhat limited, but there have been some resurveys made, and I have observed that the monuments have been planted in compliance with the law.

I do not concur in the general opinion that the original survey was a very bad one. It wasn't correct, it wasn't on the true meridian, nor did they use the true length of chain, but considering the circumstances I think it was a very fair survey. I am satisfied that the surveyors did not comply with the rules in correcting their chain at prescribed periods. And in not using the solar instrument they didn't get the true meridian to about 40 minutes. Utah County is not on the true meridian to about 40 minutes. The chain was too long. It not being on the true meridian at first, it was very difficult to replace it.

I think a correct survey can be made by using the solar instrument. Precise accuracy is not, of course, possible, but reasonable accuracy can be attained. The survey can be made within much less than the legal closing links. The legal closing links are, I think, 75 links to the mile. That is my recollection. The original survey was

in some cases scarcely within these limits. It can be done closer than that. I think generally that the rectangular system of surveying is not adapted to the surveys now to be made in this Territory, and in fact throughout the Rocky Mountains. All the valleys are mostly surveyed and the remaining unsurveyed land is now mostly in cañons or very small valleys. A rectangular survey through the cañons, chaining the exteriors of townships, is impracticable and very expensive, and must necessarily be incorrect. It is impracticable to carry such surveys through these mountains or valleys. I would triangulate them. There is much of this land that seems to be useless. It would seem to me that the system of authorizing irregular surveys would be well—that is, not on true lines—and possibly as to the quantity to be surveyed; the survey to be made at the expense of the parties desiring the land, and the paying of the expenses entitle the person to entry, and to be the only prerequisite to owning unsurveyed land. In compliance with other provisions of such a statute, if the survey was authorized to be irregular, it might meet the object both for mineral and also for those small irregular tracts of land for agricultural purposes in the cañons and other places.

I would take the liberty to suggest that a change in the land laws in relation to timber seems to be almost a necessity. Merely as a citizen I believe the government is under moral obligations, and possibly a legal one, to allow the citizens who have settled upon these lands in good faith to cut timber from the lands of the government for fencing and domestic purposes. There should be a law that would entitle them to do this. During the time that they are acquiring their title, there should be some method whereby those who have settled upon this land should have an opportunity to get their timber for domestic purposes in some manner. I do not mean for purposes of commerce. Possibly this timber land might be surveyed and communities permitted to enter a portion of the land on which the scraggy timber grows suitable for fencing and fuel. Perhaps it would be as well to permit the local legislature to enter this timber land in trust for and in behalf of the community, the legislature determining the method of disposing of the trust. If farmers were permitted to enter timber land for domestic purposes, that would tend to the benefit of the community. It would permit citizens to obtain timber without violating the law.

Question. Why limit your right of entry to communities?—Answer. I would not limit it to communities.

Q. Why provide for a community entry at all?—A. I would object to the timber lands being open to general entry, because it might create a monopoly. I would suggest this, too: That each and every owner of a mine should be permitted to enter so much timber land. Every person who has acquired title to a portion of government land for agricultural purposes ought to be permitted to enter a portion of timber land; and in each town and village some person should be permitted to enter in proportion to its inhabitants and in trust for them a certain amount of timber land, that they might get fuel and timber for fencing purposes for the use of the town.

Q. Why should that community be allowed to take the timber land?—A. It is impossible for a community to exist on land entirely barren of timber. My objection to private entry is that it would be embarrassing for the government. The difficulty is, that the amount of timber in this territory is very limited, and the lands as held by our people are held in very small quantities. If there was sufficient timber it might be well to open it to private entry, but I do not think there is enough timber to give every man in the Territory of Utah within 100 miles of the settlement 10 acres of timber; that is, every man that is the head of a family, and every man over the age of 21. My idea is, that as people live in communities and hold small tracts, say 5 or 10 acres, they should have a small amount of timber corresponding to their small tract of land, and the whole community will not want more than 160 acres. If agriculturists and miners were permitted to purchase at all, there would not be sufficient for them all, and it would be necessary in a few years to plant timber in the valleys. I am perfectly willing that it should be given to each individual citizen, and I should prefer this, if it can be done.

Q. What is the head of a family here?—A. The head of the family is the man; the different wives are not the heads of the family. It is possible that there are widows who are heads of families, and there are polygamous wives who are heads of families, but there are very few of them.

Q. What are the number of heads of families in the Territory?—A. I would estimate the number of heads of families at 15,000 or 20,000 in this Territory. In the community system of entries it would result in distributing the timber land among the population, even if a certain amount was given to each wife as the head of a family.

Q. Why would it not be a more satisfactory way to simply sell the timber land to whatever individuals wanted to buy it?—A. I think that in consequence of the fact that the timber is so limited in the vicinity of the improved lands of the Territory, it would create a great monopoly that would be detrimental to the actual settlers, who might not get any of it; the settlers would then be at the mercy of the land grabbers. I think a man should be permitted to take the timber land in proportion to

the amount of agricultural land or mineral land he had, and the size of his family. My position is this, that if the government has sold me 160 acres of agricultural land I should be permitted to have a proportion of timber land with my 160 acres of agricultural land if I have acquired a lot in the city or town, and should be permitted to acquire timber in proportion to the area of the town property as a basis.

Q. Would it not create a monopoly by giving a man a tract of timber land for each of fifteen mines if he had so many?—A. I readily admit that the system I suggested may be abused and may tend in a degree to create a monopoly, but I think it is the least of the two evils. My suggestion is to distribute it to the actual settlers in proportion to the area of land they have; I think they ought to be entitled to a portion of the timber land to be entered in trust for them. All I want is to have the persons who are now on the land to have the timber for their wants only.

Q. What is your idea of the price for this timber land?—A. I have no opinion upon that question; if it was real timber land the price should be higher than agricultural land. There are large areas of land that possibly might not be called timber land that parties would be pleased to get title to where the scrubby cedars grow; it is valuable for mining purposes and for domestic uses, but no person could afford to pay much more than the price of agricultural land for it. The great difficulty is that you can seldom find a large body of timber together; it is in groves in the ravines, with large intervening spaces of bare barren rocks, with nothing whatever growing upon it, so that the majority of the timber land in Utah will not be worth more than agricultural land. Besides juniper, there is some pines (mountain pines), cottonwood, quaking aspens, and box-elder. We have no hard wood; one would hardly be worth more than another. I think a uniform price would be just; the price of agricultural land would be a good price for this timber land, for the land is worth nothing after the timber is cleared off. This timber sells generally at an average of \$6 per cord. Much of this timber is brought a long distance; I have hauled timber ten miles. Where the timber grows you can get on an average \$10 per acre.

Q. Do you know anything about the average cost of delivering it at market?—A. It will cost all it sells for. A person will only get the cost of his labor and hire of his team. If he had to hire his team to haul it with he would not make a cent. I know of no person in the Territory who makes it a regular business. Farmers engage in it at odd times.

Q. Is not in your opinion the destruction of the forests attributable more to fire than it is to the depredations of individuals?—A. Yes, sir. There has been more timber destroyed in my county by fires in the past month than the inhabitants would take out in a series of years; say four or five years.

Q. How are these fires started?—A. The fires generally originate through the carelessness of the persons hauling timber, through the lighting of camp-fires, or by hunters and Indians for the purpose of driving the game.

Q. Do you know of any legislation that could be enacted by which the starting of these fires could be prevented?—A. I do not. Ownership of a tract would to a very considerable extent. The creation of an interest would tend to its preservation.

Q. Could this subject of the destruction of timber be better taken care of if it was under the jurisdiction of the district land office?—A. Yes; I think it could.

Q. Can you state in a general way what the exact law is relating to water rights?—A. Practically there is none. It is usage; and the difficulty is, usage is not uniform; hence it does not become a custom. There are some general features that are common. The act of Congress providing that the prior claimants are entitled to the water is very generally recognized.

Q. What is your system of irrigating here?—A. The system of irrigating on a large scale is this: a number of persons will agree together that a certain tract of land is susceptible of irrigation from a certain stream; they will get an engineer to locate a canal from the main stream to this tract of land on the most feasible route; they will then come together, and under some mutual agreement construct a canal, and they will distribute the water under any arrangement that they may make, in proportion to the amount of labor that each man has done upon the canal, and will cultivate their land in proportion to the amount of water to which they are entitled. In a number of cases they are incorporated. In some cases the distribution of water is conducted by water-masters. In every case it is managed by committees elected by those men who build the canal. There is some man under their control who virtually distributes the water, and who determines the amount he shall distribute to each person. The whole matter is too much by common consent and not enough by rule. I have two cases that I have got to try next week, wherein I design to make it a point in the district court that a personal distribution of water by water-masters, even though he may under the statute be an officer, is not such a distribution as can be enforced. I do not know whether I will succeed in making that point or not.

There is another method of monopolizing the water, and that is by the municipal authorities. All the larger towns in the Territory are incorporated into cities by an act of the legislature, usually embracing very large areas often covering large tracts

of country. In these cases the city councils pass their ordinances creating the office of water-master, and these water-masters are usually appointed by the city council, and distributes the water to each and every farmer. In most all cases the ditches themselves have been constructed by the labor of individuals, by the labor of farmers, or by the labor of owners of town-lots, and the cities manage it. I think half the evils likely to grow out of it will be remedied by the action of the courts. I have a case now pending for a neighbor; I am attorney for him and he is suing for distribution of water. The difficulty is we do not know where we stand. I have myself expended \$1,750 on one canal, and I think I own that canal, but I apprehend in a very short time that the city corporation will have litigation about it unless they allow me my \$1,750 part of it.

Q. Who owns these ditches?—A. The city council claims jurisdiction, but I think it is my property.

Q. Where there is no municipal authority and no use of ditches how do people irrigate their land?—A. We have a statute which provides for such cases. It permits them to organize into irrigation districts. We have also a general incorporation law and some of them organize under the statutes which provide for the irrigation districts, and some incorporate under the general incorporation law.

Q. Suppose that two came out here alone; you go above on the river and I down below; is there any provision or custom or law regulating our use of that water?—A. There are two rules that the people are governed by. The law of priority as recorded by their own locations, and their customs which they themselves have adopted; and then to a great extent by the decisions of the supreme court of California. There have never been any decision of our supreme court. We only have the decision of our district court. We scarcely have any Territorial court law. We also follow the Supreme Court of the United States which reverses the common law. The California supreme court reversed it. The water law of the Pacific slope is court law to some extent regulated by act of Congress. The first man could take what he wanted and leave the rest. If he wanted he could take it all to the exclusion of the man below provided he used it in any useful way. That is, in mining, irrigation, and as a power for turning machinery with the intention of returning it to the stream. If the man below was the first man he could stop the man above from cutting off his supply. I do not know whether our Territorial legislature at its next session will pass an irrigation law or not. I believe they would if they could only be of the opinion that they could have time enough. The main point I wish to suggest on irrigation, or rather the reason why I noticed the subject, was this, that the land laws at the present time, both pre-emption and homestead, require residence.

Now if all our lands that are worth anything at all require to be irrigated, the expense of procuring water and making ditches is far greater than the expense of living upon the land. If an expenditure of, say, from \$2 to \$5 per acre for irrigation could be taken as settlement and parties were then permitted to "prove up" under it, it would be of great advantage. I have expended more for irrigation than would fence the land with good fences.

---

*Testimony of E. S. Foote, ranchman, Salt Lake City, Utah.*

E. S. FOOTE testified at Salt Lake City, September 11, 1879, as follows:

I am a ranchman in Richmond County, 18 miles from Evanston, Wyoming. I have been connected with cattle-raising for the last four or five years. We are very much at a loss to know what to do in the future on account of getting the title to our ranches. Under the present law we cannot enter enough land to make our ranch, and others can come in and cut us out. I am located on a small stream called Salerans Creek.

It is necessary to have about 10 or 15 acres for each beef in order to keep them in good order, and for sheep I should say five would equal one beef in that altitude, which is about 6,700 feet high. Agriculture is not possible there. It is not an agricultural district; it is too frosty. In order to make a success of stock-raising we have to cut hay for winter. To do that we have got to irrigate, and we cannot safely go to that expense unless we have some title to our lands better than we have now. Each year the grass deteriorates as the lands are pastured, especially if they are overstocked. It takes a greater acreage to keep a given quantity of stock. That is more especially so regarding sheep; it is caused mostly by overstocking. These wild grasses, if they are constantly cropped short and not allowed to go to seed, will run out very soon. I have lived in the Territory about 15 years, and that is my observation. I live southwest of here, and my county is becoming almost devoid of vegetation because the grasses have been eaten so closely. This could be avoided if we were allowed to own the land, and would increase the quantity and quality of both. It would furthermore allow settlers to make improvements and introduce tame grasses, and improve their stock by

using fine bulls. Now it is but little of an object to undertake to improve stock because the neighbors get the benefit of the improvements one makes; but if we had some sort of ownership to the land, so as to fence it and be able to keep other people off, we could then care for that land. I would suggest that the land be sold in sufficient bodies at a nominal price; reduce it to the lowest price it has been in the market and subject it to a gradation act, say at 10 cents an acre.

I would place some limitation on the amount of land each person might get (say 1,000 acres to each man) to prevent whole counties being taken up by one individual. I would rather that the land should be sold in lots to a man who has herds in proportion to the number of his cattle. My idea is, that otherwise a man of moderate means would be crowded out of the country entirely, and I should make the number of cattle a man owned the unit of his acreage. I think a system that would allow the pasture homestead of a sufficient size to support a family, and in addition to allow a man to purchase to the extent of the cattle he has, would be a very good plan.

The statute of this country allows three or more individuals to form an irrigation company and control the waters and distribute them; and the company then have the absolute use of those waters afterward, to the exclusion of any one else. Under that system the streams are all taken up without any ownership to the land other than the possessory title, so that in fact, under the existing statute, three or four people may take up and control all the water back of it, the limitation being that they must use the water, the evidence of use being affidavits. There is no limitation upon the right of a man to use the water so that it is possible for him to exhaust the whole of it to the exclusion of other parties.

I have both cattle and sheep, and I find the sheep drive the cattle off. They pasture the grasses so short that the cattle cannot graze, and then, too, they do not like the smell of the sheep. We keep them separated by herders. I lived in Tooele County, Utah, for some years. I think about 10,000 acres would support one beef in that country now. I have known, in the past, when it would support one beef to every 10 or 12 acres. It was then as good as my present range, and that result has been brought about by feeding it out. I was out in that quarter some months ago and I did not see any grass, except a few spears of meadow grass. Where I am now the land has been surveyed by the United States. We are within the railroad limits and have entered a section of desert land of 640 acres. We would buy the land if we could and make improvements.

A law concerning water was passed at the last session of the legislature. We have a sheep and cattle tax in our county, amounting to about 12 mills on the dollar. We cannot buy the railroad lands and I have been leasing them for 25 cents an acre, and sometimes, when a man has been irrigating his meadow all summer, it is lost to him in the winter by being taken by some other man, simply because the first one cannot own or control it. I would readily move away from these railroad lands to some other locality if it were possible to buy land.

The average size of cattle herds in our range is from 2,000 to 5,000, and our sheep herds are from 3,000 to 15,000. There are constant conflicts between sheep and cattle men, and I think this question of disposing of the lands should be settled. Some cities have ordinances preventing sheep coming within a certain distance of them. If I was located with a herd of cattle a man might come in there with a band of sheep and drive me away from my home. A man holding the water right here and controlling all the land should be allowed to buy it, and ought to be made to.

---

*Testimony of Samuel Gilson, horse and cattle raiser, Salt Lake City, Utah.*

**SAMUEL GILSON.**

Is engaged in raising horses and cattle, and has a ranch in Castle Valley, in Central Utah. He states that the pastoral interests of Utah labor under great difficulties from the fact that no person who pastures cattle upon a range can be secure in his occupancy. Any other owner of cattle may at any time bring a herd to pasture upon the same range, and overstock it so that the grass is rapidly eaten and then both herds are obliged to emigrate to other localities. This is not only common in Utah, but is an universal rule. Very few herds can occupy any range for a long period, because as soon as it is known that good grass is found there herds from other ranges which have been eaten out are driven upon it, crowding it beyond its capacity. The newly arrived herds have themselves been driven away by the same causes from their previous ranges, or perhaps have been displaced by sheep herds, which will quickly drive off cattle from any range. There is no local law or custom by which a cattle ranchman can be protected in his occupancy, and he believes that some way ought to be provided by which such occupancy can be secured. Under the present state of affairs

there is no permanency of residence, and no identification of any pastoral interests with the soil; nor is there any encouragement to make permanent improvements, nor any improvements beyond those which are absolutely necessary for the most temporary purposes.

If some way could be provided by which ownership of a range or a tenure could be secured by law to the occupant it would in Utah be of great benefit to the cattle interest. There are ranges which are utterly unfit for ordinary agricultural purposes and suited only for stock-raising. If a person could locate in one of these places, and be secure in his holding, he could raise grass very cheaply by irrigation, and sustain his herd through the winter on a comparatively small tract of land. I mean small when compared with the wide areas over which they must now range in order to get enough grass to sustain life. There is a general conviction among cattle-growers of Utah that the industry must come to the raising of tame grasses for the winter feeding of cattle, or else the whole industry will die out altogether. The wild grasses—the bunch-grass once so abundant everywhere—are soon killed off by protracted feeding, and do not grow again unless after long years, when in the slow course of nature they come up again from seed. Most of this wild grass has been destroyed already, and ranges which once were thick and deep with it are now utterly barren of it, and if left to nature many years, perhaps generations, must pass before it would be restored. Tame grasses would not be killed so readily, for they form a turf, and would yield hay in large quantities by irrigation.

The Frémont or Dirty Devil River will never be used for irrigation successfully. It runs through Rabbit Valley, where a very large area can be devoted to the raising of grass, and is fit for nothing else. When the river leaves that valley it flows through a country where agriculture is impossible under any circumstances, and finally reaches the Colorado through deep, narrow cañons. If a stock grower could take up a suitable tract in that valley and be protected in his ownership he could raise a large herd on a comparatively small tract. Most of the good ranges, except in the high plateaus, have been eaten out, and are now nothing but barren desert, and these have once been covered with a rank growth of wild grass. Through the gradual extinction of the grass the pasturage has grown poorer and poorer, and in a very few years the amount of stock raised in this Territory will be merely nominal, unless some way can be provided by which human industry can supply the defect. All stock growers would agree with me, I think, that cattle-raising could be prosecuted profitably by raising tame grass by irrigation. But in order to do this it will be necessary to provide the means of allowing settlers to take up large tracts—I mean more than 160 acres, and probably as much as ten times that amount—and give them exclusive possession of it.

In answer to the inquiry whether the use of water for irrigating grass would not take away just so much water from streams which are used for irrigating grain crops, I say no. The tame grasses ripen here in June or July, and would not require any irrigation after May or the early part of June. At that time the streams are at flood, and carry a very large excess of water. The grain crops require their principal irrigation in the latter part of July and August, when the streams have fallen off to less than half their volume at flood-time. The irrigating capacity of a stream for grain crops is the quantity of water it carries in the latter part of July and in August. The irrigating capacity for grass would be the quantity which it would carry in May and June. In those months the streams could spare for a grass crop two or three times as much water as would be called for by the largest possible grain crops, without the slightest injury to agriculture.

The methods of managing herds of cattle in Utah are widely different from those employed in Colorado. We usually take, whenever we can, a winter and a summer range. The winter ranges are in the valleys and lower levels generally. The summer ranges are high up in the mountains or high plateaus. The snowfall is always light in the valleys of the desert portions of Utah, and quickly melts. We have no storms of extremely cold wind, before which cattle must drift in order to keep from freezing, and in the severest winter winds they easily find shelter behind cliffs or in gulches or in cedar groves. They are never driven off the range by storms and very rarely perish on account of the weather, unless they are starved and gaunt. There is no general "round-up," but we keep the cattle from straying very far, and send out for them at all times; in other words, keep them rounded up at all times. We corral them in the spring or early summer for branding, and brand at various times through the summer, whenever convenient. The summer ranges in the higher levels are abandoned by the cattle when the snows come, and the cattle always come down in long trains, without being driven, and enter the valleys when the snow gets deep above. There they are easily caught and herded.

I think the wants of the stock industry would be met if the lands suitable for pasturage could be obtained from the government, either by pre-emption or by purchase, in tracts large enough to support a moderate herd. I think it would be unwise and even wrong to allow a few men to obtain land monopolies from the government. A policy which fixed no limit to the amount of land which an individual could acquire

would be very repugnant to the people with whom I am acquainted. But a reasonable tract, sufficient for the support of a moderate herd, or even of a small one, should, in my opinion, be placed within the reach of any man who chooses to acquire one. I think it would be better for him to buy it rather than to acquire it for nothing. Under the homestead law there is apt to be much perjury and dishonest acquisition of land, and I think the pre-emption of such tracts would be preferable.

*Testimony of James H. Martineau, deputy United States mineral surveyor, Cache County, Utah.*

The questions to which the following answers are given will be found on sheet facing page 1.

*The honorable Public Land Commission :*

GENTLEMEN: In reply to the questions in the circular forwarded to me, I have the honor to make the following report, numbering each answer to correspond with that of each interrogatory.

For more than thirty years I have been a resident of this mountain region, in Utah, Nevada, Wyoming, and Idaho, and have personal knowledge upon many of the subjects referred to; but in regard to some of them I have not, and such will leave unanswered. The past thirty years have been spent in surveying, civil engineering, exploring, and Indian warfare, which experiences have given me a very complete knowledge of the physical character of the country. In the hope that my communication may be of some use to the Commission, I remain,

Very respectfully,

JAMES H. MARTINEAU,  
Deputy United States Mineral Surveyor.

ANSWERS.

1. James Henry Martineau; Logan, Cache County, Utah; surveyor, civil engineer, and deputy United States mineral surveyor.
2. In Cache County nineteen years; in the Territories about thirty years.
3. I have not, except to locate in Wisconsin a land warrant received from the United States for service in the Mexican war.
4. Have seen the settlement of these Territories, and know the experience of very many acquaintances.
5. From one to seven years in pre-emptions; in homesteads, after the five years expires, from one to three years. This applies to *uncontested* cases; contested cases are longer.
6. Have noted some. There are lands very desirable to enter upon which settlers cannot reside as prescribed by law, being compelled thereby to make false statements to the land officers; such, for instance, as low, wet, swampy lands, upon which no one can live, but desirable and necessary for hay and pasturage. Also lands unsafe on account of Indians and possible danger to life. To remedy this I suggest, in case of wet lands, that parties may "prove up" their claim by making proof satisfactory to the local land officers, in connection with the "field-notes" of the United States surveys of the character of the tract in question, that said land is unfit for residence. In case of lands unsafe on account of Indians, proof from the county court or from other reliable authority should be presented as to the facts in the case; the time so unavoidably spent away from the homestead to be credited to the applicant. When possible, settlers should reside on the land claimed.
7. The public lands still unsettled are agricultural, pastoral, mineral, and timbered.
8. 1st. By the field-notes of the land already surveyed. 2d. Lands unsurveyed. Lands adapted to agriculture to be surveyed under the present system. Mountains and broken, hilly land not adapted to cultivation should be ascertained as such by running standard parallels and meridians at certain distances apart; from said standards and meridians township lines to be run in cases where an inspection of the country would indicate land suitable for subdivision. Mountains or broken land not worthy of subdivision to be surveyed by triangulation. Mineral and valuable timber land to be located and subdivided according to the conformation of the country by cañons, ridges, and basins.
9. Having ascertained by standard parallels and meridians, and sometimes by lines running on township boundaries, the character of the tract in question, I would survey agricultural land suitable for settlement by the present system; timber land and pastoral to be parceled according to natural conformation by cañons, ridges, &c. In

this region timber always grows, if any at all, on the northern or shady slopes of ridges and mountains; never, scarcely, on the sunny or southern slopes. Roads are only possible along bottoms of cañons, winding in every direction; and to obtain the timber it must be slid down the rough, steep, rocky mountain paths with infinite toil. If these precipitous and deeply-seamed mountain sides were subdivided into sections as other land, the greater part would not be worth entry, because there would be no way to get to them without crossing some one else's claim. I would suggest that the long, narrow strips of timber along the side of the cañon could be subdivided for sale best by running straight lines from the bottom of the cañon to the top of the ridge, dividing it into strips of from 40 to 160 acres. For platting and numbering a line should be surveyed in the bottom of the cañon, connected with some United States survey corner or monument. Pastoral lands on the sunny side of mountain ridges may be laid out in a similar manner; in other places, according to the natural basins and drainage of the country. Mineral lands to be surveyed substantially as at present, providing that United States mineral monuments may be properly connected by triangulation with United States surveys or noted objects. The present system of disposing of public land is good, so far as relates to land capable of producing crops without irrigation; but for lands that *cannot* be cultivated without irrigation, justice to the hardy pioneer should give him the land he redeems from desert sterility, the settler merely paying the expense of survey and fees for making the necessary entries in the land office. If this be deemed inexpedient, let the prices of public lands be graded. Lands suitable only for stock range not to exceed 25 cents per acre; arable land needing irrigation not exceeding 50 cents per acre; timber land to be graded according to kind and amount of timber at from 25 cents to \$2 50 per acre.

#### AGRICULTURE.

1. Climate is mild in Utah and Nevada; rainfall light. Season for growing crops about as in New York State. Snow rarely more than 6 or 8 inches deep in the valleys; in the mountains 2 to 25 feet deep. Water for irrigation comes from small mountain streams fed by snows of winter.

2. The rainfall is usually from October to April, with a few light showers during the rest of the year. Scarcely any rain falls in irrigation season, which is from May to September. We depend entirely upon irrigation.

3. Not more than 1 per cent. of the arable land.

4. Of the whole Territory, I think about 15 per cent. by natural streams; by artesian wells, about 5 per cent. additional.

5. Wheat, oats, barley, rye, corn, lucerne, clover, grass, potatoes, and all varieties of root crops growing in the Northern and Middle States.

6. Difficult to say. Some land—loamy—will do with two irrigations; a loose, gravelly subsoil necessitates as many as ten.

7. Small mountain streams and brooks. In some cases the waters of the larger rivers, as Bear, Weber, Logan, and Sevier.

8. I have an extensive practical knowledge of irrigation, but cannot say much in this report. Grain *must* have water when the kernel is in the dough, or it will shrivel in ripening. Potatoes *must* have water when in blossom, and when the tubers begin to form. So with other crops. Irrigation greatly increases the fertility of the soil, especially when the water is muddy; or even if clear, when not applied too long at a time in one place. Crops have been grown at an altitude of 7,000 feet, and some kinds will probably mature still higher.

9. Ninety-five per cent. in some localities. When water is scarce, it is all used. The water returned to ditches is only that which escapes control. Waste of water is rigidly guarded against. A man is entitled to water in proportion to the number of acres to be watered—in many localities, from one to two hours to the acre in daytime; double that during the night. The main canals and their numerous branches are each placed in charge of a water-master, who gives the stream to each in his turn; and who also has charge of repairs, &c.

10. In the settled portions it is all taken up. The local customs and laws are as follows: Settlers in a new place take as much water as they need in a canal. If there be water still unclaimed in the stream other parties may take it. No one can water to the detriment of first parties claiming and using it. Water rights are bought and sold as other property. Selling land is also a sale of the water right of said land unless expressly stipulated to the contrary.

11. But two have come before the United States district courts. They were the cases of men who endeavored to take the water from previous owners by new canals; but the decision of the court was against them, confirming the rights of previous owners.

12. Twenty-five per cent.

13. It is. Two to three thousand acres.

14. They should only be sold to actual settlers.

15. Six acres. This is about the average for pasturage.

16. One hundred is the least number on good range; four times as many on the usual quality of grazing.

17. Do not know.

18. Diminished rapidly.

19. No; cattle cannot be confined by fences on the range. It would greatly. Men raising improved stock would not then be troubled by inferior stock getting into their herds.

20. Springs and mountain streams.

22. Five.

23. Diminished. Sheep kill out the grass in three or four years.

24. No. Cattle and horses will not graze after sheep unless compelled.

25. None that I know of.

26. Do not know. Sheep are from 1,000 to 8,000 in a herd; cattle, 1,500 to 5,000.

27. Run standards and meridians a few miles apart to learn the physical nature of the country from which subsidiary lines, township or otherwise, may be run to such portions as need subdivision or parceling. Sell first-class agricultural land at \$1.25 per acre to actual settlers; lands requiring irrigation at not more than 50 cents per acre; pastoral lands, 2,500 acres to each settler at 25 cents per acre; timber lands to be classified and sold at from 50 cents to \$2.50 per acre to actual residents.

28. There is. The first United States surveys made over twenty years ago, especially under Mr. Burr, were mostly made upon *paper* only. Of the corners actually set many were destroyed by prairie fires long before settlement; many by jealous Indians and some by thoughtless whites, herdsmen, and others. It would be a great blessing if the government would authorize a *resurvey* in some localities, even if it should be at the expense of the county or Territory interested.

#### TIMBER.

1. It is scarce; red pine on the lower ridges; white pine and aspen (the latter worthless) on the higher; very difficult of access, and requiring from two to four days for a man to make one round trip.

2. Very little planted, there being no ground or water for it. The pine will not grow in low altitudes.

3. By sale, parceling the timber land in strips running from the bottom of the cañon to the top of the timber-covered side of the mountains, usually from 40 to 100 chains. The base line in the bottom of the cañon to be carefully run, connecting with some point of the regular United States survey. These strips to be from twenty to forty chains wide.

I prefer *sale* of timber, because it is the only effectual way to preserve it. A man will naturally look after his own property, but be wasteful when it is not. If timber land be leased an army of inspectors will be necessary, or a failure to preserve the timber will result. Men leasing timber should be required to keep up the growth of timber by planting small trees, and protecting small timber naturally growing thereon. But few men could be found who would carefully supervise this, and without such constant supervision the scheme would be a failure. But men *owning* the timber, and knowing they could never make another entry, would preserve it.

The local land offices could best see to these matters, being nearest the ground and familiar with the country, people, circumstances, and necessities of the case. They could appoint overseers for each county, and cause all land parceled out to be returned to the surveyor-general's office as other surveys. Railroads should be prohibited from purchase. They, more than all other causes combined, destroy timber, using generally small timber suitable for single ties, while settlers cut the full-grown trees.

4. Yes.

5. There is. The same kind of timber springs up from seeds, but is of slow growth.

6. Forest fires are generally accidental, originating sometimes by lightning, often by smoldering embers of deserted camp-fires, scattered by gusts of wind among surrounding leaves and twigs. Hundreds of square miles of timber have been burned this year in Utah alone. In Utah a Territorial law imposes a fine of \$1,000 for setting fire on the public domain, but it is almost impossible to ascertain the perpetrator of the act. If men *owned* the timber land it would be watched by persons directly interested. The settlers *must* have timber for building, mining, and manufacturing purposes. The country cannot be inhabited without. To absolutely prevent timber from being used would cause a region of wonderful mineral and agricultural wealth to revert to desolation. Men can no more be prevented from using the timber than from drinking the water of the mountain stream.

8. Local custom requires men who cut timber to remove it in a reasonable time, or any other person may take it.

9. Yes. They know better than any one else can the conditions, requirements, and circumstances pertaining to their respective districts of country, and from personal acquaintance of their deputies and others most liable to understand.

## LODE CLAIMS.

1. Some experience in surveying claims; none as an attorney.
2. A great defect, I think, is allowing one claim to overlap another when surveyed for patent. There are many cases of from three to seven conflicts in regard to superficial area of ground, and litigation, expensive and vexatious, renders many *good* mines practically worthless.
3. It is very unjust to the original and rightful owners of the claim and very injurious to the prosperity of the country at large. Out of many cases, instance the "Shoo Fly" in the Ophir Mining District, Tooele County, Utah, which overlaps four other and previous claims; and some of the four also overlap each other. The "Mono" overlaps the "Shoo Fly," and the "Utah Queen" both the former. Also, in the same case, the "I X L" overlaps the "Grecian Bend," which covers part of the "Mono," which also overlaps the "Shoo Fly." I should infer, if government intends to protect and give title to the original locator, it should only allow a claimant for a particular location upon conclusive evidence that such location was actually the first; afterwards no party should be allowed to claim ground previously filed on in the United States land offices.
4. The outcrop of a vein or lode. I think not. Slides of earth or rock frequently occur, covering what was formerly the outcrop of a vein or lode.
5. Not always.
6. Frequently.
7. Not personally; have often heard of such difficulties.
8. Cannot say positively.
9. I think not.
10. They may, but not in my personal experience.
11. To their disadvantage. Parties make such claims sometimes for the purpose of contest and to force other parties to buy them off by compromise.
12. Have no experience of such a case.
13. I think so.
14. Possibly.
15. Yes. In Logan, Cache County, by about twenty parties, some miners, others citizens, but all interested in claims. A recorder was elected, with power to appoint a deputy. His duty was to make record of locations, make and record minutes of mining-district meetings, together with the mining-district laws (all such records being open to inspection by interested parties during business hours). The main object is to keep a true record of claims, showing direction, length, and width claimed, time of location, &c. The discoverer posts a notice on the ground, giving names of locators, general direction of claim, and number of feet claimed, and width. They claim the vein or lode, with all its angles, dips, branches, and variations, the specified number of feet as to length, and, between end lines, to follow the vein downward wherever it goes, to the center of the earth. The effect of such a notice, recorded within the specified time, is to give them absolute possession.
16. They have not, I think.
17. I think not in many cases. Prospectors open claims in places many days' journey from United States land offices, and often, if they were compelled to make such a journey, their claims would be taken by rascals while they were gone. A local mining district obviates this danger.
18. I think it should.
19. Am incompetent to suggest anything in so important a matter.
20. I think so. Five years.

## PLACER CLAIMS.

1. About one-half. The minerals are specular, bog, and hematite iron, silver, copper, lead, antimony, coal, and black, white, and variegated marble. Also sulphur, copperas, alum, manganese, tellurium, cinnabar, and mineral wax (so-called).
2. Never acted as attorney in such matters, and am not prepared to answer.
3. Same answer as No. 2.
4. 5, and 6. Same answer.
7. Have never heard of such a thing being done.
8. Not to my knowledge.
9. I do not.

Respectfully submitted,

JAMES H. MARTINEAU,  
*United States Mineral Surveyor.*

NOTE.—I have been absent for several weeks in Idaho, which will explain why I have not answered the circular sooner.

Respectfully,

J. H. MARTINEAU.

LOGAN, November 1, 1879.

*Testimony of H. P. Mason, engaged in the timber and lumber business, Salt Lake City, Utah.*

H. P. MASON, who is engaged in the timber and lumber business, testified at Salt Lake City, September 15, 1879, as follows:

We purchase lumber cut here in Utah on the government lands. I think that the timber lands should be protected in some way. The timbermen are willing to satisfy the government. As I understand the law the timber can be confiscated if it is cut from government land. I have had some talk with the lumbermen, and they appear to think that they should be permitted to buy the land or pay stumpage on it. If they can satisfy the government in any way they would be willing to do so. They don't wish to be annoyed in their business. I think the whole subject might be better managed if placed under the control of the district land office. I think the land ought to be sold. There is not one mill here that can control much forest. They cannot go more than two or three miles; it does not pay. The timber is high on the mountains, and is hard to get at. But it would be necessary to sell the lands very cheaply, because the men have to buy so much land to get the necessary amount of timber. I think it should be sold in unlimited quantities for that reason. A large amount of timber is destroyed here by fires, and all the timber will go in a few years if it is not protected. I think it is better to give the inhabitants a chance than to let fire destroy it. The people are bound to get it, and if there is no law permitting them they will take the chances on it. The demand is great, and they will have it and supply it in any case. There is very little timber here. The best timber comes from the East and poor timber from the West. There is not enough to supply the local demands, but I think that what is here should be protected. I think it would be better for the government to get something for it than to have it destroyed by fire. Ownership would tend to protect it. The people do not feel safe in doing anything because of the unsettled condition of affairs. I suppose there are 500 men in the timber business in the Territory of Utah, and they are only getting a living at it. They are willing to obey the law if the government makes it possible for them to do so.

---

*Testimony of William R. May, cattle raiser, Nephi, Utah.*

MR. WILLIAM R. MAY, of Nephi, Juab County, Utah:

Has resided here since 1860; is engaged in raising cattle and to some extent in farming; has been assessor and collector, and also has practiced law; is a member of the Mormon Church.

On the subject of occupying and irrigating land he states that the Mormon people have been in the habit of proceeding in detachments consisting of a number of families, sometimes as great as thirty or forty, but usually less, to some stream which could be used for watering farms. They at once divided up the land in their own way, being governed by the capacity of the stream and any local considerations incident to the place. The land was subdivided into tracts of from 10 to 20 acres, necessarily contiguous, and in as compact a body as possible, partly for convenience in irrigation, partly for defense against Indians. The first labor was given to building a defensive work against attack and in providing shelter that is—houses of preliminary and very primitive construction. The next work was the irrigating ditch, or, indeed, the ditch progressed often from the start along with defensive operations. It was dug by the co-operation of all the colony, each man being expected and required to give to its construction an amount of work proportional to the acreage of his land. There was no act of incorporation of ownership in the ditch at first, it being regarded as the common property of the community.

The titles to land were acquired in the following manner: After the original subdivision was made into ten and twenty acre lots, the land was held practically for about ten years, or even fifteen years, under squatter rights. As nobody but Mormons lived here then such tenure was as good as by patent. About ten years ago the laws of pre-emption and homestead were extended over the Territory, and it was considered of importance to then acquire government titles. Some of the land was then taken up by pre-emption, some by homestead. At the same time some of the land was also taken up as township sites, but this method was not extensively followed. To take up a township site it would be necessary to have officials and a civil government organization, and this was thought to be an unnecessary expense and money was exceedingly scarce. All the temporal as well as ecclesiastical affairs of the people were regulated by the church, and the double government was thought superfluous, so the township site locations gradually fell into disuse and homestead and pre-emption were chiefly resorted to.

When the township method was employed the settlements were incorporated as cities under Territorial law, and a regular suite of officers, mayor and aldermen, &c.

were appointed, but none received salaries. The entries of township sites at the land office were made in conformity with law by the mayor of an incorporated city, or by a probate judge of a county in behalf of other settlements, and the payments were made by these officials for their people, and when the patents were received the deeds of the several parcels of land were made by the judge or mayor to the respective occupants. Such farm lands as were required in tracts lying outside the township site were homesteaded or pre-empted by persons in 160-acre tracts, and titles to the subdivisions of these quarter sections were deeded by them to the several occupants.

There is, however, in nearly every settlement a small portion of the land which has been taken up as township site, and this was rendered necessary by the very compact manner in which people were compelled to cluster together for defense against Indians and for irrigating from a common ditch dug without capital. By far the greater portion, however, has been homesteaded or pre-empted.

In the distribution of water rights each man was allotted his share in proportion to his acreage, provided he had done a corresponding amount of work upon the ditch. The capacity of the stream had been carefully estimated, and no more water was assigned to the land than it was believed to be able to irrigate. In the year 1870 it had become manifest that the quantity of water in the streams had notably increased, and more fields were assigned to incoming settlers and a supply of water furnished to them. This was done by common consent, and the water was distributed under the supervision of the town water-masters. The rights of the earlier occupants to water are, however, undoubtedly prior rights under the law, but there has never been occasion to insist upon this priority to the deprivation of later occupants, because the supply, though strictly limited, has in general been sufficient to meet the principal wants. The advice of the church is always followed in the distribution and regulation of water.

---

*Testimony of J. B. Neil, register of the land office at Salt Lake, Utah.*

J. B. NEIL, register of the land office at Salt Lake, Utah, testified as follows:

I think that all the forms in homestead and pre-emption entries could be much simplified. The notice of intention to prove up in homestead and pre-emption cases is altogether unnecessary and is very provocative of contests. In canceling an abandonment of a homestead we take the proof here and send it to Washington. We make a report to the effect that such cancellation proof has been taken, and then wait until the department at Washington sends back to us an order for the cancellation of the land. We cannot cancel the entry until the order comes from Washington. I think that the cancellation of homesteads abandoned should be made at the land office where the proof is taken. It is done upon our recommendation anyhow, and the interests of the public would be subserved if we were permitted to declare the abandonment. It takes six months for the order of relinquishment to come from Washington here. It would be better to do it right in the local office, to the saving of the time consumed in forwarding the case to Washington and getting it back. The rule is now that the person in possession of the land cannot file until the abandonment is declared, and the local land officers are not allowed to communicate to him in advance; and thus it frequently happens by reason of the rule, and because we have no right to notify anyone, that other persons than those equitably entitled to the land rush in and file and get it. I think that the same rule should apply as in contested cases; i. e., we should be allowed to send notices.

I do not see any reason why the inception of mineral titles should not be just the same as in the pre-emption or homesteading of agricultural lands; and the whole system of district recorders should, I think, be abolished, as a man's title to a valuable piece of property now rests upon a recorder's integrity and upon his keeping the records correct; and it is certain that they are frequently kept by incompetent and probably illiterate men and subjected to all the inconveniences of a mining camp, especially in a new district. I think the registers and receivers of the land districts should have exclusive charge of and jurisdiction over the timber, and if the present law was amended to do that, it would be of great advantage to the government and to the people.

I think that under certain limitations a sale of all the lands adapted to pasturage would be advantageous to the stock raisers of the country, but I have not thought of any system of disposing of them; but certainly in any modification of the present law the interests of owners of existing herds of cattle should be protected.

I think the water rights in this district are well taken up. The general estimate of agricultural lands in this State is about 50 per cent. These agricultural lands consist of desert and pasturage lands. I think there is very little irrigable land that has not been taken up; I mean lands available without vast expense in the building of ditches, &c.

Since I have been here, a little over two years, both seasons have been exceedingly dry ones. From what I can learn agriculture does not pay well here, and would only be profitable on a large scale. The resources of Utah are mineral and stock raising. I think the greater part of the land classed as agricultural is really only pasturage land.

I have had no complaint of conflicts between the sheep and cattle men. The people in filing on their land complain to some extent that the stakes are gone, and they hire surveyors to find their corners for them. The stakes are not permanent in the first place, and time destroys them; they rot off or are broken down and destroyed. I think it very advisable and necessary that some permanent form of stake be used. There was one case in this office of complaint where land was marked as mineral when it was agricultural. I know of no way under the present system by which a more correct classification could be made. I think there could and should be an improvement in the classification, but just how it should be done I would not like to undertake to say, for I have not given it sufficient thought. In the interests of this Territory, I think the whole matter ought to be settled promptly. I think there is a great deal of red tape that might be done away with, and that registers and receivers should have more jurisdiction, and that they should have a right to subpoena witnesses and perpetuate testimony. In regard to improvement in administration, I think it is not the fault of a law but of the land office. Now, for instance, in regard to the difficulty of obtaining patents, take the case of a cash entry which involves much delay in the general office. Probably there are a great many deficiencies in the preparation of the case, particulars that are lacking, and the clerk at Washington will go over that case, and he will discover these deficiencies, that something is needed to complete the case. He sits down and writes a letter calling for three or four supplementary proofs, and afterward he finds other deficiencies and writes another letter, and all this causes a delay of not less than six months, where it is not necessary at all. In the homestead and mineral divisions they are more practical. I think in a great many instances that the register and receiver should have final jurisdiction.

The office regulations and the law conflict in the matter of contracting for cancelling the land before the pre-emption is made. This compels men to commit perjury. Inasmuch as the pre-emption law has a homestead feature in it I do not see any harm in repealing the pre-emption act. I am in favor of selling the timber land, not under the present law, but let the purchaser take them where he likes. I do not just know what to put the limit at, but I would sell them at a price not to exceed fifty cents per acre. Destructive timber fires could be stopped in a great measure by selling these lands; self-interest will protect them and self-interest will protect the growing timber. The present law does not protect it in any respect, not even in the collection of stumpage. There are a few timber-culture entries here, about thirty-eight in all. My objection to the present timber-culture law is this, I think there should be no restriction as to the section.

Under the town-site law an incorporated town has the right to take up a certain number of acres according to the population. Then under the act of March 3, 1877, they were allowed additional entries not to exceed 2,560 acres in any case. In this Territory the legislature has incorporated villages and towns so that it is possible, I have been told, and I believe it to be true, that a man could enter the northern part of this Territory and go out of the southern limit without getting outside of incorporated villages, and that permits them under the law to exclude a person who would want to make an entry within the incorporated limits of a village, although the village might not be settled. Any person they do not want in their incorporated towns they can prevent taking up lands in that district. That is the construction given to the law, though I do not think that it was the law. It is vexatious and prejudicial to the interests of the country.

Concerning mineral claims I am hardly in favor of a square location. I think the chief objection to that would be that you would have to take such a large tract in order to protect persons in deep mining that it would prevent prospecting in large areas of ground. I suggest that as an objection to square locations.

I think that registers and receivers should have the right to go away from their office to take proof and evidence whenever the interests of a large body of settlers require it, and I think it would be a good idea to give to registers and receivers the power of inspection officers. I think it would be an excellent thing to devise some simple method of distributing the decisions of the General Land Office upon all land-office matters to the various district offices.

---

*Testimony of James H. Nounan, miner, Salt Lake City, Utah.*

JAMES H. NOUNAN, of Salt Lake City, testified September 15, 1879, as follows:

I have been a miner for some fifteen or sixteen years. I think there ought to be a square location about 1,500 feet by 1,500 feet, for the reason that there is not one man

in a thousand but requires a considerable amount of timber, even if he has a sufficiently large dumping ground, and if they could acquire title steadily to the land it would be far better for the prospector to come into this office and file upon the land, and then be allowed to make final proof within twelve months. I have had some experience in that direction. I have been prospecting extensively and spending large sums—several thousand dollars—upon different claims, and then the trouble was so great to get a patent that rather than expend the money to get a patent I would expend it in working the mine, without ever acquiring title. The result was that I lost nine-tenths of the claims I had, while if I had had a speedy way of acquiring title I would have had my claims secure.

Under the present law it requires \$100 worth of work per annum to acquire a title, and yearly payments all the time until the patent is issued here. The government is without its acreage, and the party himself has no security for his claim. He might be called away without the least fault of his, and some one else jump the claim. There is much needless litigation, too, under the present law. If the prospector were provided with a speedy and simple way of acquiring title to his land, he would always do it. I think the whole routine of acquiring title ought to be done in the district land offices, and that the recorder's office should be abolished.

I was United States timber agent for some years. I have had a great deal of experience in timber matters. I know that there is not only immense bodies of timber destroyed annually by fires, but that nine-tenths of all the timber that is taken from the public land now is taken without stumpage being paid. I would put this matter under the district land office, and I would sell the timber land. I would have it all surveyed and sold, requiring the possession of agricultural land by the party applying as a condition precedent to pre-empting it. I would sell it to actual land owners at the rate of from \$2.50 to \$5 an acre, in proportion to the land actually sold. I would not sell it to everybody. I would cut this timber land up into 10-acre tracts. All the timber land is worth something. A great many of the farmers would just as lief have timber land with a small growth upon it as large timber, because the small timber is more accessible. This small timber is mostly quaking aspen and scrub or small pine. It makes the very best of fuel. The heavy pine is confined to the high mountains, and is hard of access. It is a costly process to get the timber. What you want is to get the timber lands into the hands of the people, because when they own the timber they will protect it. There has been so much timber destroyed by fire I think it is time the government should take some action in the matter.

If a man is allowed to take up this timber land and acquire title to 10, 20, or 40 acres, as the case may be, it identifies him with the timber and he will protect it, and thus he will protect other timber around his. I think also that the owners of mines, mining companies, &c., should be allowed to take timber as they need it, in quantities not to exceed 40 acres; allow them to buy in that much timber land. They would rather buy timber delivered to them, and I can imagine a case (where the necessity is forced upon them) where, to protect themselves, they must have the timber. Of course I would not allow them to take up all the timber, and thus make others suffer. Many of the mines and prospects are worked under lease, and I think those mining them should be permitted to go and cut such timber as is necessary for the development of the mines. As it is now, they will ride right in sight of a fire and will not put it out. Nobody has the care or custody of the public forests. Fishermen, hunters, and prospectors are careless about their camp-fires. Prospectors are more careful than any one else. They know the value of the forests; but hunters and fishermen are very careless. There is nothing to put the fires out with; they exhaust themselves after consuming large quantities of timber. I know of one man who built a little mill on a mountain-side, and the water ran dry so that he had to leave it. This man had cut down five thousand fine trees, that now lie rotting on the ground.

I believe in selling off the arid pasture land to the people, no matter in what quantity. I think these lands are worth about 25 cents per acre. I believe people will buy them at that price. It is difficult to draw a line classifying these lands. I would confine the term *arid* to lands where there is no water for the purpose of irrigation.

I wish to qualify my statement concerning the timber lands. I would allow the owners of mines upon which had been expended the sum of \$10,000 to pre-empt timber lands not to exceed 40 acres in extent, but I would not allow a mere prospector to pre-empt the timber land; but I would allow prospectors to cut all the timber that they want for temporary use.

---

*Testimony of Charles Popper, cattle raiser, Salt Lake, Utah.*

CHARLES POPPER, resident in Salt Lake, by trade a cattle raiser and butcher, testified, September 10, 1879, as follows:

I have about 3,000 head of cattle. I keep them on my ranch on Green River. In summer-time I keep them on my mountain ranch back of Green River, at an elevation

of between 6,000 and 8,000 feet. The range is about 10 miles square. There is no association of cattle growers here, and we have no way of protecting ourselves against the inroads of other cattle owners, which usually causes us trouble. The local law here does not protect a man in his range. I do not own any improved land. At present the water is very scarce. It is an exceptional year; ordinarily there is plenty of water for my stock. I have my range well stocked—as much as it should be. I think these questions ought to be settled promptly. The present unsettled condition of affairs tends to the destruction of the cattle interest. It requires so large an amount of capital to buy pasture lands that if they had to buy their land it would exclude men from going into the business—that is, men with a reasonable amount of capital, and at present prices. I do not believe that pasturage land should be sold at all. I think it should be leased, and for this reason: This country might all be occupied and ultimately settled in time to come, and it might be detrimental to the government to sell the lands now at such a trifling cost as would justify men in buying large quantities, or to give them away. I would not favor buying in any large amounts; it would be monopoly. My plan of leasing the lands would be better than dividing them into pasturage homesteads. If a law could be made so as to protect the stockman and tax the cattle he would have a possessory right to that range and be able to keep others from jumping in upon him. I think it would be a very good idea to allow one person to have 3,000 acres of land; then, in order to protect the present owners of stock that are now here, to allow them to purchase sufficient land in excess of the 3,000 acres as would support the cattle they now have.

As regards increase or decrease of the rainfall in this country, I would say that I have lived here ten years, and the rain has stood about the same up to this present year.

As regards the number of acres of pasturage lands in this State that would sustain one beef, in my opinion it requires a person to use the range in order to come to any correct conclusion as to the number of acres of a particular tract of land required to sustain one beef. I should say 10 acres to a beef on my range. I mean, by 10 acres, 5 acres on a winter range and 5 acres on a summer range.

A sheep is an animal that is close in grazing. In the first place they tramp the ground more than cattle do, and in the next place they bite down into the roots so that the grass will not grow. I think five sheep will stand against one beef. Sheep and cattle won't go together. I have heard of some conflicts occurring between cattle and sheep men.

I think that cattle can be better kept upon a range which is fenced, better fed within inclosures, will make better beef of an improved quality than if you move your cattle from one range to another. There have been a great many small cattle men in Northern Utah, but they have gone out; they have been bought out by other parties. The tendency in this country has been from year to year to consolidate the small owners of cattle. I will give you an illustration of this. When I first came here I was engaged in the butchering business. I could get at any time, even on the outskirts of the city, as many good beeves as I needed. All I had to do was to go across the river and get the cattle; but ten or fifteen years ago the country commenced to grow up and the cattle were driven farther off. They have adopted a new fence law here, that cattle, if they come on a man's land, shall be held liable for damage. This is a local law. Many people make a business of driving the cattle on to their land and thus obtain the price for improving them. When I went where I am now there were no other persons near me. Now they have made a settlement right next to my range, and cattle men drive their cattle over on my pasturage, so that I shall have to look for another range.

Another reason why small men go out of the business is that they have to drive their cattle a long ways, and there is no security for them because there are no fences. Ranges in this country decrease from year to year by being overstocked. It takes more grass to keep a herd next year than it does this. Grass must sow itself just as any other plant. We have bunch-grass on my range and also blue grass that grows on the bottoms. Now grass seeds in the fall, and you must give it a chance to seed itself. If it is eaten off, seeds and all, it does not come up again, and this destroys the range. If we had a large tract we might by using part at a time protect the seeds, and thus keep up our range. If we were permitted to fence and otherwise protect it the grass could be increased. It is my opinion that if settlers could acquire possession of large ranges a great many people in Utah would be disposed to go to work and raise tame grasses, like timothy, red-top, &c., to winter their herds upon. They could cut these grasses for hay for their stock, and that would tend to rebuild the stock interests of the country. The thing is done now to a great extent. I have one little patch of five acres that I have cut fifteen tons of hay from in one season; and I have one patch that I have cut off the five acres sixty tons of "lucerne;" then again I have 40 acres that I have not cut 20 tons from. This is due to insufficient irrigation.

Question. You stated that you had three thousand head of stock on your range, which is about 10 miles square each way; that would be 100 square miles, or 64,000

acres. Divide that among 3,000 or 4,000 head; that would give about 20 acres to each beef, would it not?—Answer. Yes, sir; that would be sufficient for them, but there is other stock running on the range besides mine, and they are eating out the range very rapidly.

Q. There is another serious proposition of leasing the public lands, which is this: that it would require a swarm of officeholders to collect the rents. Would it not cost the government more to collect the rents than it would come to?—A. No, sir. I think there is a remedy for that. There would be places provided at which to pay this rent, and there should be heavy penalties, so that it would be cheaper for a man to come up and pay than to try and get around it. I do not think it would require many men to watch the land to see that grazers do not get grass for nothing. A man in possession of a piece of land would see that there was no encroachment upon it, and if a man adjoining any other man encroaches upon it the occupant will be put to seek the remedy. If the penalty is severe enough, they will come up and not take the chances of their neighbors' reporting their delinquencies. Thus, unless persons living on the public lands paid the rent they would be trespassers. I do not think that such a course would, as suggested, give rise to a myriad of lawsuits and quarrels, and cause such friction in the management of affairs as to destroy any good that might come out of it, or make the government very obnoxious in attempting to enforce the penalty. As it is, the government gets no rental at all; and if the rental was made very light it would not be obnoxious. It could be very light and still bring in a revenue to the government. I would make the rent light, but the penalties heavy.

Q. That makes the government of the United States, then, the landholder and all these citizens the renters and tenants. Is not that patterning too much after a monarchical form of government?—A. Well, inasmuch as it is for the protection of citizens, I do not see any objection. It might be better for the government to part with the title of the land to private citizens and let them fix, through local courts and legislatures, or arrange themselves, the prices, instead of having the government do it, if they sold it at a small price per acre.

Q. But your idea is that the lands in the Territory will become settled up in the future and then the government might get a better price for it.—A. Yes, sir; that is my honest opinion. The only thing I fear is monopoly.

Q. Suppose the government should rent you, as a cattle man, for a period of years, say five or ten, these lands at a small rental per annum; at the end of that time would you not conclude that you owned the property? Is it not possible that such claims would be made by the people?—A. No, not any more than there would be in the case of any other leased property through a private party.

Q. Would not this renting large tracts for a series of years interfere with the settlement of this land and take it out of the market for the time being, and thus practically create this land monopoly which you fear?—A. Yes, that would have to be guarded against by adequate provisions. For instance, I own a herd of beef-cattle; in order to protect me from monopolies, I would have to make proof of the number of cattle I had, and as they increased I should have to make application for more land.

I would like to say a word in regard to the causes of fire. I will tell you how these fires which you see on the mountains are created. I pasture my cattle in these mountains because there is pretty good pasture there. The country being dry around here, there was a large sheep-herder thought he would take his sheep on to that pasture. My herders told the sheep man the cattle were there first, and that he ought to go away. The cattle men set their dogs on the sheep, and in revenge the sheep boy set fire to the grass, and it communicated itself to the timber.

I should also like to say a word on the subject of Indian reservations. I have a herd of cattle over on the range on Green River. I have been stationed there for four years right at the mouth of White River. Now the Uintah reservation is in close proximity to that range, and the cattle will drift over onto it. Now, while I have got over there a good many herders, there are certain seasons that you cannot possibly keep the cattle out of the Uintah reservation. I have never had any trouble with either the agent or Indians; I have always compensated the Indians by paying them for their grass, and we always get our cattle off as soon as possible, and there has been no trouble whatever. I want to make a suggestion: why would it not be advisable for the government, in case the Indians are willing, to lease the portion of the reservation not occupied by the Indians for grazing purposes. They receive no benefit from it at all; they would then reap a benefit from it, while at present they have none.

*Testimony of W. K. Sloan, manufacturer of charcoal, Salt Lake City, Utah.*

W. K. SLOAN.

Resides in Salt Lake City, and has a place of business in Hilliard, Wyo., and is engaged in the manufacture of charcoal.

He understands the present law to be that no person can lawfully take timber from government lands unless it be mineral land. He thinks that some law should be provided by which timber can be lawfully taken, and that the only practicable method would be by a stumpage tax according to the kind of timber taken and the purposes for which taken. The sale of land for this purpose would not be a practical measure, because the timber is scanty and small in size. If persons who take timber for lumber were compelled to buy the right they would be a check upon the charcoal men, who would also be compelled to buy their privileges, paying so much per cord. The cordage could be readily ascertained.

He is of the opinion that the amount of tax which could be reasonably imposed and collected would be 50 cents per thousand on lumber, and about 10 cents per cord on wood used for charcoal. A cord of wood will yield 40 to 45 bushels of charcoal, worth 5 cents to 5½ cents at the charcoal furnaces. The quantity of wood yielded by the heaviest timber land is sometimes 50 to 60 cords per acre, but over three-fourths of the land the yield would not exceed 10 or 12 cords per acre.

The destruction of timber is effected by careless hunting and fishing parties, and still more by Indians. If the timber rights were sold persons purchasing them would be at once interested in checking them; nor would there be any serious tendency to strip land of all its timber, but merely to take whatever might be usefully and properly taken. It does not pay for any purpose to take timber smaller than 6 inches in diameter. Smaller sizes than that are not desirable for charcoal, and would yield coal too fine.

*Testimony of George Stingfellow, interest in canal, Salt Lake City, Utah.*

GEORGE STINGFELLOW, of Salt Lake City, testified, September 15, as follows:

I am interested in the canals south of the city, and also in the development of the country.

My chief suggestions are concerning the desert-land act. I think it is a very good law, but a section of land is considerable, and I think one-half a section would be ample to give under that act. There is considerable land in this valley, and I presume there is more elsewhere, that has been taken up under the desert-land act with the expectation of getting it through irrigating canals, and many of the people who have taken up these lands thinking they will be able to accomplish this work inside of three years cannot do so, and I now see that they will not be able to accomplish it. I have been laboring faithfully, with a great many others in this valley; we cannot accomplish the irrigation of the land in time. We have all spent money, thousands of dollars. I think the law should be extended two years more, making it five years, for this reason: We have all taken up land and expended means with the idea that we would get it done within three years. The canals have taken more time and money than we thought. I speak of the "Draper ditch." There should be a general law extending the time of entry under the desert-land act, and it should be done immediately, or we will lose what money we have expended because of the expiration of the time. We are compelled to have it done, or else the time we have expended and the money—\$50,000 to \$75,000—will be lost; and I do not think we should be deprived of both the land and the money because we cannot get the ditches done in time.

*Testimony of John Tiernan, John T. Lynch, and others, of Salt Lake City, Utah.*

SALT LAKE CITY, September 13, 1879.

To the Public Land Commission:

GENTLEMEN: It would appear that to give parties as good a title to lode claims as it is within the power of government to do, the area of the surface ought to be increased. On reflection we would call your attention to what we believe will obviate, as far as possible, the present vexations and complex system of the laws governing the acquisition of lode claims.

First. Make but one size of claim, say a parallelogram 1,000 feet in width by 1,500

feet in length, this to be the size of all claims except in cases where surveys have already been made which prevent a locator from taking a claim as herein provided, in which event a claim can be made to conform to the unsurveyed surface, but not to contain a greater area than 1,000 by 1,500 feet, but a less area than this if such surface will not allow the full amount.

Second. The locator shall be entitled to the vein or veins contained within such surface on their dip as far as the same shall extend in depth.

Third. The end lines of claims to extend down vertically.

Fourth. If the party making such location alleges that he has a mineral location, it shall be considered that such is the fact.

Fifth. When such location is made the locator shall place corner posts and notice on the claim, and then file his location notice and statement in the local land office within the district where his claim is situated, for which he shall pay a fee of \$5.

Sixth. When such filing has been complied with it shall then be the duty of the register and receiver of said land office to cause a survey to be made within ninety days, the cost of such survey to be paid by applicant.

Seventh. The applicant shall have twelve months from the date of the approval of the survey in which to pay the government price for the area of such claim, and shall be allowed the amount already paid for survey as payment toward area.

Eighth. If at the expiration of the twelve months aforesaid such applicant shall fail in which to pay the same, then the said location shall revert to the government.

Ninth. In the event of any such reverting to the government, then the same shall be open for entry by any person who will pay for the survey again, and such applicant shall then have twelve months from the date of such payment in which to pay the government for the same.

Tenth. Further, such rule to be continued until such claim is disposed of by the government.

Eleventh. In consideration of the government granting such an area to lode claims the system of locating mill sites and tunnel sites should be abolished, as such have always been a source of annoyance and a detriment to the mining community, the said area being sufficiently large for any owner thereof to erect mills, &c., and the rule will equally apply to tunnel locations, the objects of which are for the discovery of blind lodes, &c. This method of acquiring title to lode claims and the easy manner in which it can be done will enable a locator to cover blind lodes with such location.

Twelfth. In the event of the passage of such a law the cumbrous and defective system of district recorders and local mining laws should be abolished, the records in the land office being sufficient to perpetuate the title until patent issues.

Thirteenth. If such a law can be passed, the solution of how to clear out of the way all old claims, which are, at best, imperfectly represented, and nearly always a stumbling-block against the development of the mineral resources of the country, can be easily reached.

Fourteenth. From and after the passage of such a law give all owners of lode claims and mill sites located prior thereto six months in which to apply to the local land offices for a survey of their claims and to pay for such survey, and twelve months thereafter in which to pay the government price for area, and at the expiration of the eighteen months all claims not so paid for shall revert to the government and be held to the rule as laid down in sections 8, 9, and 10. Therefore, in eighteen months from the passage and active operation of such law, the lode claims of the public domain will be held either by *bona-fide* owners or become public lands again, and in such shape can be controlled by the government, the rightful owners.

Fifteenth. It is not necessary to compel persons to do a certain amount of work on claims, from the fact that the survey required to be paid for by locators is better than to require labor to be performed, which is problematical, if in a majority of cases much is ever done under existing laws.

Sixteenth. Such a law as is here contemplated allows the government to control its own domain at a minimum cost until it parts with the title for actual money, whereas by the law as it now stands persons can perpetuate their claims indefinitely, and the government cannot have jurisdiction of its own, neither receive pay for it—a rule contrary to all business principles.

Seventeenth. The effect of such a law will be to create confidence in mining on lode claims, it being a guarantee to investors and capitalists that their investments will be safe from attack by contesting claimants as any ordinary business transaction.

Eighteenth. It may be argued that, as the law does not provide for assessment labor, little or no labor will be performed. It must be borne in mind that the requirement of perfecting title is of paramount importance, and from the inception of such location the title is so guarded for the owner that the probabilities are that much more labor will be performed than under the old law, where a person is compelled to do labor or perjure himself on a doubtful title, as is done in a great many instances.

Nineteenth. That all disputes or contests in regard to mining lands should be set-

tled before the United States land officers, the same as under the homestead and pre-emption laws, until patent issues.

*Testimony of Alexander Topence, stock raiser, Salt Lake City, Utah.*

Mr. ALEXANDER TOPENCE, residing at Salt Lake City, testified September 10, 1879, as follows:

I have been engaged in stock raising in the northern part of Utah Territory for the past ten years; since about 1869. In my portion of the country bunch-grass is the principal feed for cattle. I have been compelled to move my stock frequently and leave, and also been compelled to fence land in order to save ranges and keep other stock out. This has proven very advantageous to me. On the bunch-grass ranges you must not let the stock pasture both during winter and summer. I have a summer and a winter range, and sometimes I hire a range. I do not hire the land, but I hire some one else to herd the cattle for me on their range. In Utah grass is very much limited and the principal reasons are that sheep are coming in and overstocking the ranges. The practice of rushing on to and overstocking a good range, when it is discovered, has destroyed them to a very considerable extent. That is the reason I went out of the cattle business. Bunch-grass is very quickly destroyed by overfeeding. If you feed on these ranges for three years, year in and year out, it will destroy the range.

If you take your stock and keep them on one range in the winter and another in the summer, that allows the seeds of the grass to fall and does not destroy it. If the grass is destroyed in seed-time it is entirely destroyed, and when the range has once been eaten out in that way it will take five or six years before grass amounting to anything will grow again. I can show you ranges that used to out a ton and a half of bunch-grass to the acre and which are now entirely bare, and sheep are much worse than cattle are on the grass. It is a common practice whenever grazers find a nice range, although it may be occupied by another, to rush their cattle upon it and destroy the range. This is a common practice. If they do not drive their cattle in among those already occupying it they will drive them into the vicinity, and there is no local agreement or understanding to protect cattle raisers. I think the practice tends to the destruction of the pasturage throughout the Territory, and the destruction of the stock interests also.

The remedy I should propose for this state of affairs would be that the government should lease or let these pasturage lands that you cannot cultivate at all. There is very little land in the foot-hills that can be farmed, and I think the best thing to be done will be to lease it, say in 5 miles square, and then the government would have to protect those to whom it leased. I do not know what would be a fair price to pay for these ranges for a term of five years. I have not figured upon that. It would take 4 acres to each animal. As far as my means of determining, approximately, the land necessary to pasture a head of stock goes, I think it would take 2, 3, and 4 acres of bunch-grass to each animal; that is, when you first turn in your cattle upon a new range. I do not think you would feed a range down by having 4 acres to the animal.

As regards the altitude for stock ranges, for small ranges, the higher we can go the better it is. Cattle do best on the highest peaks in summer, but you cannot do anything on the mountains in winter; then you drive them into the valleys.

If the government should find the leasing of lands to be inconvenient and objectionable, I cannot suggest any other method of disposing of its pasturage lands unless the land were sold for some price that stock-raisers could afford to pay. I think that stock-raisers could generally afford to buy considerable tracts of land, and that some men would purchase such tracts at 25 cents per acre. A man could afford to buy 10

that price. I would rather buy at that price than graze it as it is. I would then fence it. We use this wire-fencing, as we have very little timber. That is the great difficulty in this country; there is no timber to speak of.

As regards the number of herders required to take care of 1,000 head of cattle, it is altogether owing to the locality in which you are. If you are in a secluded valley with 2,000 cattle, all you want is a man and a boy, because one man does not want to stay alone. In the branding season, however, you want more. You generally watch your herds in such a manner as to be sure that no cattle, except now and then perhaps one, stray away from your lands. We keep herders on certain ranges that I have busy with the cattle, and if there are any cattle going out they follow and drive them back.

As a general thing we keep our cattle pretty well rounded up, and try to guard them from going off the range. We lose a great many cattle by poisoning in the spring. There is a weed that grows in the spring that poisons them. We call it sea-kale; and then we have the wild parsnip, which is also poisonous to them. We pasture our cattle high up in the summer and drive them down in winter. I think it would be a very good thing if these lands were opened up to private entry at a low price, and that the wants of the stock raisers would be met in this way to some extent. The price should not exceed 25 or 50 cents an acre, and then I think the lands should be classified. A man had better buy it and be protected than allow his cattle to go as they do now. If you have a permanent range, the stock raised there will remain; but if you have to move often, owing to the encroachment of some other persons, then it takes horses and men and costs a great deal of expense, and therefore I would rather have a range that I owned.

Horses and cattle will soon become attached to a range, and I have known horses to go a hundred miles in forty-eight hours to get back to their old range. The changing of a range entails considerable loss, for it makes your cattle poor through driving, and to move the cattle it requires additional horses, herders, &c., and also to keep them on the new range until they have become familiar with it.

If I were enabled to acquire some sort of possessory title I would be able to raise grass for my stock. I have been raising some grass; but unless you have water you cannot do anything. It will pay stock raisers to raise grass if they have the water. Tame grasses, like timothy, blue-top, &c., get ripe enough in this country to make hay about the 1st of July. Wheat would be ripe to cut in the same locality about the same time; they have cut wheat here in June, especially if it be a dry season; this year wheat was cut as early as the 10th of June. Wheat and grass generally go together.

In irrigating tame grasses it is not necessary to use the water at the same time it is for grain. Here we generally turn the water on in winter and allow it to freeze; you cannot injure the grass then. In this way we avoid irrigating in summer. In such streams as Snake and Bear Rivers, and others of that character, we have the highest water about the 1st of June; that is just about when we want it. The waters of the Malad are highest about the 1st of May. If there were large farms for raising hay and for pasturage purposes by irrigation, I don't think the irrigation of the grasses would interfere with the use of the water for agricultural purposes. You can irrigate your grass in winter, and when the crops require irrigation the grass no longer needs it. We have either got to have land pass into private ownership in large tracts, so that there will be some encouragement to raise tame grasses in order to winter the stock, and in that way increase the stock interests of the country, or else we cannot carry on stock-raising hereafter. My idea is that unless artificial means are provided for supplying grass the stock-raising interests of this portion of the country must go down. It is going down all the time now, and there is no hope of artificial improvements by private parties unless they own the ground.

Question. I understand your idea to be, that the stock-raising interests of Utah will be utterly destroyed by the grass being eaten out, and it is eaten out, because other men have come in upon men's ranges and overstocked them; and in order to remove these fellows, you think it is necessary that some means should be provided by which an individual should be enabled to secure his occupancy of a range?—Answer. Yes, sir, I do; and I think that under such a system as that the stock-raising interests of Utah would be very much promoted, and that it would be an encouragement to the raising of tame grasses, and in no other way can the stock-raising interests of Utah be built up. If a man is not protected in the use of a range, everybody's cattle have the same right that he has. It is absurd for a man to make five or six thousand dollars' worth of improvements for the use of somebody else. Selling men the land and protecting them will enable them to raise tame grasses.

Q. Are all, or nearly all, the valuable pasturage lands taken up and fenced, under the Territorial law of Utah?—A. No, sir; not one-sixteenth. I believe there was such a law passed by the legislature. If a man could buy this land for a small sum, and go to work and put up artesian wells and fence the land that such wells would cover with water, it would pay them. Suppose I go and sink an artesian well, sometimes 100 feet or more, capable of watering 1,000 head of cattle; some one else comes up, turns his

cattle loose, and they go right to my well. You cannot move his cattle, because he says you don't own the land any more than he does.

Q. Have you any flowing wells here?—A. We have a few. There are eight at Grantville. The depth of them is 175 feet. They have irrigated 200 acres by means of them. They were sunk last year; they are 200 miles north of here and cost \$1.50 a foot without pipe, and 50 cents a foot more for the piping.

Cattle are worth about \$14 per head here taking it all through. That is not improved stock. They are what we call Utah stock. But now they are bringing in many fine bulls. If the ranges were owned by the persons who own the stock that would tend to improve the stock. I am improving stock now; I have a bull worth \$1,500; I have him fenced; it would be foolish to improve stock when it is among somebody else's. The altitude of my range, which is in Idaho, is about 5,500 feet.

Montana is a good stock country, but it is getting fed off just like this country.

The trouble of the government selling off these pasturage lands, even if they increase the number of acres so that a man could take his family and settle upon his homestead, is that it would not reach the cattle men. You take a man who goes into the cattle business; he does not want to be limited to a few acres. Still I think it would be a very good idea to divide this land into pasturage homesteads at reduced prices. And I should say that in order to make the plan at all successful it would require 2,500 acres for each homestead. It would take at least 10 acres to the animal, but it is hard to say how many cattle could be supported on 2,500 acres of average grazing land.

Sometimes you will find 500 acres of land with not a spear of grass upon it. Then again there are 500 acres that are pretty good grazing land. I think that a man who had 150 cows could, with close economy, support a small family—say, a wife and three children—that is, if he sits down, takes care of his stock, and fences and raises a few vegetables, he might be able to live. He could sell, if he had good luck, 50 steers each year.

Q. If your theory is correct, and if 150 head will support, with economy, a small family, and 10 acres of average land would support a steer, that would make about 1,500 acres which would be absolutely necessary for a pasturage homestead?—A. Yes, sir; 1,000 or 2,000 acres. I have seen land, though, that would not do any such thing. And then again I have seen land 4 acres of which will support a beef, if it is fenced. I consider it desirable to have bunch-grass land.

There are some sheep in this country. If a sheep man comes on your range with his sheep and you can manage to bluff him off and get him away, all right; but if you do not, they will ruin your range. If these lands were sold and fenced it would prevent all this trouble; otherwise, it is the public domain, and every man can range where he pleases.

I have taken up some land in Idaho under the desert-land act. I am carrying a ditch to it which costs \$1,600. This land was taken up under the desert-land law at 25 cents per acre. Now, unless I can prove up on my land next year—I mean that to which I am carrying an irrigating ditch—I will have to lose it. I am doing this in company with other men, but I myself have expended this much money. But we cannot get the water in the ditch this year, and if we do not we must lose it, because we will not have complied with the law. We would produce nothing until we got the water upon the land. I think there should be an extension of time to allow us to get the water on the land.

---

*Suggestions of Edward B. Wilder, James F. Bradley, S. R. Dickson, W. H. H. Bowers, and Prof. J. H. Morton, at Salt Lake City, Utah.*

SALT LAKE CITY, September 10, 1893.

DEAR SIR: Owing to a pressure of business, I find that it will be out of my power to confer with the commissioners, Hon. J. A. Williamson and others, in this city relative to a revision of the mining laws as they now exist, and, by simplifying the same, be the means of effectually putting a stop to litigation that is proving most disastrous by capitalists to the miner of limited means.

The suggestions as made by Mr. Burgess to the gentlemen comprising said Commission I most cheerfully concur in, and having been engaged in mining, engineering and surveying in Cuba where the Spanish laws relative to mines and mining claims predominate, viz, permitting the locator to locate 100 varas by 200 (or, in round numbers, 300 by 600 feet) as a mining claim, within which boundaries he is confined to vertical lines extending downward, irrespective of the vein in its dip passing out of said bounds.

I therefore beg leave to present the commissioners the following: Cause each mineral location hereafter to be made 500 feet wide by 1,000 feet long whose veins shall be confined within said boundaries by vertical lines extending downward from the side and end lines of such location to an indefinite depth, giving such locator the

privilege to locate adjoining his first location a series of additional locations of similar dimensions, not to exceed three in number. By pursuing such course it will hereafter put a stop to litigation and perjury so common in our courts in Utah, by preventing a parcel of unmitigated scoundrels from purchasing abandoned claims for no other object in view than to swing them over the claims of honest men.

Also, by the decision of the Acting Commissioner, Mr. Armstrong, the claimant of a mine must be the person to make affidavit that the notice of application for patent and diagram remained posted the sixty consecutive days. No agent, attorney, or other party can do this according to this decision, as in the case of the Saratoga mining claim, in West Mountain mining district, where the claimants, residing in Saint Louis, had their appointed legal officer to act for them.

Would it not be better to allow two disinterested parties (cognizant of the fact that such notice was posted and remained the sixty days required by law) to make such affidavit in place of the claimant? The owners of a mining claim may be in Europe or elsewhere, and if any one can sign such affidavit, it must in justice be done by parties on the ground who know the posting to have been done for the period designated.

I am, respectfully, yours,

EDWARD B. WILDER,  
*Mining Engineer and United States Deputy Mineral Surveyor.*

Col. C. L. STEVENSON.

---

*Suggestions of Prof. J. H. Morton.*

In making a location allow the locator to make his location 1,500 or 1,000 feet square, and he to be thereafter confined to the mineral within the vertical boundaries of his claim; have his claim defined by posts on each corner; compel him to do his assessment work in the beginning of every year, the year to commence on the 1st day of June in every year; have the work certified to under oath before the recorder.

In recording have the records made within the district, the district recorder to forward to the register of the land office a certified copy of the notice of location, to be entered in a book kept by the register of the land office.

Give the locator five years in which to obtain a patent.

In making a relocation of a claim the party making the relocation shall give the name of the claim he wishes to relocate, and if the recorder shall find that the claim has not been worked according to law, he shall enter the notice; if the work has been done, the application shall be refused.

J. H. MORTON.

---

*Suggestions of James F. Bradley, mine owner.*

1. Amend the present law by allowing, say, two months from date of location of mineral claim, within which time the locator may ascertain the course of the vein and make his side lines correspond with the strike of the vein.

2. Secure by formal enactment to the locator of a mineral claim the right (absolute) to the control and use of all springs and running water within the boundaries of his claim, and which have not been actually appropriated for practical purposes prior to his location.

3. Guarantee in terms the right of the locator of a mineral claim to a mill-site with water privileges (made in connection with said mineral claim) so long as the claim is worked in good faith, without requiring any improvement or outlay on the mill-site & water privileges as a condition of possessory right.

JAMES F. BRADLEY,  
*Mine Owner.*

---

**NATURE OF WATER-RIGHTS—LAWS AND DECISIONS COLLATED TO DETERMINE THE POINT.**

Second in value to the mines of our mineral districts are the mill-sites and water rights adjacent or contiguous thereto. Conflicting opinions and threatened litigation make it desirable that our mining fraternity should be well informed as to their rights under the law in connection with this species of property. Previous to the passage of the United States mining law of 1866, when the unsurveyed and unclaimed mineral lands of the Pacific slope were open to any and all prospectors, it was found necessary, in order to work the placer mines, that water should be diverted from its natural channels and brought in many cases long distances and at large expense to

the points where it could be utilized in washing out gold. Justice demanded and local laws and customs of miners, sustained by decisions of the courts, sanctioned and protected the rights of parties who first appropriated the water thus running to waste. The law of 1866 did not create or enlarge the rights thus accorded, but simply recognized and guaranteed them as just and necessary under the peculiar circumstances.

The common-law doctrine that water cannot be diverted from its natural channel to the detriment of those who use the water and live on or own the land through which the stream runs, might well be ignored under the state of things indicated, for no one lived on or owned the land in question. And so, to a certain extent, this common-law principle was set aside in the cases named. But, while the right of prior possession and appropriation of water was thus recognized, the courts have held, in the language of the supreme court of Nevada, in the case of *Van Sickle vs. Haines* (7 Nevada, 249), "that a patent to land from the United States passes to the patentee the unincumbered fee of the soil, with all its incidents and appurtenances, among which is the right to the benefit of all streams of water which naturally flow through it; . . . and also the same right to recover for a diversion of it as the United States or any other absolute owner could have. That the right of the riparian proprietor does not depend upon the appropriation of the water by him for any special purpose, but that it is a right incident to his ownership in the land to have the water flow in its natural course and condition, subject only to those changes which may be occasioned by such use by the proprietors above him as the law permits them to make of it, and that the common law was the law of the State and must prevail in all cases where the right to water is based upon the absolute ownership of the soil."

The case was carefully distinguished from that large class of cases where it had been held in California and Nevada that priority of appropriation gave a right to water as between appropriators none of whom held the absolute title to the soil.

As it must be conceded that the absolute right of ownership conveyed by patent reaches back and includes the incipient steps required under the mining laws to obtain possessory rights, it follows that the locator who in good faith has located and improved a mining claim has the right to the use of springs and running water thereon unless the same has been appropriated previous to his location and improvement. And this right is inferentially admitted in the case of *Leigh Co. vs. Independent Ditch Co.* (Cal. 323), where the court held that "a complaint alleging that the plaintiffs are the owners and in possession of certain mining claims on a certain stream, and are entitled to the natural flow of the water of the streams, which have been diverted to their injury by defendants, set forth a sufficient cause of action. It is not necessary that the complaint should further allege an appropriation of the water or an ownership thereof." And in 6 Cal. 105, it is declared that "possession or actual appropriation must be the test of priority in claims to the use of water, whenever such claims are not dependent on the ownership of the land through which the water flows."

"A stream is parcel of the land through which it flows inseparably annexed to the soil, and the use of it as an incident passes to the patentee." (2, Law, C. C. 176.)

Under the mining law of 1872, water privileges or mill-sites are located in the same manner as mines, subject to local regulation, that is by definitely locating not to exceed five acres by monuments and recording location notices with the district or county recorders.

No immediate improvement is required, and no limitation of time is given when the right to use and improve them shall expire. Indeed, as "reason is the life of law" there is good reason why there should be no limitation. The presumption of the law is that the mill-site waits upon the slow and expensive process of opening and developing the mine or mines to which it is but an adjunct.

When the mine is patented, the mill-site may be included in the application and patented also without one dollar of improvement on it, be it one year or ten after its location. In the absence of statutory law and of any rule or custom of miners in this Territory the laws of the United States as construed in the courts of the mining States and Territories govern and settle the question of water rights, as follows:

1st. The lawful owner of a mining claim, patented or otherwise, has the right to use the water passing through his claim, and can recover against any one diverting it from its natural channel, unless it can be shown that the party so diverting it had by prior possession and appropriation, prior to the location of said mining claim, a better right thereto.

2d. Mill-sites properly located and recorded, although unpatented, hold good under the laws so long as the locator, his heirs, grantors, or assigns own or work the mine or mines in connection with which the mill-site was selected and recorded, and a cause of action arises against any outside party who attempts to divert the water running through said mill-site.

*Suggestions of S. R. Dickson, Salt Lake City, Utah.*

SALT LAKE CITY, UTAH, *September 11, 1879.*

**Manner of making and recording mining claims.**

Persons intending to make a location should be required to post upon the ground a notice declaratory of their intention, which notice should in a general way describe the direction and extent of the claim, a copy of such notice to be left with the district recorder, who shall indorse upon the back thereof the day and hour which they received the notice. Sixty days should then be given the party to prospect his discovery and determine the course of the lode and to have the same surveyed by an engineer, who should be required to stake said claim, giving courses and distances, and upon his notice of location to mark the same together with a plat thereof, which notice so made with the plat thereof shall be recorded with the district recorder.

**Manner of working assessment.**

Claim owners should be required annually to appear before the district recorder and there, by two competent and disinterested witnesses, make oath that they have performed said assessment work; and it should be made the duty of the recorder to make record of such work. Neglect on the part of the claim owner or their agent to annually make the above affirmation shall work a forfeiture in the claim and render it subject to relocation.

The recorder should be debarred from recording a notice of relocation upon a claim if his records show that the work has been annually performed. District recorders should be government officers, authorized to administer oaths, and should at stated periods be required to make returns to the surveyor-general's office of the Territory of all recorded claims and likewise of all forfeited claims.

All patented claims in Territories should be taxed annually \$10 for road purposes in said district.

S. R. DICKSON.

*Suggestions of W. H. H. Bowers, mechanical engineer, Salt Lake City, Utah.*

SALT LAKE CITY, UTAH, *September 11, 1879.*

DEAR SIR: At your request, I submit the following suggestions in substance that I think would be an improvement in our present mining laws. It has no reference to any particular system of surveys, but refers to manner of making and completing a mining location; and if deemed of importance, would be well to lay the matter before the honorable Commission now in our city.

The point I wish to call attention to is to the fact that in many mining districts throughout the Western States and Territories there is considerable trouble arising from conflicts in location of mining claims, and the fact is the records in mining districts do not fully describe a location so that a correct knowledge of conflicting claims can be determined or located by an examination of said records. It has occurred to me that this trouble could be obviated by requiring each locator to have his claim surveyed by a regular United States mineral surveyor, say within sixty or ninety days after posting such notice of his location. The same to be platted in the district recorder's office and the proper returns made of said survey to the surveyor-general. A failure of such locator to have his claim surveyed and properly platted and recorded within the time specified should be a forfeiture of his claim.

All claims located prior to 1872 and subsequent to that date should be surveyed, &c., as above within ninety days after such law became of force.

As a means of preventing any oppression on the locator, I would suggest that the first year's assessment of \$100 be abated, and that the locator should be entitled to his patent by doing \$400 worth of work on each claim; that the original survey should be final, and locator to be required to prove up his work to entitle him to an application and entry by paying the usual land-office fees and price of land so surveyed.

The effect would be security to investors in mining claims who are not familiar with the locality as to conflicting claims. It would also insure a rapid purchase of such claims from the government of all mineral lands located.

Under present system parties will hold claim after thousands of dollars have been expended in development to save the expense of surveys, and the government not receive a cent.

Under present system parties not familiar with location and conflicting titles find, after spending large sums in developing, that an adverse claim has the precedence,

and the result is innumerable lawsuits and annoyances that deter legitimate capital from investing in mines and mining enterprises; from their past experience or observation of others they see themselves robbed, so to speak, of what they really think their rights, but in fact caused by the imperfection of our laws mentioned.

This alone has had a greater and more damaging influence to development of our mineral resources than any other case. Men say if they have a good mine they are robbed of it by some old title that was overlooked in records or so imperfectly described as to guard them. If platted and described, it could be more readily detected.

It is not necessary to refer to any special case, but you are no doubt aware that hundreds of such cases have and do now exist in Utah. The records of our courts also substantiate this trouble.

As no one feels a greater interest in the development of our mineral resources than I do, I would be glad to see some law passed that would prevent such conflicts and insecurity to investors, and hope this or some better plan may be adopted speedily by Congress in amending our mining laws.

Respectfully, yours,

W. H. BOWERS,  
*Mechanical Engineer.*

Col. CHAS. L. STEVENSON,  
*Mining Engineer.*

---

*Suggestions of E. B. Wilder, Edward Wilkes, Lewis J. Hohnes, Joseph Gorlinski, Thomas E. Bailey, and Charles L. Stevenson, committee of civil and mining engineers, Salt Lake City, Utah.*

SALT LAKE CITY, UTAH, September 11, 1879.

To the United States Land Commission at Salt Lake City, Utah:

GENTLEMEN: We transmit herewith a digest of the suggestions offered at a meeting of civil and mining engineers of Utah concerning a modification of our mining laws and the instructions thereunder.

E. B. WILDER,  
EDMUND WILKES,  
LEWIS J. HOHNES,  
JOSEPH GORLINSKI,  
THOMAS E. BAILEY,  
CHARLES L. STEVENSON,  
*Committee Civil and Mining Engineers of Utah.*

---

*Suggestions made at a meeting of civil and mining engineers, Salt Lake City, Utah.*

Mineral monuments and meridian line or lines in each district. A proper base line also between two of the principal monuments, established at government expense.

District recorders to be elected by a vote of mine owners, as heretofore. Such recorders to furnish the United States with a proper bond for faithful performance of duties; such bond to be satisfactory to the surveyor-general of the Territory.

When a notice of location is made in the district records, a certified copy to be also immediately filed with the surveyor-general. And *quere*: Whether a full copy of past records should not be filed with surveyor-general?

All relocations should be recorded as such, and the name of the original claim given, or otherwise to be void.

Upon unpatented claims oath should be made by the owners or their agents and two witnesses, before the recorder, that the yearly assessment work has been done, and such statement be placed on record, and in that case the recorder should be obliged to refuse the recording of a relocation, and so prevent expensive litigation.

*Quere*: Whether local laws should or should not abridge the width allowed by the United States law?

*Quere*: Old Spanish law *redirivus* as to surface locations?

United States deputy surveyors should have the privilege to swear their assistants in and out. The surveyors often have to travel great distances to find the office of a notary or a justice, and then on arrival find the officer absent, the costs incurred in some instances equaling the cost of survey. (*Vide* instructions November 20, 1873.)

Owners of claims made prior to 1872 should be obliged to amend notice of location by official survey, stating clearly course and position of the lode or vein, and mark their boundaries distinctly on the ground, it being understood that the amended notice does not interfere with their prior rights.

*Quere*: Whether parallel end lines are essential?

The number of each mining claim officially surveyed should be on record with, and the deputy mineral surveyors shall give the same to, the district recorder.

Appointment of a mining inspector to look after the safety of mines and miners.

Surveyor-general to have power to restrict the number of deputy surveyors.

EDWARD B. WILDER.

EDMUND WILKES.

LEWIS J. HOHNES.

JOSEPH GORLINSKI.

THOMAS E. BAILEY.

CHARLES L. STEVENSON.

*Testimony of Edward B. Wilder, United States deputy mineral surveyor, Salt Lake City.*

The questions to which the following answers are given will be found on sheet facing page 1.

*To the honorable Commissioners of Public Land Commission :*

GENTLEMEN : I have the honor to present for your consideration the following answers, replying to a portion of the interrogatories propounded in the circular issued by your honorable body, viz :

Name, Edward B. Wilder; residence, Salt Lake City; occupation, mining engineer and United States deputy mineral surveyor.

On the subject of lode claims I would respectfully suggest in connection with the interrogatories the following :

1. Thirty-nine years, of which seven years were in the Cuba mines, Island of Cuba, as superintendent and mining engineer, and the remaining thirty-two years in different sections of the United States, including three years as superintendent, mining engineer, and mining expert of the Ophir mine, on the Comstock lode, State of Nevada; as also seven years of the above period in this Territory as mining engineer and United States deputy mineral surveyor.

2. I find many defects, in which my subsequent replies will explain.

3. The present official practice has fully demonstrated the practice to be erroneous, inasmuch as it is productive of litigation. If all surveys hereafter to be made were in the form of a parallelogram there would be very few adverse claims—say 500 by 1,000 feet, or, as the present law now stands, 1,500 by 600 feet.

4. The top or apex of a vein or lode is the point at surface where the ore is met with, either superficially seen in the croppings or just beneath the surface. The terms I consider vague, inasmuch as denudation would have a tendency in a soil free from impediments, as rocks, &c., to expose the ores lying some distance beneath the surface, thus opening a field for difficulties in the future, while perhaps the legitimate apex would be considered as at the outcrop of the vein; and there are very few exceptions but what, after sinking a few feet, the dip and course can be determined sufficiently to make a survey of the location. The Ophir mine was an exception as regards the dip, for in the first developments made the dip was west, and after an incline shaft had been sunk on the vein for over 200 feet a cross-cut was driven from the bottom, over 150 feet east, when the walls were found; the hanging wall in the first instance became the foot wall, and has continued as such for over 2,500 feet in depth.

6. It has most decidedly, as in the case now before the courts of the Stewart mining claim against the Edison, when the so-termed apex was found on each claim; the result being that the claims being contiguous in part, the foot wall of the Stewart crosses the side line of the Edison diagonally, and hence the expensive litigation now in progress.

7. The Stewart and Edison veins, which are formed separate by an intervening mass of country or barren rocks between the two, are as follows: Edison foot wall, N. 5° 45' E.; Stewart hanging wall, N. 33° E. In the lines of divergence from a point on the Stewart country rock exists between the wall of one and that of the other.

9. They occasionally occur wider than the local laws allow, but very rarely, and in no instance coming under my own observation do they exceed 500 feet in width.

10. They do.

11. It works to the disadvantage of the discoverer of a true vein.

12. In Uintah district is the following: Swift locates a claim; subsequently Evans makes a location from certain infallible proofs and sinks a shaft on the vein; has a survey made for United States patents; Swift then has a survey made which absorbs nearly all of Evans's claim; sinks a shaft 80 feet deep in limestone (while Evans is on the vein) from his discovery, and intends filing a protest against Evans.

13. In almost all cases of litigation the causes assigned are when the vein passes the exterior lines of the surface tract diagonally or otherwise.

14. I do not think it possible that they can without litigation.

15. I have never taken part, directly or otherwise, in organizing a mining district.

16. The general mode of taking up and locating a mineral claim is as follows: One or more individuals start out with pick and shovel; if there are rich mines in the vicinity they generally commence an examination, taking in many instances the general course of the vein as seen on other productive properties. When anything indicative of an outcrop is seen a foot or two is sunk; if they think it promising, a notice is written with pencil, a mound of stones erected, and that constitutes their right to the claim. In other instances locations are made adjoining good mines without there being the least indication of an outcrop, the motive being to eventually "blackmail" the adjoining mines. Again, most of the locations are made without any direction, simply inserting the course northerly and southerly for north and south, &c., thus leaving a margin at the option of the surveyor to swing on.

17. If the original notice of location is amended as regards course and distance, it destroys the former date of same, and the date of such amendment takes precedence.

18. From my own personal knowledge I am not aware of any, but I am informed that accusations of that nature have been made by parties.

19. I would most respectfully suggest that all mining-district laws, customs, and regulations as they now exist be abolished, and all future locations and the initiation of record title be placed exclusively with the United States land officers, their charges being excessive (and are too often under the influence of disreputable parties), giving no bonds, and in fact exercising a baneful influence.

20. The present system of allowing the courts to adjudicate on adverse claims is highly detrimental not only to the litigants but to the government, as it places a barrier to disposing of the mineral lands at once, to say nothing of delays and the great expense attending the same. I therefore am of the opinion that all controversies concerning mineral lands should be left to the United States land officers, in the same manner as contests under all other land laws, with no appeal from their decision except to the Land Office at Washington.

21. I would suggest that the leading features of the act of May 10, 1872, be in a measure retained; that all claims hereafter made should be in the form of a parallelogram, beyond the end lines of which the vein cannot be disturbed by entering another claim; or, in other words, let vertical lines from the surface of such parallelogram constitute the claim downward, and in case the dip of the vein should pass out of the vertical lines, let the owner take up as many claims as may be deemed expedient adjoining, in order to protect the dip of his vein. In other words, an embodiment of the old Spanish mining laws in our present mining laws, after reconstruction, will put an end to the course of litigation that is ruining thousands.

22. There ought to be a limitation as to possessory title under the mineral laws, from the fact that there have been taken up locations by parties long prior to the act of May 10, 1872, who, in fact, hold them to the exclusion of others that would develop them. Many of these locations are made in the vicinity of good mines, with no other motive than to protect the rights of legitimate mine owners, and eventually sell out, as parties holding good properties would rather submit to "blackmail" than be involved in litigation. The mining districts are full of such cases.

In reference to question No. 2, I would say that the principal defects in the United States mining laws are in regard to permitting the owner of a mining claim to follow the dip of his vein outside of his claim, as indicated by his boundaries superficially; which, as before stated, is the inevitable step to litigation. As an instance: the Stewart Company in West Mountain mining district owns a claim, purchased, being an old location unpatented, 200 feet wide. From the northern side line of this location to the south side line of another good mine is a distance of 370 feet. This last claim has made application for United States patent. The former claim, owned by the Stewart Company, filed an adverse claim on the ground that the dip of their purchased claim passed into the claim of the latter, passing through 370 feet unclaimed by their location and undeveloped.

I am very respectfully, your obedient servant,

EDWARD B. WILDER

SALT LAKE CITY, October 15, 1879.

*Testimony of Edward Eldridge, farmer, Whatcom, Wash.*

The questions to which the following answers are given will be found on sheet facing page 1.

WHATCOM, WASH., October 20, 1879.

To the members of the Public Land Commission:

GENTLEMEN: In response to a circular addressed to me submitting a number of questions, under different heads, relative to the disposal of the public lands, answer

to which are requested so far as my experience or knowledge extends, I take pleasure in answering such questions as come within the range of my observation, and also submitting a few ideas for your consideration.

1. Edward Eldridge, Whatcom; a farmer, formerly a sailor.
2. I have lived here twenty-six and one-half years.
3. I acquired title to 320 acres of land under the donation law, one-half to me, one-half to my wife. I have purchased for various persons land by private entry at \$1.25 per acre.
5. I will not refer to this, as others more conversant with it will answer better than I can.
6. I have observed defects in the practical operation of the land laws, and this neighborhood is suffering from these defects. In this vicinity about 60,000 acres of land is owned by non-residents. The land bordering on about 50 miles of shore line was surveyed at an early day and placed in the market nearly 20 years ago, and was all purchased by speculators during a railroad excitement. A large portion of the land immediately behind this, not being in the market, was squatted on and a pre-emption right proved up, and by the squatters swearing for each other, paying for the land, and then leaving, and to-day not one of those claims out of a dozen shows any signs that any improvement had ever been made; consequently, with the exception of a few front claims occupied by the early settlers under the donation law, you must go back through the woods from 5 to 10 miles before you come to a settler. The suggestions I would offer as a remedy I will give hereafter.
7. The conformation of the lands in this county and all of Western Washington is mountainous, embracing every form given to the surface of the earth, some places being too precipitous for traversing, some gradually sloping, some beautiful table-lands, and some rich valleys and river bottoms. There is a larger percentage of rich agricultural land in this county than in any other in the Territory proportionately to its size; all that is not fit for agriculture is excellent for pasture for one class of animals or another. Coal exists to a large extent in this county and generally throughout Western Washington, and upward of 90 per cent. of the land in this county is timber land.
8. I do not think the character of land could be classified by a general rule, nor yet by geographical divisions, but each local land district could classify their lands from the explorations of the land surveyors.
- 9 and 10. I will embrace in my ideas at the close of this.

#### AGRICULTURE.

1. The climate here approximates that of the south of England more than any other; it is more equable than any other portion of this continent, and for a salubrious, genial, healthy atmosphere it is not surpassed by any place on earth; twenty-six years' experience by one who has been in every quarter of the globe proves this to me, but for the benefit of those unacquainted with the motions of winds and ocean currents, and who would feel an interest in knowing where a genial, healthy climate exists, I will give the causes. Water refracts the rays of the sun, the earth absorbs them, hence in the hot season it is much warmer at any given latitude in the middle of a continent than it is in the middle of an ocean at the same latitude. Fresh water freezes quicker than salt water, and snow and ice accumulate on land much more than on the ocean in the same latitude, and keep the temperature of the atmosphere lower in winter on land than it is at sea. Another natural law causes the wind to blow from the west in high latitudes more than from any other quarter; it therefore follows that winds blowing across an ocean carry a warmer volume of air in winter and a cooler volume in summer than winds blowing across a continent. This is the main cause why it is warmer in winter and cooler in summer on the west coast of America and of Europe than it is on the east coast of America and Asia at any given point of latitude above 45°. The ocean currents aid this action of the winds, and although the coast of Europe is favored more by ocean currents than the west coast of America, that is counterbalanced by the monsoons of the Pacific, which greatly favor the west coast of America. On this coast the winds nearly always blow from the south during winter, giving us a mild atmosphere, with copious rains; and in summer the wind blows from the north, bringing with it a cool, healthy, invigorating atmosphere. It is the opposite on the Asiatic coast.

Again, an immense chain of lofty mountains traverses the whole continent of America parallel with and but a short distance from the western coast, against which the winds from each side strike and produce a greater difference between the atmospheres on each side than would be produced by the distance of 1,000 miles toward the interior of a level continent. This causes our genial climate.

The rainfall here is sufficient for all purposes of agriculture. We generally have rain every month in the year except July, August, and September, and sometimes every month. This year it has rained every month.

Our seasons here may be called all the year round. I sow cabbage-seed in September and transplant in March, and not over one winter in ten will the plants need covering during the winter. With the exception of unusual storms, a man can work out of doors all the year round. The average fall of snow for twenty-six winters I will call 6 inches, and lies about a week. One winter we had snow for four months. Two winters I neither saw ice nor snow.

2 to 11, inclusive, is answered by saying that the clouds sufficiently irrigate Western Washington.

12. In Western Washington there is no land but can be used for other purposes than pasturage. It is valuable for timber or some kind of mineral or coal or stone.

13, 14, 15, require no answer.

16. In this section no one relies solely on raising cattle.

17. In this county I do not think there are over 3 head to the square mile.

18. There was no grass in the woods. All the pasture we have has been propagated; but when once started this is the finest pasture land in the world, the grass and clover being green all the year round and the timber affording shelter from storms in winter and from the sun in summer. The cattle spreads the pasture by the seeds passing through them.

19. Very few fence their range.

20. I think it would be a hard matter to raise better beef than we do here.

21. Springs, creeks, and rivers.

22 to 26. I have had but little experience with sheep, and there is not 1,000 head in the county.

27. I will answer fully hereafter.

28. It is almost impossible to find the corners of the surveyed sections, owing to the fires that have swept the woods from time to time, obliterating the marks that were put upon the trees and burning up posts or stakes that may have been put in the ground.

#### TIMBER.

1. All the land here is timber land, comprising fir, cedar, spruce, maple, alder, and other small varieties.

2. No timber is planted here except orchards—that is, in Western Washington. It is difficult to determine what kind of timber is the best, although, all things considered, fir may be the most valuable. I believe fir continues to grow from 500 to 1,000 years.

3. I would dispose of the public timber lands, as I would all other lands, by lease only. I will give my reasons hereafter.

4. I would certainly classify the different kinds of timber lands. Some of this timber land is the richest kind of soil, and will make the most valuable kind of farms when the timber is cleared off and the stumps out, while other lands would be of no value after the timber is removed unless it should be for the stone or mineral that may be on it. Forty acres of timber land is as much as any one man can change into a farm during his lifetime. No person who settled in Western Washington that I know of has 40 acres under cultivation whose claim consisted of timber land altogether. Our timber lands are the most valuable of all lands, because a family can settle on them with a smaller capital than on any other. The timber furnishes them all their buildings, fencing, fire-wood, and many other things, all of which they would have to purchase if they settled on prairie land.

5. When we clear off the timber unless we cultivate the land in a few years it would be a dense jungle. Alder comes first, and afterward cedar and fir.

6. Regarding forest fires, I presume since whites first settled here more than half of Western Washington has been burnt over, some of it several times. When we have a very dry season it is impossible to keep fires from spreading. A man settles on a piece of rich timber land with the intention of making a farm. The timber is of no value to him except what he needs himself, unless his land borders on the water. His greatest desire is to get rid of the timber as fast as he possibly can. The ground is covered with dense underbrush, consisting of vine, maple, cactus, all kinds of berries, thorns, nettles, weeds, &c., almost impossible to get through. The settler's first work is to clear off the underbrush from a piece of land for a garden, house, &c., and hopes for a dry summer to burn it up. Should a very dry season come his fire is sure to spread. And to tell him he must not burn it you might as well tell him he must not eat his dinner. But of late years fires do not spread so much, 1st, because the seasons are wetter than they were ten and twenty years ago; and, 2d, because most of the dead timber that had been accumulating for ages has been burned, and in its place is a dense growth of young green timber, which keeps the sun's rays from drying the ground, and makes it very difficult for fires to run.

7. In regard to depredations upon the timber, I think there is but one kind that should be stopped or caused to pay—that is, cutting saw-logs for the manufacture of lumber or spars for export. If the government allows the Northern Pacific Railroad

Company to cut all the timber they may need for the construction of their road it would be a caricature upon justice to stop anything else except the two cases I have mentioned.

8. There has been but little timber cut in this county yet, so I can give little information on this head.

9. I consider everything connected with the public lands ought to be under the jurisdiction of United States district land officers.

#### LODE CLAIMS AND PLACER CLAIMS.

I know but little of these, and therefore won't refer to them; but as the law makes it your duty to recommend in your report to Congress whatever you may deem wise in relation to the best method of disposing of the public lands to actual settlers, and as you have submitted certain questions to me and invited me to give my opinions and reasons therefor, I shall now proceed to do so.

I will first state I am a native of Scotland. I have read much; I have seen a good deal of the world. I know and appreciate the value of the United States form of government, and the sole reason why I take the trouble to write this is in order to contribute, as far as lies in my power, toward the preservation of that form of government, so that others who are to come after me may be able to enjoy the same benefits that I have and am enjoying. They who know no danger fear none. A man who has never felt the pangs of hunger cannot feel for those who do. No one can appreciate the benefits of a good form of government until they have experienced the evils of a bad one. Few native Americans can realize the true value of land or the blessing of having a home of your own.

We talk of disposing—that is, buying and selling—the land, the soil, the earth, as we would a pound of bread or a piece of cloth. Who made the earth, and for what purpose was it made? It was made for the use of the beings who may be on it, but only for their use while they live upon it. The Creator of the earth never designed that one being should have the exclusive control of sufficient of the earth's surface for the comfortable maintenance of a million; nor was it designed that any being should have any authority with the disposal of the soil after he had passed away. Every man who wishes to cultivate the soil has a natural right to the possession of as much of it as will enable him by his own labor to procure the means of existence for himself and for those dependent upon him, and no man has a right to more. This is the law of God. What would policy require the law of man to be in the United States? What has made the United States the most powerful nation on earth in such a short period from its birth as a nation? Was it the intelligence of its people? Not that alone, for the same intelligence can be found in other lands. Was it the form of government established? No; for that form of government could not have existed for a hundred years in any part of Europe in the present condition of man. It was the freedom and boundless extent of the soil. This secured the individual independence of the people; and so long as that independence can be secured a popular or democratic form of government may continue to exist and prosper; but when once a majority of the people are dependent upon others for their daily bread, their independence ceases and a democratic government will commence to decline.

Carlyle wrote truly when he wrote: "Where no government is required save that of the parish constable, as in America with her boundless soil, every man being able to procure labor and recompense for himself, democracy may subsist, but not elsewhere, except briefly, or as a swift transition towards something other and further." So long as an acre of land fit for cultivation is free and open to any one who chooses to go and occupy it, our government may continue to prosper; but whenever that last acre has become private property, our form of government will commence to receive the strain that will test its strength. Why? Land is the true source of power, and the balance of power changes with the balance of property. As the disposal of the soil of any nation rests with the one, the few, or the many, so is the dominion of that nation in the hands of the one, the few, or the many. It has been the tendency in every land for the ownership of the soil to concentrate in the hands of a few; it is so in the United States, but not to the extent that it will when it is beyond the reach of a poor man to become a land owner; and does any intelligent person think for a moment that our form of government could exist if the ownership of the soil approximated to that of England?

Some patriots may say that the American people are too intelligent ever to overturn or abolish the best form of government that ever existed. What will that intelligence teach them? Every sane American who can read will know that his political creed teaches him "that all men are created equal, that they all are endowed with certain rights, and to secure these rights to all is the purpose for which governments are instituted." What is the meaning of the right to life? Does it mean that a man may die of hunger while he is striving with all his energies to obtain the means of existence? Most assuredly not. The earth will produce enough for the comfortable

subsistence of all; but if some have a great excess, others may not have enough. To regulate this is one of the objects for which governments are formed. Now what will be the course likely to be pursued by a mass of people writhing under the pangs of cold and hunger whose political creed teaches them these things, while they see millions of acres of land held by men who have no more just right to them than they have, and which may not be used for the purposes for which they were made, especially when their political creed further teaches them that whenever any government fails to carry out the purposes for which it was formed it is the right of the people to alter or abolish it? Will they quietly continue to suffer and die, or will they exercise their right? Who can doubt what will be their course? Then comes anarchy, to be followed by a government of force, deriving its powers without the consent of the governed. The first step to be taken in endeavoring to prevent the same fate for the American Republic that befell the republic of Rome is to awaken the people of America to a sense of the danger that is rising before them, and once conscious of that fact it might be possible to provide a remedy, and no possible opportunity could arise where such a warning could more appropriately be given than in your report to Congress. If all the public domain is allowed to become private property it would require as terrible a struggle to destroy the owner's right to it as it did to destroy the ownership in man, and yet no man has any more just or natural right to an absolute right of property in the soil than he has to an absolute right of property in his fellow man. Every man has the right to the possession of a portion of the earth so long as he uses it for the purpose for which it was created; but no man has a right to the absolute control of land of which he makes no use. In this Territory there are thousands of acres of land lying idle, owned by persons who purchased it from government for \$1.25 per acre, and who would now ask \$10 or \$12 per acre from any one who wished to use it, thus becoming rich from what Mr. Mill terms the unearned increment of that land. The government that tolerates such a course of action is not securing to all the rights with which their Creator endowed them.

Suppose any one was to say to that government that is so liberally giving away what don't belong to them, You are dealing very liberally with me, giving me 160 acres of land for nothing, but have you ever thought whether my grandchildren and their grandchildren will all be able to get 160 acres each for nothing also? They will have the same right to get it that I have, and rest assured if they don't get it there will be trouble in the house. They won't be bluffed off with the answer that if they wanted land for nothing they should have been born a hundred years ago. They will answer that the soil of America was not made for the exclusive use of those who lived a hundred years ago, but for the general use of all who inhabit it through all ages.

There is no monopoly so oppressive and so destructive of the principle of equality as monopoly of the soil, and the government that fosters and protects it is trampling upon the principles set forth in the Declaration of Independence. To carry out those principles, the soil should be leased in small quantities to every one who wished to cultivate it himself, an appraised value being put upon it at the time he obtained possession. Every tenant should pay a yearly rent for the land, which rent should go into the public treasury: so much into the county treasury where the land is situated, so much to the State, and the residue to the national treasury. This fund would more than suffice to meet all expenses of government. At the expiration of the lease, or at the death of the tenant, the land should be appraised, and, if of more value than when the lease commenced, the amount of the accrued increment or the increased value arising from the acts of the tenant shall be paid to him or his heirs, while the unearned increment, or increased value arising from the acts of others, shall remain with the land, and a higher rate of rent put thereon for the next tenant, the heir of a deceased tenant having the first claim.

If this is too great a change to be carried out at once, a step toward it would be made by the passage of a law prohibiting any individual from owning more than a certain number of acres of land; and if the government is not ready to do that, in the name of humanity don't let the residue of the public lands be a bait for greedy speculators. let no one get more than 160 acres, and let no one get any who owns 160 acres: 160 acres is more than enough for any family if the land is fit for cultivation.

The world is beginning to open its eyes to the land question. In most countries where civilization exists the land is completely owned by a small fraction of the population, and the governments of these countries have to be sustained by large armies of men. Not one of them could exist solely from the consent of the governed. Many able men are advocating a modification of the land laws, but they all approach the subject in a very delicate manner, well knowing the power they have to contend with. But this is the country where the problem of the ownership of the soil should be solved for this is the only country that acknowledges it to be the duty of government to secure all persons in the possession of the rights with which their Creator endowed them, and the sooner the attempt is made the easier it will be to carry it out.

It would require volumes to treat this matter as its importance requires, and I have not the time to spare to enter upon a work that may not be favorably received; but I

could not, consistent with my sense of duty as a citizen, allow this opportunity to pass of presenting my opinions upon a question of so vital importance to humanity at large. It is not among mass meetings of discontented and riotous men that these questions should be agitated, but it is in the legislative halls and before such commissions as yours, where a remedy can be peacefully applied, that these matters should be ably and fully and impartially discussed. The time is fast approaching when our political creed will have to be changed, or else the principles contained therein will have to be faithfully carried out.

I am, respectfully, your obedient servant,

EDWARD ELDRIDGE.

*Testimony of Elwood Evans, attorney-at-law, Pierce County, Washington Territory.*

The questions to which the following answers are given will be found on sheet facing page 1.

Answers to certain questions submitted by the Public Land Commission.

1. Elwood Evans, New Tacoma, Pierce County, Washington Territory; attorney-at-law.

2. Have lived in Washington Territory ever since it was established as such, having come to this section while it was Oregon (November 10, 1851); lived at Olympia, the capital, till December 1, 1878, since which time have made New Tacoma my residence.

3. Have never been able to believe that I could *bona-fide* avail myself of the privileges of either donation, pre-emption, or homestead laws under their *true intent* while I had no real design to become an agriculturist, and was in the practice of my profession, which I could not abandon, compelled to reside in some town.

4. Have had considerable practice in the Territorial land offices; have made the donation, pre-emption, homestead, and coal laws a matter of study and especial attention.

5. During the whole history of the Territory our land officers have, with a true spirit of accommodation, advised settlers and claimants of the public lands as to the *modus operandi* of acquiring titles. I think (and I believe it is rather jealousy of what is due to my profession than selfish, but it is honestly believed, whatever the stimulus) that the services of attorneys have been thus rendered unnecessary by this too liberal custom, when their employment would have been advantageous, even economical, for all concerned. It is my opinion, based on a long experience, that practice in the land office should assimilate to the mode of conducting business in courts; that persons having business in the land office should be required to make their own showing, just as pleadings, petitions, motions, &c., are prepared, preliminary to the hearing in other courts. A register should no more prepare papers which constitute the application he is to grant or deny than a judge should a motion for continuance or new trial. Conversely, the land officers should decide matters presented for their action, not advise how a case shall be presented. Such a system imposes labor on the officer for which he is not compensated. It may be possible to some extent to compromise him. Much of the duty of the register and receiver may be of a judicial nature. Clerical or ministerial duties prescribed by law are not here referred to. I cannot recall a single instance in twenty-five years' practice where there has been just occasion to complain of unreasonable delay or expense to settlers in securing titles to their claims. Let me qualify this. From the practice which has been adopted I think there has been unnecessary expense entailed, but for this the local office is entirely blameless. Nor do I know, under the law as it now is, that any one is censurable. In contests before the register and receiver those officers, instead of being judges, as they really are and should be, are *pro tanto* reduced to mere commissioners for the taking of testimony to be certified up to the General Land Office. Every statement that is offered has to be received and reduced to writing. Every question that is asked, relevant or not, objected to or not, must be taken down. A voluminous record is made, often useless, expensive, and eminently unsatisfactory. Of course cases may arise when the hearing by those officers is merely preliminary to presenting it to the department, in which case such a course becomes necessary. But in most cases it would be the wiser plan to have the cause tried upon its merits by the local office. The decision presenting the facts, the affidavits necessarily showing the basis of claim or right, the evidence corroborating or rebutting, and the exceptions of an aggrieved party would be all-sufficient to secure substantial justice.

In my opinion, subject to the right of exception to their ruling, the officers should be fully empowered to decide the relevancy and materiality of testimony and witnesses, to exclude irrelevant testimony, forbid cumulative testimony, and limit the number of witnesses on any particular fact; in short, to try a contest as a judge tries a cause without the intervention of a jury, saving to parties litigant their right by bill of excep-

tions to save the testimony they desire saved for purposes of review. This would greatly abridge the labor of the officers, the time of the trial, the record, and in every way be a reform. The register and receiver should be a court or tribunal whose judgments should be *res judicata* continuing with the effect of absolute settlement until reversed on appeal or review, and becoming absolute if not appealed from within a certain time. An unappealed judgment of the local office should be confirmed by the Commissioner, as of course. The register and receiver for these judicial functions should be paid a salary. If the parties to the controversy desire the testimony taken to be certified up with the case let them secure it as it is done in court. A register and receiver acting as judges should not have their attention diverted as mere clerks. The settlement of a controversy, if not appealed, by the local office where the parties, witnesses, &c., are better known has so many advantages comment is unnecessary. It is unjust to leave everything in abeyance till affirmed by the Commissioner or the Secretary of the Interior after months or even years of delay. The decisions of the land officers in this Territory have always been commendably prompt. The delay which has occurred, as a rule, has been between the time of the action by the local officers and the affirmance or rejection by the General Land Office. This would not occur if unappealed cases did not require re-examination. The accustomed long interval between certifying for patent and issuing patent has been a cause of sore annoyance and real grievance in many instances. It is needless to more than refer to such a condition of things to expose its hardship and injustice. A settler for years is left in doubt as to the validity of his title, the regularity of the proceedings. The patent is withheld, he knows not why. His title is questioned, he cannot explain. He cannot call his own and fully enjoy that which he has earned and rightfully should possess.

6. Our land laws are very liberal and beneficent. I favor the homestead principle which secures homes and *per se* shows good faith. The government may not be prepared to dedicate all agricultural land subject to its right of eminent domain to homestead purposes. If it is I would make that law the uniform system of settlers acquiring agricultural lands. If the pre-emption law is adhered to it should be administered strictly to defeat its being used for the mere purpose of acquiring lands from the government. To the actual settler who makes *bona fide* improvements, and by the character of those improvements he exhibits *bona fides*, I would give the amplest opportunity and most liberal terms to secure the title. The land offices should be clothed with a fuller discretion to consider the equities which may present themselves in a case. It is impossible for a Commissioner, however able and thoroughly informed, to anticipate what may arise in a case in a country like this, or to fix a rule upon which a positive instruction is given to the local offices, which subjects an honest settler to great hardships and sometimes deprives him of his land—not from any fault of the settler, but because the rule is really too impracticable to be literally carried out. If a party places himself within the spirit of the law and of the rule, and shows why he has not complied, there are cases when he is as much entitled to affirmative relief as though literally executing both law and instruction. It is equally plain that some settlers exhibit truer *bona fides* in the expenditure of their all, though that is but a few dollars, who give all their labor they can spare, for they have a duty to those dependent upon them which may compel them to labor elsewhere than others more fortunate who exhibit on final proof the results of hired labor to the amount of thousands. This needs no elaboration. On the 14th of March, 1871, Honorable Daniel D. Pratt, then United States Senator, delivered a speech in the Senate on the "rights of settlers upon public lands," which I take pleasure in referring to as expressing views more ably and perspicuously than I could hope to, were it proper for me to obtrude them in this paper.

7. Pardon me for inclosing the "centennial address on this Territory, delivered at Philadelphia, in 1876." It supplies as definitely as I can, with my limited time, the data sought by this question. I also inclose a portion of an address on timber recently delivered at the annual fair of the King County Industrial Association. While I have matured no system, I am clearly of opinion that the time has fully arrived for making a minute and detailed survey of the timber regions of the States and Territories with as much care, precision, and method as is adopted in taking the census, and also for the adoption of some rigid system to reserve, protect, defend, and render remunerative and useful this invaluable resource to any region in which timber may be found.

8, 9, and 10. Principally answering the latter, but incidentally having 8 and 9 in mind. I have already referred to Ex-Senator Pratt's able speech on the philosophy and animus of our land system. His bill (S. No. 10 of that session) on page 3 of said speech is an admirable nucleus, about which may be constructed a perfected system of homestead and pre-emption rights, to which modes of acquiring land agricultural lands should be restricted. The avenue for absorbing the public domain other than in the legitimate uses of actual settlement should be rigidly closed. The time seems to have arrived to begin to save the land for the needs of settlement, to the exclusive appropriation for homes. To the actual settler, in commuting a homestead or paying for a pre-emption, I would allow the privilege of using any scrip, warrant, or other

government pledge for payment of its indebtedness, in securing his title. I speak of the actual settler—to him I would extend every facility. While the pre-emption law exists, under which men may be hired to secure a tract of the public lands in a brief period, the *bona fides* should be ascertained by every test; and when ascertained, the honest pre-emptor should be placed on the same footing as the homestead settler. It is the principle or intent of the Pratt bill that I commend. I believe the words "actual settlement" should be guarded by restraining language, *e. g.*, by adding after settlement "for the exclusive purposes of cultivation or agriculture," the idea being limited to appropriating agricultural lands to "the making of homes." To effectuate this principle divide lands into classes, viz, agricultural, timber, coal, and mineral, the lands open to settlement by homestead being confined to the agricultural class.

If the idea be adopted that the public lands (agricultural lands of course are here meant) be held in trust for those who are willing to appropriate a quarter section and make a home, I would adhere to an uniform homestead system. If not, I would at once graft the principle on the land system, "That any man who has enjoyed the right under the homestead, pre-emption, or timber-culture act shall not make a claim under either of the other laws." He should be limited to the enjoyment of one right only; but an abandonment to government under either law for good cause shown, not compensated in any way by private party by purchase of improvements or for relinquishment should authorize the enjoyment of one grant, before exhaustion of right. In other words, "The settler should rather secure the privilege to perfect one grant, rather than one filing," provided always he has not relinquished the right acquired by a filing for a good or valuable consideration or inducement. Let me illustrate. A case has just occurred within my knowledge. In June last A took a homestead claim upon Vashon's Island, which, of course, necessitated the rowing of a boat between his said claim and the market for his produce, or where he obtained supplies. When he filed, it was understood between himself and a brother that the latter would take an adjoining claim. The brother found an eligible location on the mainland. A has a crippled left hand, has lost two fingers of the left hand, and the two others are stiff-jointed, so that he can pull but one oar, and therefore cannot alone row a boat. To make a living under such circumstances upon the island is impossible, for he cannot get back and forth, nor bring his produce to market. To add to his misfortunes, A's wife being advanced in pregnancy, in July a neighbor's wife died in child-bed, the death being attributed by A to the inability to communicate with the mainland and secure proper professional aid. She left to go to the house of a relative, and the death of her neighbor so impressed her that she cannot be persuaded to return to her husband's claim upon the island. He is forced to abandon such claim. He cannot live upon it. He has paid \$3 to the government, spent over three months' labor, and about all his money he brought with him, after paying his expenses to reach the country. He cannot take another homestead, although it will be conceded by all that he should be so allowed. He can now take under the pre-emption law. From this illustration, I desire to say: Let the party elect under which law he will hold, if the several systems are retained. Let him mature one right without he sells or disposes of his settlement for a valuable consideration or upon inducement of any kind; in other words, not a compulsory relinquishment. If he files and sells, his right is exhausted. If he files and for meritorious reasons without fault of his own he is compelled to relinquish to the government, let him file again, if he brings himself within the rule entitling himself to relief.

If the question be settled that the government can safely look to the timber, mineral and coal lands for its revenue, and open the agricultural lands for homestead, may I suggest I believe abundance will be derived from a proper system of sales of the former—either the timber itself or timber lands, and cash entry for mineral or coal lands. It ought to be the policy to invite capital to buy directly from the government at a proper valuation rather than force capitalists to employ intermediate parties to make pretense of entering such lands who have neither means nor intention to develop mines. The government is defrauded; parties are tempted to commit perjury, and the government besides really loses the value of the investment. All capitalists desire assured title, speedily confirmed to them. They would pay more for a tract presented at once to the government by two-fold than they often give to these intervening squatters who swear away the United States title. Thus under the present system perjury and fraud are invited, and others instead of the government realize the value of such lands. For example, if a coal company is willing to pay A \$5,000 for 160 acres of coal land for which A paid the government \$2,400, is there any sense in the government absolutely tempting A to commit perjury and to defraud it out of the \$2,400 which the capitalists would have paid the government quite as willingly if they could have purchased? Coal or mineral lands should be rated by a sworn and competent commissioner. One mine or vein may be worth thousands while the other is not worth hundreds. Private enterprise sells articles at their true value; all horses are not sold at the same figure. Private parties, railroad companies, realize upon lands according to their proportionate or true value. Lands worth \$100 per acre are not sold at the same price as lands that are worthless. Why should not the government,

when it has property to sell, do business on business principles? It would be but a trifling extra expense when timber lands, coal lands, or mineral lands are inspected and surveyed to grade them at what they are relatively worth, taking into consideration the extent of supply, quality of article, accessibility, &c., governing the affixing of value. Lands containing beds of true coal should command a much higher price than land containing veins of lignite—both are called coal lands. Is not such a truer test than proximity to a railroad? There are sections where a mine two or three miles from a railroad would cost more to be rendered accessible than other locations where the building of a railroad of twenty miles might be required to get a railroad or an outlet, and the latter could be built at less actual cost. If the government can hope to realize from its coal, mineral, and timber wealth, sold on a plan as herein suggested, I am in favor of saving agricultural lands exclusively for homesteading by actual settlement. Five years of actual residence and cultivation is evidence of bona fide and should earn the land. I am not sufficiently well-informed as to the proportion of the public domain respectively classed as timber, mineral, or coal. If it is as great as I have reason to believe, I favor an uniform homestead system. Abolish the pre-emption law; abolish every invention for divesting the government of its title, that unsettles the mind of a party who is willing to convert virgin land into homes and tempts him to be a speculator or a land proprietor rather than a settler.

In the settlement of controversies between claimants in the trial of contests, in fact in the awarding of a certificate of being entitled to patent, the register and receiver should be clothed with power to act judicially; clothed with jurisdiction, with power to issue the necessary process, summon and compel the attendance of witnesses, grant continuance, punish contempts, and adjust the payment of costs. A transcript of such judgment of costs should be authorized to be filed in a district court, and a rule to show cause, or some similar proceeding, become vitalized into a judgment whereby the aggrieved party could recover by execution. These judgments should be final for thirty or sixty days, within which, if no appeal was taken, they should become absolute as to the claim or right of the party against whom rendered. He has had his day and is concluded. If appealed from or exceptions taken within that time they would go up to the General Land Office for further action of the department. If not, they would be returned as papers sent forward for patent. In contested cases, if unappealed, I would have them affirmed, of course. The right of an action at law, or to maintain a suit in equity to cancel a patent obtained through fraud or misrepresentation, is not affected. The jurisdiction of the Land Department would of course be restricted to the question of surrender of the United States title to respective claimants. The nearer you can make the decision of the local office final, until reversed on appeal or exception, the wiser the policy. It would lead to more thorough trial, make less costly frequently put questions at rest, and in many ways prove beneficial.

#### AGRICULTURE.

1. In addition to the references to climate in the said centennial address, I send a valuable and reliable extract which answers this question as to Washington west of the Cascade Mountains. In this Territory, and certainly in Western Washington although there may be exceptional seasons, there is abundance of rain and water for purposes of irrigation.

2. The tables and statistics in the documents referred to answer this question as definitely as I am able with the data at hand.

3. All that is cultivable at all; of course I have no reference to the heavy timber lands.

4, 5, 6, 7, 8, 9, 10. In this region I know of no real attempt to supply a system of irrigation, indeed I have not heard of such a necessity. We have a law (which I enclose) for the construction of ditches, but that is for the purpose of drainage; but it serves both purposes, though really designed for the reclamation of swamp land.

11. I know of one or two suits as to water or riparian rights, or torts growing out of the diversion of streams, but no questions have arisen which really bear upon the subject upon which this query seeks information.

12. In this particular locality, the prairies of Pierce and Thurston Counties, gravelly and devoid of soil, there are large areas of land fit only for pasturage and hardly for that. They are appropriated usually for sheep, though other stock to a limited number range over them. I see no good reason for inducements to settlers to homestead this land, or to acquire quantities of it as pastoral land. The more they paid taxes the poorer they would be; some of it would require two acres for each sheep.

14. I do not believe it policy to put the agricultural lands in this Territory, or in any Territory for that matter, in market. I have given my reasons for believing that the government should reserve its agricultural lands for homes for actual settlers.

18. I think the growth of grass is increasing largely, that the prairie lands are improving because for years used as cattle ranges by which they have been manured, and that the burned timber openings are greatly multiplying forage for stock.

19. Cattle raisers as a rule do not fence. From the mildness of our winter, as the rule cattle and stock take care of themselves.

I have not investigated sufficiently to give any accurate information as to the remainder of the matters queried after under this head.

#### TIMBER.

1 and 2. To the two addresses inclosed I refer for general answers to these questions. I cannot reply accurately or in detail. A timber survey is required.

3. It is generally conceded that if our heavily timbered lands are denuded of their timber they will have become entirely valueless, not needed or available for purposes of agriculture. If this be true then the timber is the sole element of value. A tree suitable for lumber should bring more than one utilized for fuel, fencing, railroad ties, &c. Saw-logs command more than fire-wood. Therefore a system or tariff of stumpage could and should be arranged which would make our forest lands a source of revenue, and of necessity bring them under the immediate supervision of proper officers, and the terrible waste and destruction now going on would be in great measure checked if not entirely stayed. Lease with power to remove is only license to despoil. Sale, of land gives absolute right for the vendee to cut down, burn up and destroy not only what is upon the tract sold, but affords the opportunity to set the match which consume millions of timber and destroy whole areas of timber country. The saw-logs may be sold first; after they have been taken the remaining small timber may be sold for cordwood, ties, or other purposes. The sale should always be with the prohibition to use anything but an ax to fell a tree. Such a plan adopted would bring revenue to the government; it would save timber land for the present and future generations.

5. There is a vigorous and speedy growth. But the very speedy growth impairs the value of the timber for lumber manufacture. Our forest timber derives its value from its compactness, toughness, density; its long maturing in centuries. The second-growth for a generation only is admirable for fuel, serves for fencing and many purposes; but is valueless when compared to the old settler of thousands of years.

6. Forest fires arise from several causes. (1.) The reckless use of fire in the felling of trees, to peel its bark or saw it up for fire-wood. (2.) The burning after a clearing without care. (3.) Occasionally from a camp-fire. In our dry seasons, in one extensive forest fire, more timber is destroyed, more timber land devastated by scorching, deadening, and blackening the trees than is absolutely utilized. Prevention of the causes of fires as before suggested, creating the belief that the timber has a value, will do much to check this great evil. But if the fire starts, bountiful heaven, sending heavy rains, affords the only remedy.

7. Our saw-mills indirectly have been the inducement for removing the timber from the public lands. The large companies own vast areas of timber land throughout Western Washington, bought at \$1.25 per acre when currency was worth 40 cents on the dollar; at which time lands happened to be subject to cash entry. These companies teach the government its duty. They have kept these forests in their virgin condition. The logger's ax has not invaded their extended domain. In the mean time, for twenty years their own lands not trespassed upon except by fires, they have bought from loggers the timber which has been converted into the immense lumber manufacture of Puget Sound. Depredation from any other cause has been so trifling that it is unworthy of mention. The legislation necessary is for the government to assert its possessory right and guard what is left, and save the proceeds in the same manner similar to the one herein suggested.

8. The local custom is the establishment of logging camps in the heart of a densely-supplied timber section, staying there till every stick worth cutting down is converted into saw-logs. Sometimes camps are established and run by one of the large mills. Oftener, however, a logging camp is a private enterprise. Large booms of logs are collected, frequently as much as a million of feet in a single raft, and from two to three or four of these rafts are sent away from our logging camps in a year. These rafts are sold to the mills; the mill owners purchasing sending a steam-tug to tow them to the mill at which they are to be manufactured into lumber. Trespass upon government lands, or from lands belonging to the logger, or from tracts which the logger has purchased that standing timber, are the several ways that the right to cut timber is exercised or acquired. I have frequently drawn conveyances of the standing timber, together with a right of occupancy for a fixed term to cut and remove it. Sometimes the sale is unqualified, sometimes restricted to trees over a certain dimension. Sometimes the cedar is excepted. I state this thus perspicuously because it suggests business for a timber agent; it demonstrates that all the growing timber has a value which can be measured. I have known sales of the timber on a quarter section to be as high as \$600, payable \$1 out of the proceeds sale of rafts for every thousand sold to the mills. Is there any good reason why the government should not profit by this timber?

9. If as in the present case at Olympia, and for what I know at Vancouver (my

business with both offices has always been most satisfactory), I answer—yes! But as “whatever is worth doing at all is worth doing well,” the protection of the rights of the government in the timber of Puget Sound would justify the employment of officers for that special purpose. I would confer this appointment upon the local land office; giving also the authority to them to use a proper detective force—the inspector to rate the timber, make sales and collections, reporting to such officers and subject to their supervision and direction. Were the land office clothed with jurisdiction, i. e., as a court of first instance to adjust and determine complaints of depredations of timber it would prove a salutary system. I have often inquired in my own mind, what right has any one to seize timber without due process of law? By what authority are rafts exposed to sale without condemnation? It has always been the plan when seizures have been made to buy the rafts at the price they would allow them to bring rather than contend with the government as to the trespass by that officer acting in its name, but without warrant. Give to these land officers when acting as judges the inseparable incidents of “jurisdiction,” and turn over this matter to their control. They possess the records enabling profitable sales of timber; they should be invested with the power to guard the timber land and secure the government against trespass and waste.

*Testimony of E. C. Ferguson, Snohomist County, Washington.*

The questions to which the following answers are given, will be found on sheet facing page 1.

SNOHOMIST CITY, WASHINGTON, October 10, 1879.

*Public Land Commission, Washington, D. C. :*

GENTLEMEN: Having received your circular of interrogations, &c., I submit the following answers:

1. E. C. Ferguson, Snohomist, Snohomist County, Washington.
2. Nineteen years in the county; twenty-one years in the Territory.
3. Have acquired title to public lands under the pre-emption and homestead acts.
4. Have had considerable business with local land office in making applications for parties under the pre-emption and homestead acts, taking testimony of witnesses on final proof, &c.
5. On pre-emption (uncontested), except time of residence required by law (not less than six months and within thirty months), on filing declaratory statement; fees at land office, \$3; if made here, one to two dollars to party who does the business; on final proof, \$4 fees at land office; actual expense of pre-emptor to Olympia and back, \$15; testimony of witnesses, if taken here, \$3; if witnesses go to Olympia, same as pre-emptor; time necessary to make the trip to Olympia and back, five to six days. On homesteads, same, with the addition of the larger fees. Contested cases—cannot say.
6. Do not see the propriety of not allowing a party to file a second pre-emption declaratory statement when he has failed to make proof and payment on his first filing. Think it should also be allowed in homestead entry, for it often happens, in this part of the country, that a poor man takes up a claim and lives on it two years or more, and then, in case of pre-emption, has not the means to pay for the land, but if allowed to sell his improvements to some party and make another filing, the party purchasing would immediately file upon the land and the party selling would have something with which to commence upon another claim.
7. This county is principally a timber county. About the mouths of the rivers are some tide marshes which have to be diked to render them fit for cultivation. A very limited amount of prairie probably not to exceed a thousand acres in the whole county. This is a great county for grass, also for grain. The greater portion of the land is covered with fir timber suitable for lumber, the bottom lands along the streams are covered with spruce, cedar, maple, alder, cottonwood, vine, maple, &c., occasionally fir grows on the bottom lands. While the land is principally covered with timber, the soil is good, and when the timber is removed the land produces well grass, grain, fruits, and vegetables. The soil is A 1.
8. I think by general rule.
9. Do not know of any better system than the present.
10. Do not know of any better way than by pre-emption and homestead entry.

AGRICULTURE.

1. Climate mild; plenty of rain; fair length of seasons generally, but light fall of snow in winter. No irrigation needed. No frost here yet at this writing.
2. Rain from September to May generally, sometimes later in the fall; usually have

some rain up to 1st of July. I have never known the crops to suffer for want of rain; sometimes have a little too much.

3. No irrigation needed.

5. None.

6. Not wanted.

12. None, except such as are only partially cleared.

13. Not in this county.

14. No.

15. One acre. Am acquainted with some sections not so good. I think there are but few better.

16. Question rather vague; say 5 cows.

17. Cannot say. Country sparsely settled. And where settled not one-eighth of the land cleared up. Say, where a settler has 20 acres cleared, will average 10 head of cattle.

18. Increased.

19. No cattle raisers as a business.

21. Springs and streams from the mountains.

22. Say five.

23. No regular sheep pastures; only a few in the county.

27. None.

28. Yes; in many instances corners cannot be found.

#### TIMBER.

1. Mostly timber uplands, red, yellow, and white fir, cedar, hemlock, &c.; bottoms, spruce, cottonwood, maple, alder, cedar, and vine. Red and yellow fir and cedar used for lumber. Balance of timber not much used, yet some maple, alder, and spruce are used in the manufacture of furniture, also cottonwood for staves. Spruce is also manufactured into lumber.

2. None planted.

3. Think the lands should be disposed of only to actual settlers under the pre-emption and homestead laws; 160 acres, as at present. Do not think actual settlers should be limited to one filing only where they do not make proof and payment, because a party may make an entry in good faith and make valuable improvements thereon, but before he is ready to make final proof he may have a chance to sell his improvements to a party who has means to purchase but who does not desire to go further back and take up lands entirely unimproved. The first party, being acquainted with the country, will go further back and perhaps locate a better place than the one sold. I know of many instances of this kind, except where the party had first filed a pre-emption his next entry would have to be a homestead, and *vice versa*. As to the timber act of June 3, 1878, think it rather vague; do not think there is any portion of this county (except some of the mountainous part) that it ought to apply to, but I notice there are a large number of entries already made under the act. If parties are allowed to acquire title under this act our county (or the best part of it) will soon be in the hands of capitalists, and consequently the settlement of the county very much retarded. I think that form No. 2, "Testimony of witnesses" (under timber act), should be more explicit; say, after question 7 should be questions as to the nature and quality of the soil, its adaptation for cultivation when the timber is removed, &c., as it is a fact that much of our land is covered with desirable timber, and that its chief (or greatest) value at this time is the timber, and that the land is more valuable for agriculture after the timber is removed. Yet if capitalists are allowed to get hold of it in quantities (as they will if it can be located under the timber act), it may be a long time before the timber is removed and the land get into the hands of farmers; but if it can only be acquired under the pre-emption and homestead laws there will be a much greater settlement and improvement, and the actual settler will get the benefit of the timber, which will enable him to make greater improvements.

4. No.

5. There is a second growth of timber where it is not kept down by the settler; the same kind as originally stood on the ground. Think it would take at least 50 years for fir timber to acquire a size suitable for lumber.

6. Forest fires do not do much damage in this part of the country. Forest fires are principally confined to gravel ridges; these ridges extend along and near the sound shores, but in some portions of the Territory extend inland, although the indications are that at a time long ago a fire swept over a great portion of the country; also, at a later period, say within the last one hundred years, a fire swept over quite an extent of country in this county. So far as my observation goes, fires have been started by Indians generally. I have noticed that after a hard winter we have the most fires, and particularly so if the following summer is dry, which is generally the case when we have a winter with much snow. The timber being evergreen, the weight of the snow on the branches causes them to break and fall to the ground; in this way the ground

gets thickly covered with the branches, which dry out in the summer and furnish fuel for the fires. The fires, once well started, they run up the dry bark on the fir trees, and if the wind is blowing spread very rapidly. But outside of gravelly ridges there is generally so great a growth of underbrush and the forest so dense that it does not get dry enough for a fire to run. Nothing as to mode of prevention.

7 and 8. There has been a great deal of what we call timber stealing, that is, cutting timber on the public domain for saw-logs, &c. This timber is cut by parties in the logging business and sold to the mill companies on the sound, and by them manufactured into lumber, but the government is now taking steps to stop it, and from present indications, I think, with success.

9. Think they would with proper limits, &c.

As to mining, I have nothing to say; my experience is limited.

In speaking of the lands in this county, &c., I wish to be understood as to those portions on which there are settlements or liable to be. Now, our county on the east is bounded by the summit of the Cascades; as a matter of course, there is a portion of mountainous country, none of which is yet surveyed and probably will not be for some time to come; neither will it pay for some time to come to remove the timber from the mountain sides. As to the mountainous portion of the county, I make no answer or suggestions, but I think all laws in relation to the public domain should be so guarded if possible as to prevent capitalists from acquiring title to large tracts.

Respectfully,

E. C. FERGUSON.

---

*Testimony of John R. Goulter, county auditor and farmer, Oysterville, Wash.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. John R. Goulter, Oysterville, Wash.; county auditor and farmer.
2. Thirteen years.
3. Yes. I have bought some offered lands.
4. By being clerk of district court, and making out land papers for homestead and pre-emption settlers.
5. I never noticed any unreasonable delay.
6. I think timber lands ought to be offered at intervals, in limited quantities, to the highest bidder by sale or lease.
7. Agricultural and timber.
8. By a competent judge designating the different sections is the only sure way.
9. I do not understand the exact meaning of this question.
10. I think there is less jobbery and crooked ways by the homestead and pre-emption system than any other way I know of.

**AGRICULTURE.**

1. Mild climate and lots of rain in winter.
12. Very little.
15. Twenty, if they run on the natural range, without cutting any hay.
16. Fifty.
17. Very few.
18. Increased.
19. Some are fenced and some not.
20. Doubtful.
21. The clouds give plenty.
22. Five.
23. Neither, so far as I see.
24. Sheep eat too close for cattle.
25. The sheep take the dry and cattle the tide and marsh lands here.
26. About 2,500.
27. We want more land surveyed and the ten-mile floating grant of the North Pacific Railroad Company settled one way or the other.
28. Not but what might be reasonably expected.

**TIMBER.**

1. Nine-tenths spruce, hemlock, fir, cedar.
2. Plenty growing.
3. Leased or sold to the highest bidder in limited quantities, whenever needed for current consumption by the mills, but not sell any large quantity ahead of the requirements of the mill to create a monopoly.

4. No.
  5. Yes; principally alder, the second growth.
  6. A fool and a lucifer match; they have ruined millions of feet here; enlightening public opinion,
  7. Execute the present laws.
  8. Individuals cut and sell to mills.
  9. I think they would.
- I know nothing of mining.

---

*Testimony of W. H. Smallwood, register, and S. W. Brown, receiver, United States land office, Vancouver, Wash.*

The questions to which the following answers are given will be found on sheet facing page 1.

UNITED STATES LAND OFFICE,  
Vancouver, Wash., November 19, 1879.

*Public Land Commission, Washington, D. C.:*

GENTLEMEN: In reply to your circular in relation to public lands we have the honor to state that the copies sent by you have been referred to such persons in various portions of Vancouver land district as, in our judgment, are best qualified to answer intelligently the questions propounded by your Commission. As register and receiver of this district we deem the subject of your deliberations of sufficient importance to require from us a special report.

#### PRE-EMPTIONS.

1. As to pre-emptions, we would recommend that the pre-emption law, if retained upon the statute-book, be so amended as to prescribe, first, a definite amount or length of residence; and second, a somewhat more definite amount and character of cultivation and improvement; third, we would also recommend that the price of pre-emption lands within railroad limits be reduced to \$1.25 per acre.

#### HOMESTEADS.

2. As to homesteads, we would recommend that the homestead law be so amended that the mere act of entry may not exhaust the homestead right. We believe the rule in force on this subject is too rigid, and, in very many cases, works a great hardship to poor men. On this subject the opinion of Assistant Attorney-General Smith, in case of Bernard C. Killin, very well expresses our views. (See Copp's Land Laws, edition of 1875, p. 241.)

There is to-day a large class of persons in this country who, through ignorance or misfortune, have, under the rule now in force, forfeited the homestead right without being able to obtain a home. By a somewhat more liberal provision these men, the large majority of whom have acted in good faith toward the government, would be provided with homes, and the country would at the same time increase its power of agricultural development and add to the number of its industrious and patriotic citizens.

We would also recommend that the homestead act be so amended as to reduce the amount of fees and commissions required to be paid by the settler. It costs a poor man too much to take a homestead under the present law. At the same time the most rigid requirements should be enforced as to residence and cultivation.

We would further recommend that in cases of cancellation of homesteads, on proof of abandonment, some provision be made to protect the equitable rights of the party filing the complaint. The rules of practice require the party who initiates proceedings of this character to deposit a sufficient sum of money to defray all expenses incident to proof of abandonment; and yet he has no assurance that some one else, more "diligent" and better suited to watch the result, will not, at the very moment of cancellation, step in and make entry of the tract so canceled with a soldier's additional homestead right before he can possibly have an opportunity to know that the tract is vacant. Two or three cases of this kind have come under our observation, where the local officers were powerless to enforce a remedy in the interest of justice.

#### TIMBER-CULTURE ENTRIES.

3. We would recommend that this act be so amended as to specify distinctly whether residence is required of the claimant. The present law appears to be silent upon that subject; and with many the question of residence seems to be an open one. If the

requirements of the present law are strictly complied with we see no reason why a residence should be necessary. The evident object of the law is to promote the growth of timber on the prairie lands.

#### TIMBER DEPREDATIONS.

4. The greatest source of annoyance to the local land officers is found in the subject of timber depredations. We would recommend that this matter be placed entirely in the hands of special agents of the General Land Office. It is impossible to enforce the law against offenders unless the prosecuting officer can be personally present where the offense has been committed. This the register or receiver cannot do and at the same time attend to the primary duties of their offices.

#### PUBLIC SURVEYS.

5. We feel it to be our duty to call attention to the fact that on extending the public surveys discrimination appears to have been made hitherto against the most heavily timbered portions of this country. The rates of surveys should be so fixed that contractors will not prefer to do their work upon uninhabited prairies, while settlers upon timbered lands are required to wait for five, ten, or fifteen years (in one case, we are informed, seventeen years) for the survey of their lands before being permitted to make homestead entry, and then five years more before being allowed to make final proof. Certainly the prospect of such an experience will not do much to encourage settlement and agricultural development. In some cases there have been three or four surveys (during several years) of a township, each one finding settlers upon land which by a prior survey had been designated on the plat as "mountainous," "heavily timbered," "unfit for settlement and cultivation," &c.

#### LAND UNFIT FOR CULTIVATION OR FOR TIMBER.

6. We desire to call to notice the fact that a considerable portion of land along the banks of the Columbia River is destitute of valuable timber or mineral, unfit for cultivation, and at the same time valuable for fishing and commercial purposes. The settlers upon these lands are unable to enter them either as town sites or with such scrip as may be made available. Yet in many cases they have improved the lands by building houses, docks, &c., and have resided there in good faith for years, hoping some day to obtain in some way a title to the only homes they have in the world. In some cases it can be shown by competent testimony that upon certain tracts of this kind not one-half an acre can be found which can be cultivated. In one case it appears in evidence that a pre-emption claimant had carried soil from another tract in order to make a little garden on his claim (the entire surface of his claim being rock) to enable him to make final proof; yet in consequence of instructions from the General Land Office in a somewhat similar case, the local officers felt it to be their duty to disapprove of the proof offered, and therefore could not allow his final entry.

Some remedy ought, in justice, to be found for these settlers; though some of them have already abandoned their claims, having concluded that it would be impossible to make final proof without being able to show a reasonable amount of cultivation. (See Commissioner's letter of February 6, 1877, in case of Edward Miller, pre-emption, cash entry No. 1797, and John B. Nice, pre-emption, cash entry No. 1798.) In case of Edward Miller supplemental proof was submitted, showing that there was less than one acre fit for agricultural purposes on the entire tract. Yet pre-emptions being granted for agricultural purposes, the Commissioner of the General Land Office must necessarily hold as he does: that the amount of cultivation is insufficient under the law.

#### COMPENSATION OF REGISTER AND RECEIVER.

In recommending a reduction of homestead fees and commissions we would not be understood to favor a reduction of the aggregate compensation now provided for the register and receiver. Their duties and responsibilities are important and numerous; and in districts where the salary and commissions fall somewhat below the maximum standard the compensation is not in equitable proportion to that of officers who somewhat exceed the maximum.

The chief labor of a district land office consists not in the number of entries, but in its location with reference to the traveling and inquiring public. Some provision should be made to pay the register and receiver for the immense amount of correspondence imposed upon them, and the many annoyances to which they are constantly exposed by personal inquiries from those seeking information as to vacant public lands and the operation of the various laws in relation thereto. A considerable amount of additional labor has also been the result of the law allowing final proofs to be made

and entries applied for through certain officers of the county in which the land is situated. More than half the cases received through the mails from this source have to be returned for correction, and in some cases the papers are returned three or four times. Each case thus returned requires a letter of explanation. Yet the law, upon the whole, is rather a benefit to the settler at a distance, especially in this country, where rates of travel are unusually high.

At present the law allows only the registers and receivers of consolidated districts to charge for transcripts of records and other information furnished to individuals, who in turn generally derive more or less profit therefrom. Officers of the government should always stand ready to furnish the necessary information to the public, but those directly benefited by such information should pay a reasonable compensation therefor. Gratuitous labor and information are always in demand. In a land office they are staple articles, with which the market is never too well supplied. At least one-half the time of the land officers is taken up in waiting on and answering those who hesitate not "to ride a free horse to death." A fair compensation for such services would pay for the necessary outlay of clerical labor.

Very respectfully submitted,

W. H. SMALLWOOD, *Register*.  
S. B. BROWN, *Receiver*.

*Testimony of Frederic W. Perkins, dentist, Walker's Prairie, Stevens County, Washington.*

WALKER'S PRAIRIE, October 9, 1879.

1. Frederic W. Perkins, Walker's Prairie, Stevens County, Washington Territory; dentist.

2. About 20 years.

3. I have not.

4. By study and observation.

5. In uncontested cases about one year from the time of payment. In contested cases it depends on whether the case is decided by the local land office or an appeal taken, and then how far the appeal is allowed.

6. I think that the present land laws induce many men with elastic principles to come so near perjury for the purpose of getting more land than they should get, even with a liberal interpretation of the laws, that it is almost a premium on that crime. The pre-emption, homestead, and timber-culture acts I think give more land than was intended by the framers of the law. The timber-culture act (although, as I take it, it should not apply to any land in easy reach of timber) is made to apply in sections where, although there may be no timber on the actual section taken, they are so surrounded by timber (a scattering timber thereon) that it amounts to about the same thing at last—a stretching of the facts that in any other case would be actionable, but is passed over in this. The homestead act is, I think, lame and unsatisfactory, inasmuch as a homesteader does not have the same time to enter that the pre-emptor has, and in many cases loses his claim. For instance, I am a homesteader, poor, and far from the land office; I have no means of knowing that the survey is made and the plat recorded in the land office; some one who knows all these things waits until my time expires, and then pre-empt on me, and before I know anything I am either forced to litigate or leave my claim. I have known instances where this could occur, and men are more liable to this out in this part than almost any other.

The pre-emption laws are well enough, but in my opinion they, as well as all of the land laws, give too much margin. I would restrict all men to one quarter section; it is all that any one man can farm as it should be, and large farms do not open up a section as fast as small ones. This is in strictly agricultural districts. In timber I would restrict all purchasers to the same amount, to wit, one quarter section; in grazing sections to one section, provided they fenced it. I would make the fencing as necessary before getting a patent as the money.

I am of the opinion that 160 acres are enough for any farmer, if it is divided fairly between prairie and timber. I would give the homesteader the chance of getting 40 acres of timber for his own use in the same way that he gets his land; that is, giving any poor man who homesteads his 160 acres of farming land and also a 40-acre timber lot; this to the homesteader only. If any man has money to pre-empt, he can buy his timber.

7. The land in this county can be divided into four classes: agricultural, timber, mineral, and waste or grazing lands. That portion contained in Colville Valley is about divided into one-third good farming, one-third grazing, and one-third timber; south of the Spokane, one-half farming and one-half waste and grazing, with but *very little* timber. The lands that I call waste are rocky, sandy, and but little water in the fall

of the year; but still there are places along this belt where good grazing is had all the year. That part now given to Indian Moses, and being on the west side of the river Okinakane, is *almost all mineral*; copper, iron, silver, gold, tin, quicksilver, coal, lead, and black-lead are found here in paying quantities. Silver and gold are also found in Colville Valley; also great quantities of fine limestone, white, blue, and gray, with some indications of graphite. I think that the best way would be to survey all the farming lands, with the adjacent timber; then the other class of lands.

9. I have already given my views on this subject, and I would say again that 160 acres of land, well cultivated, is all that any man should get from the public domain as a gift, almost, from government. This, with a 40-acre wood lot, should satisfy any man not insane enough to try to get more than he can use.

#### AGRICULTURE.

1 and 2. The climate in this section is about the same as that of New England, with the exception of summer frosts, which make some of the tender vegetables uncertain in some localities. The rain falls principally in the spring and fall, with once in a while a day's rain in the summer, followed almost always by a frost. The snowfall is about 18 inches, and remains on the ground from two to four months. The lands do not require irrigation to raise grain, but sometimes gardens are benefited by it.

8. I think that all the grains that grow in the temperate zone can be raised here, and most of the hardy fruits, apples, &c. We find that the hillsides are not so liable to frosts as the *low hollows*.

Questions 9, 10, and 11 do not apply to this section.

12, 13. I think that fully two-thirds of this county is especially adapted to grazing, but for any man to get a homestead for grazing purposes the law would have to be changed, as he could not swear that he took the land to cultivate. I think that if any one was to have the right to homestead on grazing lands one section would not be any too much, for this reason: if land carries too many head of stock the wild grasses soon run out. A man should have sufficient range so that he can change his stock: and I would make it incumbent on all to fence their lands used for this purpose before getting a title.

14. I would give a certain time after the extension of the surveys (say two years, before giving the rights of private entry, and then only one section to one man.

15. About four beeves to the acre. I think this is the average of all bunch-grass counties.

16. About six head per annum.

17. Can't say.

18. Diminishing slowly.

19. Not the practice to fence. Cattle are fed during the winter in this section.

20. I think they would.

21. Streams and living springs.

22. About 12.

23. Run out; nothing left.

24. No.

25. Cattle and horse raisers do not want sheep near them. They cannot keep their stock on any range that sheep occupy.

26. I think about 15,000, in bands from 100 up to 3,000.

27. I can think of nothing further.

28. Sometimes the corners cannot be found, cattle having rubbed them down and the Indians having pulled them out.

#### TIMBER.

1. Large quantities pine, tamarack, fir, and cedar, maple, willow, and cottonwood on the streams.

2. There is no timber planted, fruit being all that has been planted.

3. The fact that a farmer can go on public lands and get all the timber necessary for his own use does not work well; they destroy more than they use, but not in proportion to the lumber cutter. I said before, and I say again, that the only way that I see is to give the homestead settler a 40-acre lot on the same terms as he gets his farm, but to him only. The pre-emptor should have the same right to pre-empt 40 acres of timber as he has to get his farm—that is, to pay for it; but no one should have the right, near farming land, of in any way getting more than 40 acres.

In the mountains, and in places where the farmer would not probably want timber a man should be enabled to get a quarter section for logging camps, &c., but they should pay for it before cutting a tree. I think that this would make them more careful and do as little damage to young and growing timber as possible, for every tree that they damage the loss would fall on themselves and not on the country at large. Man is more apt to look strictly after his own than that of others is one reason for

this. As to the price of timber lands, it would depend on the quantity and quality of the timber standing thereon, from \$1.25 to \$10 per acre; and I would make it a penal offense for any one to cut any timber on the public domain for speculation. The fine can be paid, but if imprisonment be added men would think twice before risking it. A man can afford to pay the fine, for he makes it from the timber, but cannot afford the disgrace of imprisonment.

5. The second growth is much the same as the one cleared of the timber. The Hudson Bay Company, when they repaired their post at Fort Colville, about sixty years since, dug a saw-pit, and in that pit now grows several pines that are from 6 inches to about 12 inches in diameter. The growth is slow.

6. Fires almost yearly and are very destructive, deadening vast spaces, and the timber is dying out fast in these places. The Indians are the cause of almost all of the fires, and I do not know any remedy but their removal.

7. I have already said that without the ownership there will always be more or less waste and destruction of timber. The waste of the actual settler does not amount to much; but saw-mills and wood-cutters, and now the ties necessary for the Northern Pacific Railroad, will destroy much timber. I think that for every timber tree cut about three are broken down and destroyed, and the only legislation that would reach the subject would be, first, ownership as before stated; second, imprisonment and fine, or both, for trespass on surveyed lands or those offered for sale.

Settlers going into a new country unsurveyed must get rails, house-logs and fire-wood somewhere, and they must be procured from the public domain. There is but little waste committed, as the trees cut are small and the refuse is used for fire-wood. I would recommend that if any change is made in the land laws, or whether there is or not, an act should pass Congress granting the homesteader the same rights given to the soldier—that is that the time they have lived on their lands prior to survey should count them; but that they should live six months on the land immediately preceding the issuing of the patent.

The pioneer is but the soldier after all; he pins his life on his arm and starts to open up an unknown country, and after all the trials and hardships of the frontier he gets no more advantage over those that come after the heat of the day is passed and everything is quiet and safe. The old residents of the Northwest think they should have some reward for the hardships they have endured in opening up the country in the face of such foes as the Indians of this section have proved themselves during the last two summers. I think that the least that should be accorded them would be that the time that they have lived on their lands should count, making them equal with the pre-emptor who comes in in time to reap the benefits of the quiet times that have come. Let the homesteader get title after the expiration of his time—that is, if he has been one year on his place before survey, then his title at the expiration of four years is five years or more, then in six months from the date of the survey, or rather six months from the date of his entry in the land office.

8. The custom in this section is to cut all you want, either for your own use or for sale; the latter without much regard to waste or the destruction of surrounding timber. The man cutting the timber owns it until paid for cutting, or it being delivered.

9. I think that there should be appointed some persons, not connected by business with any one cutting timber for speculation, and every one so cutting timber should be prosecuted according to any law enacted on the subject, he to report to the district land office, but not subject to removal except by the General Land Office, and then only for cause. He should receive enough pay to enable him to devote the time necessary to the care of the timber in his district, informing himself of the character of all timber lands, the quantity and quality of the same, and the approximate value of the timber growing thereon.

In regard to the mining laws I know but little; nothing from my own experience, and but little from any other source.

I would add a few words about land scrip. I think that the way that speculators grab up all the best lands works a hardship on true settlers that should be remedied. You doubtless have heard more on this subject than I could write.

I remain, &c.,

F. W. PERKINS.

---

*Testimony of D. W. Smith, attorney-at-law, Port Townsend, Wash.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. D. W. Smith, Port Townsend, Wash.; lawyer.

2. Seven years November 23, 1879.

3. I have; under homestead and pre-emption laws.

4. Making entries, final proofs, and practicing before district land office in contested entry.

5. From twelve to eighteen months after final proof; entry not contested. I was attorney for contestant in the case of Thomas Fleming vs. Gregory Bailer; contested pre-emption entry tried before district land office at Olympia, Wash., December, 1876, which was appealed to honorable Commissioner General Land Office, and has since never been heard from. Appeal was regular so far as heard from. Cause still pending before honorable Commissioner and undecided, as I am informed, from lack of clerical force (Parties will die soon and settle their rights elsewhere if government don't decide between them soon.) The expense is simply enormous to the settlers in Clallam, Jefferson Island, San Juan, Whatcom and Snohomish and parts of Kitsap Counties, on account of the great distance from land office—from 100 to 250 miles—and inconveniences of travel. It is difficult making a farm in this timbered country, and four out of every five settlers have to mortgage their claims to get money to pay the purchase price and expenses of proving up, which it takes them years to pay off. The government should either create a land office at Port Townsend for the convenience of these counties or lessen the price of the land when over a given distance from a land office, or furnish some other adequate offset to such great inequalities.

6. 1st. Yes. The law contemplates that a competent person shall have the benefit of both the homestead and pre-emption acts. Yet if he takes a homestead he is practically barred of the other by virtue of clause 2 of section 2260, Revised Statutes which forbids him from removing from his own land &c., unless he either perjures himself or makes a sham conveyance of his homestead to his mother-in-law for instance. The clause is inconsistent with the letter and spirit of the two laws, misleads settlers as to their rights, teaches them cunning to evade it, and ought to be repealed upon general principles.

2. That the "act to amend section 2291 of the Revised Statutes in relation to proof required in homestead entries," approved March 3, 1877, should extend to cases of final proof under the pre-emption law also. There is no reason whatever why applicants for final proof under one law should be compelled to go in person to the district (or local) land office any more than under the other, and it is a great injustice.

3. The act entitled "An act to grant additional rights to homestead settlers on public lands within railroad limits," approved March 3, 1879, is certainly an abortion. It was evidently the intention to give those who had been restricted to 80 acres an additional 80 acres, to make 160 acres, but the act, by limiting the settler to land "adjoining the land embraced in his original entry," substantially defeats its own object for more than half of the settlers whom the act was intended to relieve cannot find land adjoining their original entry, and to relinquish their original 80 acres, with the years of improvements they have placed upon it, would be a greater loss than the additional 80 acres (taking 160 in another place) would be a gain. If it is right to give such settler 80 acres more, they ought to have the right to take it wherever they can find it whether adjoining their original 80 acres or not. That act was certainly of premature birth, and ought to be changed to operate equally on all settlers alike.

4. Section 2261, Revised Statutes, prohibits the second filing of a declaratory statement by any pre-emptor, &c. This is a great hardship upon thousands of honest citizens, who may be found in all parts of the Western States and Territories, who have by this technical provision lost their right of pre-emption forever, unless Congress will fit to amend the law. There is not an honest settler in the West who will not condemn it. The filing should be limited to twice, not once. It operates harder upon young men than any other class, who, through lack of forethought, and with undue haste, file declaratory statements upon a tract of land which may prove unproductive or worthless, and not worth the price, and they lose it and their right because they cannot file again. Thousands, again, who have filed declaratory statements in good faith, by reverse of circumstances become obliged to let the land and their right go. Now, as the fee which the pre-emptor pays upon filing declaratory statements, to w. l. \$3, amply pays for all labor in canceling the land he files for, &c., &c.; and as there can be no good reason for not allowing a second filing, except the fact that it would give the land officers a little more trouble (which they are amply paid for by said fee) the law ought to be so changed as to allow a second filing. The party who filed the second time would, as a rule, stick to it, and both government and settler would be better off. Should the law be changed as herein indicated, it would be necessary for the pre-emptor to make oath, at some stage of the proceeding, as to whether or not he had previously, at any time or place, filed a declaratory statement for the same or any other tract of land, and that he had never had the benefit of the pre-emption law.

5. The "act to provide additional regulations for homestead and pre-emption entries of public lands," approved March 3, 1879, ought to be repealed, as it amounts to nothing, and never will, except to burden the settler with more expenses.

6. The act of March 3, 1875, giving Indians who have abandoned their tribal relations, &c., the right to homestead the same as white men may be all right applied to some of the tribes in the older States who have been under the influences of civilization.

ion for half a century or so, but it is wrong as applied to the "Siwash" on this coast, for the reason, which experience fully confirms, that it is an impossibility for *any* Indian living with or in the vicinity of his tribe to become what the law contemplates he shall be to come within its provisions inside of one generation. Nor is this principle of progression any more true as regards "poor Lo" than it is as regards any other race. It has taken the "noble white race" from four to six thousand years to reach his present state of perfection in civilized life, as we term it, and yet Congress expects the Indian, who stands where we stood six thousand years ago, to leap up by a single declaration in a day, hour, or minute to our standard. But it seems they do accomplish what it took us so long to do in a shorter time, as the annexed advertisement will show. And herein the force of my objection may be most appreciated. The fact is the Indian gets the land, while he remains an Indian still, and the government and its honest citizens are defrauded. The Indians who have taken the homesteads, as shown by these advertisements, are no more to be compared to a white settler in point of industry than a drone is to the working bee. The object of the government was to encourage them to labor like its own people and live by honest toil, which is laudable; but this should be done in a manner not injurious to the government or other settlers, and it can be so done by giving them from 10 to 20 acres instead of 160. Ten acres is more than any of them will singly ever cultivate.

7th. It is agricultural, pastoral, timber, and mineral.

8th. If I understand the question, the rules which must govern the classification and disposition of the lands in Western Washington must vary according to the character of the lands; thus the timber lands, I mean good timber, what is termed here a "good logging claim," is not regarded as good for agricultural on account of poor soil, but time may explode this belief. At all events, it is valuable now chiefly for its timber, and should be disposed of similarly as at present under existing laws. Where minerals are usually found, up in the recesses of the mountains, the land is apparently useless except for the minerals.

9th. I know nothing about it.

10th. I think the main principles involved in the present homestead, pre-emption, and timber-culture laws are right and cannot be improved upon. There are some defects which need remedying, and I have suggested a few of them, but the laws in the main ought to stand. Besides, the masses have become familiar with them.

#### AGRICULTURE.

1. Our climate is very mild the year round; not very hot in summer, and so warm in winter that many varieties of flowers bloom outdoors all winter. It is seldom that the mercury gets down to zero, and some winters we have no snow at all. We have no seasons—summer and winter. The winters are wet, the summers dry, yet neither wet or dry as to interfere with raising abundant crops or following any kind of vocation except for a day or two at a time. The dry season or summer begins about May 1 and lasts until about October 1, but sufficient rain falls for all purposes. No irrigation required here.

12. Very small proportion.

13. No, not different materially from the present laws

14. No.

21. Mountain streams and springs.

22. Yes, it is almost impossible to find them.

#### TIMBER.

1. All timber nearly; best kind for lumber, furniture, ship-building, &c. Fir, spruce, cedar, maple, cottonwood, &c.

3. Sale where it is strictly a logging claim, price \$10 per acre in tracts to one individual of from 40 to 320 acres. Timber land is so cheap under present system that large corporations have and now are gobbling up all the best timber lands in the Territory, which will prove oppressive by and by.

4. I would, if practicable, as thousands of acres of land are fit only for the fire-wood upon it, price \$2.50 per acre 160 acres or less.

5. There is a second growth, slow, same as original forest; would not amount to anything in size for several generations.

6. Fires occur, but are generally not very destructive on account of the evergreen nature of the forests and moist climate. Make it a crime.

7. Logs, ties, piles, &c., are cut a great deal on the public lands, I am informed. I think farmers, miners, or any other local industry should be permitted to go upon any public lands for materials for repairs or building and the like, but not allowed to take any for purposes of sale or speculation. Make it a crime.

9. I think there is no way to prevent unlawful spoliation of timber except by the

enactment of suitable laws for its sale, and then keeping a secret agent of the government employed to prosecute any who take timber unlawfully, and seize what they have taken, tools, &c.

D. W. SMITH.

*Testimony of Robert G. Stuart, receiver of public moneys from land sales at Olympia, Wash.*

OLYMPIA, WASH., November 14, 1879.

*United States Land Commission, Washington, D. C. :*

GENTLEMEN: My name is Robert G. Stuart, receiver of public moneys for the district of lands subject to sale at Olympia, Wash. I have lived on the Pacific coast over twenty-nine years, in the Territory of Washington eighteen years, and in this land district eleven years, during eight years of which I have been receiver, &c.

I never acquired title to lands from the United States except through direct purchase, but have improved wild lands both in the State of California and in this Territory.

All homestead claimants contend that they pay in expenses more than the value of lands they acquire, while pre-emptors say that they have to incur the same expense and then pay for the land afterward, frequently a double price to pay for roads that are never built; and I think their complaint is well founded.

The only radical change I would recommend in the present laws would be the abolition of all demoralizing oaths and testimony, which are expensive to the settler and but little protection to the government. Instead of this *have a government inspector* to make report from an actual view and inspection of the premises, confining the whole cost, first and last, within \$30 to the settler on 160 acres of land.

Have no forced and expensive attendance at the district land office, but let the claimant send in his application by mail, stating among other things that he is a native-born citizen of the United States, or had declared his intention to become such, or was naturalized, &c., and had never before had the benefit of the homestead laws.

Accompanying this should be proof of citizenship by affidavit of the native-born as to the county and State of his birth, attested by the oaths of two of his neighbors that they believe him to be native-born, and in other cases by the record evidence.

Respectfully, your obedient servant,

ROBERT G. STUART.

*Testimony of John A. Tennant, farmer and civil engineer, Ferndale, Wash.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. John A. Tennant, Ferndale, Wash.; farmer; by profession, civil engineer.
2. Twenty-two years.
3. Have acquired land under the pre-emption law, and have filed on land under the "homestead act."
4. Have been county judge, and as such filed homestead notifications, taken final proofs, and done a general business as agent for parties wishing to obtain land.
5. Under the pre-emption law, those who make *actual settlement* for the purpose of having a permanent home, avail themselves of the extent of time allowed by law (to wit, thirty months) before making final proof and payment. Those who settle for the purpose of simply obtaining a title either to sell, or perhaps at some future time live upon the land, make their proof and payment at the end of six months. We get our patents back from Washington in from six months to one year and a half. Under the "homestead act" a majority avail themselves of all the time allowed by law. Expense for a pre-emption, \$50, besides price of land; expense of homestead, \$75. These are in uncontested cases; in contested, so many factors enter I cannot even give a *good guess*.
6. Yes; in the "homestead act" the provision "that absence for more than six months at any one time," &c., shall be promptly repealed, parties (and they are numerous) avail themselves of this, putting the construction on it that a visit once in six months is all that is needed, and thus hold the land to the detriment of actual settlers. One case in point: A man holds a homestead in my immediate neighborhood who resides with his family in a town one hundred miles away; has never had all his family on the place at any one time; has never taken his household goods there; has no furniture in his house; has not cultivated one rod of land; but, punctually, once in six months comes here, gets his supper at the nearest neighbor's, stays on his place all night, and leaves at daylight in the morning, to return again in six months, and says he has not abandoned his claim for six months. This may be an extreme case, but will show you the working of that clause in the law. Let this be stricken out, and make the residence and cultivation continuous.
7. Generally level, being the valleys of several rivers and the deltas at their mouths. As we go back from tide-water the country becomes broken, and soon the foot-hills of the Cascade Mountains appear. This is true generally of all of "Western Washington" land, mostly timber. About the only open or prairie land is the "tide flats or marshes" at the mouths of the rivers. These are being *diked*, and are highly productive. Timber, fir, cedar, spruce, hemlock, cottonwood, maple, alder, and birch along streams and on *bottoms*.
8. To fix the character of classes of land and mode or price of surveying must be done by geographical divisions; no general rule in my opinion will answer; have had experience in public land surveys, for instance, in Walla Walla County, land reported by the first survey as second and third rate, now (without irrigation) thirty to forty bushels of wheat per acre.
9. I know of nothing better than the system now in use. It is economical, easily done, and sufficiently accurate for all practical purposes. The geodetic is doubtless more correct and for open prairie country practicable, but for the heavily timbered western coast utterly impracticable; am a surveyor by profession.

10. I consider the present land laws *very good* with the suggestion before made in reference to striking out clause "*six months*" in "homestead act."

#### AGRICULTURE.

1. Very temperate and even; rainfall rather excessive; but two seasons, wet and dry, in about the proportion of four dry to eight wet; some winters no snow, occasionally 8 to 10 inches, which remains no great length of time; no need of irrigation.

2. Rain falls from October to May, and some in all months.

The remaining questions under agriculture do not apply to my vicinity, and need not be noticed by me.

#### TIMBER.

1. *All timber.*

2. None; no need.

3. By sale. One quarter section or less quantity to each applicant, at not less than \$5 per acre, and purchase made after thirty days' notice, and on the oath of applicant that he has not had the benefit of the act, does not own 160 acres of land, and that it is not made for the use of any other persons; to prevent companies from controlling the business and allowing laboring-men to own timber land and to profit by the sale of his timber. The price may seem high, but these lands are very valuable; many acres that will cut 100,000 feet of lumber.

4. By all means into at least three grades, and prices \$5, \$4, and \$3 respectively.

5. Always a second growth of same timber as formerly grew; the growth very rapid, but from the newness of the country cannot tell the length of time necessary to make timber of size fit for lumber.

6. Forest fires are very prevalent, and originate usually from the use of fire in clearing land and cutting roads. One a few years ago swept over hundreds of sections. They are very destructive; great tracts are left with nothing but the burnt and charred remains of once noble forests. I know of no mode of prevention. Occasionally we have a dry season, and from the resinous nature of the timber when a fire starts it burns with unparalleled fierceness.

7. There have been some prosecutions and convictions for cutting timber in this county, but I am unacquainted with the amounts or extent of the trespassing.

8. If a man wishes timber for use and does not happen to have on his own land just what he wants, and he finds what he wants on public land, he just takes it; and the ownership is by custom securely vested in the one who fells.

9. In the local land office by all means.

#### LODE CLAIMS.

There is no mineral here mined except coal; and as far as my knowledge extends, titles were obtained prior to the enactment of the mining laws.

#### PLACER CLAIMS.

None in this part of the country.

Respectfully submitted,

JOHN A. TENNANT.

#### *Testimony of Wyoming Stock Growers' Association, of Wyoming Territory.*

Hon. J. A. WILLIAMSON,

*Chairman Public Land Commission, Washington, D. C.:*

DEAR SIR: In accordance with your request, the following notice was published by the executive committee of the Wyoming Stock Grower's Association:

#### NOTICE.

Notice is hereby given that a meeting of the Wyoming Stock Growers' Association will be held in Cheyenne, at 10 o'clock a. m., Tuesday, November 18. General Williamson, Commissioner of the General Land Office at Washington, has left with the secretary a series of questions to which he invites the serious consideration of our stock owners. These questions refer to the permanent disposal, by sale or otherwise, of all United States grazing lands in this vicinity. It is necessary that our reply should reach the Congressional Public Lands Committee at Washington before December 1. The subject is important, and a full attendance of representatives from neighboring associations and of our own is earnestly requested.

THOS. STURGIS,

*Secretary Wyoming Stock Growers' Association.*

Pursuant to this notice, the association met at the city hall in Cheyenne, Wyo., at the day and hour mentioned. The session continued throughout the day and through the forenoon of Wednesday, the day following.

The attendance was large, and included, besides resident stock growers of Wyoming, representative men from Western Nebraska and Northern Colorado. It was further increased by the attendance of the members of both houses of the Wyoming legislature, many of whom participated in the debate.

The object of the visit of your Commission was fully explained to the meeting, and the suggestions made by the Commission as to the method proper to be adopted in disposal of the United States grazing lands were fully discussed.

That the sense of the association might be known unmistakably, the four resolutions that follow were read in numerical order by the secretary. Each was then separately submitted to discussion and amendments invited, when the general plan was approved but details objected to.

#### RESOLUTION NO. 1.

*Resolved*, That in our judgment the best methods for disposing of the United States grazing lands throughout Wyoming is as follows: That a cash valuation of five cents per acre be placed on all lands without reference to their character or situation. That free entry be permitted in amounts of not less than 160 acres, taken by legal subdivision, and to as large an amount as the purchaser desires, limited as below by the right of other claimants; that one year from the 1st of January next, following the passage and going into operation of this act, be allowed to all occupants of ranges in which to purchase; that is between mutual occupants of one range who cannot agree upon the proportion to be entered by each. The register and receiver of the United States local land office shall decide, basing their decision on the cattle taxed to each, and so, *pro rata*, the amount of land to each; that after the expiration of one year the land may be subject to entry by any one.

This resolution was discussed by a large number. It received in its general features the support of three gentlemen, but the preponderance of the debate was strongly opposed to it. It was lost.

Vote: Three in favor, remainder of association against.

Resolution No. 2 was then offered:

*Resolved*, That all the lands, without reference to the character or situation, be offered for cash entry in any amounts desired by the purchaser, but not less than 160 acres, taken by legal subdivision, at \$1.25 per acre, this price to be maintained for one year from the 1st day of January after the going into operation of this act; at the end of that year the price on all unsold lands to be lowered to \$1 per acre; at the end of two years from the time of going into operation of the act it be further lowered to 90 cents; at the end of three years to 80 cents, and so on decreasing 10 cents per annum until the figure of 10 cents is reached. The year following it shall be reduced to 5 cents. One year from the going into operation of this act shall be allowed to actual occupants to purchase after each reduction in value. Conflicting claims between actual occupants to be adjusted by the register and receiver of the United States local land office in proportion to cattle taxed to each party."

This was debated, and lost by a unanimous vote.

Resolution No. 3 was then offered:

*Resolved*, That the United States Government lease the said lands in tracts, by legal subdivision, for the term of twenty years, at the rate of one-half cent per acre per annum, which we held to be 10 per cent. on the value of the land, for grazing purposes; that the amounts of lands so leased be in amounts as desired by renter, subject only to conflicting claims of a joint occupant, in which case decision shall be made by the register and receiver of the United States local land office on the basis of the number of cattle taxed to each applicant the preceding year; that at the expiration of any lease or during its continuance the renter may, at his option, buy the land so leased to him at 5 cents per acre cash, but should he not so buy on or before the expiration of his lease the said land shall be open to entry by any one at said price of 5 cents per acre when the lease shall have expired."

This was debated and lost by a unanimous vote.

Resolution No. 4 was then offered.

*Resolved*, That in our judgment the interests of stock owners would be best subserved by the continuance of the present system, which permits only the securing of title to small tracts of land; first, because we believe the system of cash entry and gradation, and to a less extent that of leasing, is opposed to our theory of government in that it enables individuals to acquire the monopoly and control of immense tracts of land, and concentrates the business in the hands of a few men. It will work great hardships to the owners of small herds, who will be unable to buy their range and must eventually leave the business; second, that we believe the people of the United States at large are now greatly benefited by the distribution of the stock business through hands of many small owners, and by their consequent prosperity, than by its absorp-

tion in the hands of a few, and that the country will gain more by such widely spread industry than it can from the sums that may be realized from the sales of these lands: third, that in our opinion the question of whether grass will not disappear from these ranges with constant feeding is yet unsettled, and that the stock business will not warrant the investment of so large a per cent. of capital as one-sixth in what may in a few years be barren and worthless property; fourth, that we believe the practice of confining cattle within any positive and impossible limits, however large, unwise, and dangerous from the severe and destructive storms, and the consequent necessity that cattle should drift very widely at such times for food and shelter, and we think such a risk would not be compensated by any or all the benefits derived from the exclusive use of the ranges purchased; fifth, that a usually fair observance of each other's rights has been the rule among ranchmen and owners of stock, and that thus far self-interest has proved a safeguard against the heavy stocking of the range, and that we would rather trust for maintaining our rights free from encroachments to the community of interests and the sense of equity that is the rule here than to see a system adopted that must excite serious quarrels between occupants of ranges, and a bitter feeling of injustice among the best stockmen, who, unable to buy their lands, will see themselves in time deprived of their business, and be obliged to sell and seek other employment."

Debate followed, expressing in various forms approval of this resolution, and it was adopted by a unanimous vote.

After further discussion the following was added:

"*Resolved*, That while the unanimous sense of this association is opposed to any legislation that seeks to change the present land system of the United States, still, should such legislation be contemplated by Congress, it must, in order to meet the peculiar nature of this country and the character of the cattle business, combine the following.

"A price not exceeding 5 cents per acre.

"A term of years for payment of the same.

"Privilege of purchase limited exclusively to actual occupants of the land."

Upon motion, the secretary was instructed to add to the fourth resolution (which had received the approval of the association) an explanation in greater detail of the reasons for which the members opposed any change in the method of disposing of these lands. Said explanation is attached hereto in a separate paper.

The executive committee were directed by the association to forward the result of their meeting to your committee; and we hereby, with respect, submit the same, requesting that you give it due weight in your deliberations and incorporate it in your report as the views of the stock owners of these portions of Wyoming, Colorado, and Nebraska.

J. M. CAREY,  
E. NAGLE,  
THOS. STURGIS,

*Executive Committee Wyoming Stock Growers' Association.*

CHEYENNE, WYO., November 22, 1879.

*Memorandum of reasons for which this association disapproves of any change in the present United States land system.*

In addition to the reasons assigned in the accompanying resolution, No. 4, we offer the following:

1. That the Territory is young, its settlement covering but ten years; that the cattle business is in its infancy, a large majority of the herds having more or less indebtedness upon them; that to clear this off and acquire a surplus for investment in land must be a work of time; that to open the lands they graze over to general entry at the end of a year would injure them greatly; that under the present system our population is rapidly increasing, because owners of small herds find grazing facilities, and that under a changed system, permitting entry of large tracts, this increase would cease, and population might even diminish.

2. That the owners of these lands would be few in number to the voters of each county, and that strong reason exists to think that the lands would be exorbitantly taxed.

3. That the lands must be fenced in large tracts to permit the necessary traveling by cattle during storms, and that the necessity for keeping open broad county roads through them would limit their size and add greatly to cost of fencing.

4. That the danger of extensive burning of the ranges is a very serious one; it has occurred widely this year. Under a system of ownership of large tracts the danger of incendiarism from parties believing themselves injured, or for any other reason, less, would be greatly increased, and cannot be guarded against; that now we can allow our stock to drift by common consent onto unburnt ranges. Under a system of ownership we could only do so by consent of owner, which might be refused, in which case total loss would result.

5. That on calculation it appears that even at the low price of 5 cents per acre for the land, added to cost of fencing, which in a treeless country must be done with

wire, the investment in real estate, apart from annual outlay in repairs of fences and taxes, would be from one-fifth to one-sixth of the capital invested in the stock ranging over said area; and that in our judgment the cattle business would not warrant such an investment and could not be profitably pursued if such purchase were necessary.

6. That under any system permitting the cash entry of large bodies of land much would pass into the hands of stock companies or associations, on account of the inability of present occupants to purchase. Such companies or associations would be represented here by a single or but a few persons; and the results, instead of adding to the permanent wealth of the Territory, would be to a great extent carried out of it.

THOS. STURGIS,  
Secretary.

CHEYENNE, WYO.,  
November 15, 1879.

To the Public Land Commission, Washington, D. C.:

GENTLEMEN: In answer to your interrogatories, as per your circular of blank date, I have to reply as follows, viz:

1. In answer to question 1 in the first subdivision: My name is John F. Coad. I reside in the city of Cheyenne, Wyo. My occupation is that of stock-growing, and my stock range is situated in Cheyenne County, in the State of Nebraska.

2. Eight years I have been growing cattle in the same locality.

3. Have desired to do so, but found it impracticable under existing laws in quantities and at prices which would justify me in so doing for grazing purposes.

4. The practical workings of the public-land laws have not been good in this locality, for the reason that we have no agricultural lands worth mentioning, and under existing laws a citizen can only obtain title to a very small quantity of land for grazing purposes; which might be sufficient for agricultural, but utterly useless for grazing purposes.

5. In my opinion the public-land laws are not adapted to the wants of our people, who inhabit a semi-desert country, suitable only for grazing purposes, where it requires 30 acres of land to support one head of cattle. A law permitting actual settlers to pre-empt from one to three townships of land at low prices, say 10 cents per acre, or leasing said lands to actual settlers for a term of ten or fifteen years at half a cent per acre, would be beneficial alike to the citizen and the government.

6. Our section of country (Cheyenne, Nebr.) is undulating, rolling, sandy land—all grazing; no timbered or mineral lands.

7. By classifying the lands as grazing, timber, mineral, coal, &c.

8. For grazing. lands subdivide the country into large tracts, giving to each tract a frontage on or across some stream of living water, and extending the tract back half way to the next stream, river, or water supply, so as to include all the lands in some one of the several subdivisions of the entire country. This would necessarily make the subdivisions unequal in quantity, but equally well adapted for the only uses for which nature has designed them, viz, grazing.

9. I only suggest as to grazing lands. I have no interest in any other kind and do not pretend to be well informed in reference to them. I am of the opinion that it would be advantageous to both the government and the actual settler if the government would by pre-emption sell to actual settlers from 1 to 4 townships of land each at from 10 to 12 cents per acre, or lease the same land to actual settlers in like quantities for a term of ten years at from one-half to three-fourths of a cent per acre. The quantity of land so to be sold or leased to be restricted to the individual in amount in proportion to the number of cattle, horses, or sheep he may have or own which he proposes to graze upon the public domain; and in estimating the amount of land necessary for the raising and sustenance of one head of cattle, I would place the amount at from 20 to 30 acres, the quantity of grass on a given acre varying very much within short distances.

Under your subdivision "agriculture," my reply to your questions are as follows, viz:

1. Our climate is dry and cool in summer and dry and cold in winter. Have little or no rain from 15th of June to 15th of November, and then light snowfalls, with an occasional heavy snow storm, until about the first of the following May.

2. From May 1 to June 15, in light showers; no other rain worth mentioning.

3. None.
  4. One hundredth; not more for the want of water supply.
  5. No attention is paid to agriculture; no crops of any kind are raised. There is no timber suitable for fencing with that material and no effort made to raise crops of any kind.
  6. Do not know.
  7. North Platte River, which contains a good supply of water, but it is impracticable and would not pay 6 per cent. interest per annum on the investment required to divert the water from its channel and carry it on to the lands sought to be irrigated.
  8. Knowledge limited; observation none; experience none.
  9. Have no knowledge of the working of ditches; have none in my section of the country.
  10. The water has not been taken up or appropriated by any person or persons.
  11. Have no conflicts about water rights.
  12. About ninety-nine one-hundredths.
  13. I can see no objection to both the homestead and pre-emption laws being extended to the grazing lands with the changes I have named as to quantity and price for pre-emption and a like quantity for homestead. See my answer 10 under first subdivision.
  14. In my judgment it would be advisable for the government to put these lands in market to actual *settlers only* as homestead or pre-emption claimants as before mentioned. Were it otherwise the large capitalists of our country would soon own all or most of our winter-grazing lands and compel those persons actually engaged in stock-growing or desirous of embarking in that line of industry to purchase or rent from the speculator.
  15. From 20 to 30 acres, the grass being much better in some localities than others in the same section or township.
  16. I do not know.
  17. About 32.
  18. Diminished.
  19. As a general thing they do not. I have fenced in about 100,000 acres and have found that it works well. Have tested the system for three years.
  20. It would.
  21. The North Platte River.
  22. Do not know; we have no sheep in our immediate neighborhood.
  23. It has diminished very much.
  24. Cattle will not graze on lands pastured by sheep at the same time.
  25. I have heard of controversies between cattle and sheep growers but know nothing myself about such matters.
  26. We have about 150,000 head of cattle and about 500 head of sheep.
  27. See my answers hereinbefore given on same subject.
  28. There is little trouble, but not a large amount.
- We have no timber worth mentioning in our county, and no coal or mineral lands whatever.

I am, gentlemen, very respectfully, yours truly,

JOHN F. COAD.

*Testimony of Stephen W. Downey, Delegate in Congress, attorney and counselor at law.*

LARAMIE CITY, WYO., November 12, 1878.

HON. THOMAS DONALDSON, *Public Land Commissioner, Washington, D. C.:*

DEAR SIR: Your letter of September 16, transmitting copies of circular for distribution, and containing a request for me to communicate my views upon the matter to which the circular relates, was duly received. I have made the distribution, as requested, and have the honor to submit below my views upon the subjects involved, making your questions the basis.

#### PRELIMINARY QUESTIONS.

1. Stephen W. Downey, attorney and counselor at law, Laramie City, Wyo. Delegate in Congress from Wyoming.
2. Ten and a half years.
3. I have made filing under the desert-land act, and application for patent to several mineral claims which are still pending.
4. I have made a large number of filings and procured a great number of titles under the various acts of Congress for clients; have been employed as counsel in contest cases, and have on file in my office the records of a large portion of the surveys of public lands which have been made by United States deputy surveyors in Wyoming.

5. In uncontested cases, the time, exclusive of duration of settlement before patent required by law, is short. The expenses, including attorney's fees and cost of survey, but excluding land office fees and government price of land, are about \$30. In contested cases, the additional costs range from \$100 to \$1,000 and additional delay is from one to five years.

6. I have observed but few. I will speak of one. Land office officials require final proof of locators to be made and authenticated at county seat of the county within which, or at the land office of the land district within which, the land is situated. This requirement frequently puts settlers to considerable trouble and expense: *e. g.* many settlers proceed from the southern part of Wyoming to the northern part of Colorado. The county towns in the southern part of this Territory are the convenient and natural places for the business transactions of such settlers. Through these towns they must pass and travel a long distance to reach the county seat of their county on the plains of Colorado, east of the mountains, and still further to reach the land office of their district at Central City, Colo. In my opinion the defect in the practical operation of the laws necessitating such inconvenience and expense could be remedied without any corresponding detriment to the service by a rule allowing settlers to make proof at the most convenient county seat, authenticating the same by signature and seal of the clerk of the district court.

7. Lofty altitude, the Laramie Plains and Platte Valley being 6,000 or 8,000 feet above sea level. The surface is divided into plains, rolling lands, and lofty mountains. Spruce, pine, fir, and aspen forests abound in the mountainous districts. Belts of valley and plain lands, from two to five miles in width along the principal streams, are irrigable therefrom, and it is believed that many remoter portions are irrigable by means of wells, with windmills to raise the water to the surface. The mineral resources of Wyoming are but little developed, though many mineral districts are known to exist, some of which are extensive and important. The coal and iron fields of Wyoming are immense, the former being lignite, and in veins ranging from a few inches to twenty-seven feet in thickness, the latter being found in various forms of ore, among which are prominent hematite of very superior quality, said to be suitable for the manufacture of the best steel, and extensively used for metallic paint, and mountains of almost pure metallic iron. There are several large petroleum fields. There are also lakes containing inexhaustible supplies of soda, both in the form of carbonate of soda in solution (these being about sixty miles northward of Rawlins) and sulphate of soda crystallized, these being about fifteen miles southwesterly from Laramie City, in townships 14 and 15 north, of range 75 west, of the sixth principal meridian. The soil and climate are favorable to the growth of wheat and barley where irrigable. The open country is generally favorable to winter and summer grazing. The northern part of the Territory has less altitude than the southern, and is said to be more favorable to agriculture.

8. By a general rule as to the relations of different parts of Wyoming, one to another, but as to the whole country geographical divisions might profitably be made, on account of approximate exclusiveness of interests in certain sections, nearness to markets, and for other reasons.

9. The present system of parceling appears to me, all things considered, the most practicable. Discriminations between agricultural and pastoral lands, if discreetly made and honestly carried out, would doubtless be advantageous; but such discriminations would, in my opinion, open the way to the perpetration of frauds. Allowance of larger average to single locators, under the pre-emption and desert-land acts, would probably increase the sales of public lands. Smaller subdivisions than 40 acres and permission to locate on separate and detached lots would suit locators, but would undoubtedly result in closer culling, only the most desirable lands being likely to be chosen, leaving all the poorer and undesirable lands unoccupied.

10. I know of none.

#### AGRICULTURE.

1. Cool and dry; some seasons sufficient rainfall to obviate necessity of irrigation; usually insufficient; heavy snows in mountains during winter keep streams full till July.

2. Rainfall very uncertain; sometimes almost daily showers in May, June, and July; other seasons scarcely a shower during the whole summer. The streams are full when needed for irrigation.

3. Perhaps 1 per cent.

4. Perhaps 10 per cent.

5. Wheat, barley, oats, potatoes, turnips, parsnips, onions, cabbage, and other vegetables.

6. Twenty-five to forty inches, miner's measurement.

7. In this part of the Territory the Laramie River and its tributaries, and several lakes.

8. I have had little experience in irrigation, but from the known constitution of

the soil in this region believe that irrigation would greatly enhance productiveness for a term of years. The greatest elevation at which I have known crops to be raised by my own observation is 8,000 to 9,000 feet.

9. The water actually turned upon lands for the purpose of irrigation is probably all exhausted by absorption and evaporation, none or very little returning to the stream from which it was drawn. Irrigating canals and ditches usually have outlets through which any excess of water not drawn off for irrigation is returned to the stream whence it was drawn. No local regulations or restrictions regarding this matter have been yet established here.

10. What has thus far been done here has been so done to experiment upon the practicability of such enterprise in such climate, with such constitution of soil and at such altitude. The principal enterprise of this character in Wyoming of which I have any knowledge is that of the Pioneer Canal Company of Laramie City. By this company a ditch or canal about 33 miles in length has been constructed, tapping the Laramie River about 25 miles above the city, at a point between Jelm and Sheep Mountains, on the left bank, leading the water out upon the Laramie Plains, passing about 2 miles to the westward of this city. This work is now about completed, and is intended to be available for irrigation the ensuing season. It is proposed to hold the water-right under the sanction of section 2339 Revised Statutes, and an act of the Wyoming legislature, entitled "An act to create and regulate corporations," approved December 10, 1869, sections 28 *et seq.*

11. None have arisen that I am aware of, but should present undertakings prove successful, and other similar ones ensue, conflicts may arise unless wisely and seasonably guarded against by law.

12. As to soil, from one-fourth to one-half; but, owing to the relief of surface, irrigation would be impracticable upon a larger portion.

13. It is, in my opinion, impracticable to establish pastoral homesteads at present. It seems to me that as large a portion of the lands as possible should be reclaimed by irrigation for agricultural purposes, and at the present state of development and advance of experiment the demarkation between lands really and exclusively pastoral and valueless for other purposes, and such as may be rendered agricultural is impracticable. In case of the establishment of such homesteads, in my judgment the amount should be about one section to each settler.

14. At present, no. If put in market, in my judgment the amount should be limited.

15. Two to three acres here. Compares favorably with other plains.

16. One hundred.

17. Twenty.

18. Little apparent change in ten years.

19. A few only at present. Am not aware that fenced ranges have been tested in winter.

20. Stockmen say not. Breeders careful in the selection; breeding animals would probably improve their stock by such specific range system, while the stock of those careless in this regard would probably deteriorate.

21. Flowing streams, mainly supplied by melting snows and springs in the mountains, and large lakes.

22. Seven to ten.

23. Probably diminished.

24. Cattle are said to abandon ranges grazed by sheep.

25. Serious conflicts have not arisen in this section, although some hostility against the increase of sheep-raising and wool-growing probably exists among growers of neat cattle.

26. Number of sheep in county, 50,000; number of neat cattle, 60,000; number of horses, 3,500. Sheep in herds from 500 to 2,500; larger single herds are not advisable. Cattle range at will.

27. None.

28. None. A few corner-stones have been removed, but from those remaining the locus of corners whose monuments have been removed can readily be fixed.

#### TIMBER.

1. The plain lands are barren of timber; the mountainous districts are generally timbered. The timber is principally evergreen, consisting of pine, spruce, fir, hemlock, and cedar, with some aspen, cottonwood, and willow. The timber is of slower growth than in regions having less altitude. The pine, spruce, and hemlock is more windy in growth and yields a small percentage of strictly clear lumber. Native lumber rates lower in market, but for durability is doubtless superior to Eastern lumber. For bridge floors, floors of stores and uncarpeted public offices, native flooring is said by builders to outwear even the walnut and ash of the East. I cannot vouch for this from observation.

2. I am not aware that any trees have been planted in this Territory except about homes, for shade and ornamental purposes, and these are principally from the native

forests, a kind of mountain willow being most frequently selected. The growth is somewhat slower than that of the rock-maple or sugar-tree in the East.

3. I would not dispose of them in this region at this time, but hold them for the common use of settlers, to be devoted as required to the development of the resources of the Territory and adjacent regions. Fine grades of lumber, as before stated, are produced here only in very limited quantities, large quantities of Eastern lumber being imported for use here. Exportation of Rocky Mountain lumber is impracticable from the fact that there is no demand for it abroad at the necessary cost of its production and transportation. It is therefore only available for the use of settlers in adjacent regions, and for the industries and enterprises in which they are engaged. A division or parceling of the timber lands among settlers by sale or grant is impracticable, the timber being aggregated in large mountainous tracts at an average distance of twenty to thirty miles from the settlers' homes, precluding the constant supervision essential to the protection of individual property rights in new and sparsely settled regions. Parties engaged in mining and reducing ores and settlers on tracts immediately adjacent to timber tracts would have inducements to purchase in small lots. Apart from these, except for speculative purposes, there are practically no inducements to purchase timber lands. Regulations for parceling and selling would foster just what the Interior Department professes to have been trying to guard against during the present season. If the government determines upon the policy of allowing no timber to be used from the public domain without the return of revenue, some discreet regulations for the payment of royalty would in my judgment be more conducive to the interests both of the government and people than any regulations for the parceling and sale of lands.

4. Not in Wyoming; but if sales are determined upon such classification would be not only expedient, but necessary to just and equitable disposal.

5. There is a second and thrifty growth both in districts burned over and chopped off.

6. The origin of forest fires is difficult to ascertain. During the present season some of the most destructive fires have been maliciously set by the Ute Indians, destroying more timber than has been cut in Wyoming for all the uses of civilized life since the organization of the Territory, including railroad ties, fuel, and lumber. Other very destructive fires are undoubtedly started by the culpable carelessness of hunters and travelers, who neglect to extinguish their camp-fires. The timber annually used is not 10 per cent. of that annually destroyed by fire. I think the law should visit heavy penalties upon forest incendiaries, even those who become so through neglect or failure to exercise even extraordinary precautions. A few examples, upon substantial proof, would have a healthy restraining influence.

7. Depredations for the uses of life, amounting to infractions of law, have in my judgment been made very rarely, if at all, in this region. The act of Congress approved March 2, 1831, entitled "An act to provide for the punishment of offenses committed in cutting, destroying, or removing live oak and other timber or trees reserved for naval purposes," extracts from which appear as sections 2461 and 4751 Revised Statutes, in my judgment was designed at the time of its passage by the national legislature to inhibit the use of timber only so far as such use should deplete sources of supply for the anticipated wants of the Navy, of which depletion the Secretary of the Navy should be the judge. Unless it can be shown that the timber here used in the building of homes, in the fencing of farms, and the supply of fuel (the two latter being taken almost exclusively from the dead timber) has cut short the sources of supply for anticipated wants of the Navy, I am not aware of infractions of law through forest depredations for the uses of civilized life. No legislation, in my judgment, is necessary to prevent such use of timber.

8. The custom is to cut and use such timber from the public forests as is required for building, mining, fencing, and other domestic and industrial purposes. The same opinion obtains relative to the ownership of felled timber, as is held in regard to gold taken from placer ground, quartz from lodes, grass cut and converted into hay, and water carried out by irrigating ditches, to wit, that it is and of right ought to be the property of him whose industry hath wrought the change.

9. *Cela depend.* Except in maritime parts of the country the administration of restrictive laws upon the use of timber, if such laws are deemed politic, would seem naturally to pertain to the Interior Department rather than to the Navy Department. Believing such restrictions to be impolitic, and their rigid enforcement to be certain to result practically in the restriction of the settlement, growth, development, and prosperity of regions adjacent to the Rocky Mountain timber lands, where and for which this timber is alone valuable, I should regard the least rigid enforcement of such restrictive laws as the most desirable administration.

This being a question of great moment to our people, I have hitherto communicated at length my views to the Secretary of Interior, and later to the Secretary of the Navy, in a lengthy letter, a copy whereof is herewith inclosed, to which your attention is earnestly invited, as a tolerably full expression of my views upon the timber question.

## LODE CLAIMS.

1. Ten years' experience; chiefly in the Black Hills Range and Medicine Bow Mountains of this Territory, in organizing and generally directing prospecting, mining, and milling enterprises, at present having two stamp-mills running—one in Centennial mining district, the other in Douglas mining district—both in the Medicine Bow Mountains. My attention has been directed mainly to organization and financial management, and not to actual work or personal supervision, nor have I had experience in mine litigation. My experience has been acquired at a cost of about \$30,000 worth of experiments.

2. In regard to vertical veins or such as have a pitch not less than  $45^{\circ}$  from the horizon, the present law (i. e., that approved May 10, 1872), so far as it relates to the exclusive use and enjoyment of the vein itself for 1,500 feet in length, with its dips, spurs and angles, by the discoverer thereof, I approve; but in so far as it excludes others from discovering and appropriating any other really distinct parallel vein, I disapprove it. I think the discoverer should have whatever vein he discovers, and surface ground sufficient to work the vein its whole length, and until patent issues he should not have the right to exclude prospectors from searching for other veins; but upon the discovery or supposed discovery of a new vein, if within a certain distance fixed by law, from the established center-line of former discovery, the onus of proof should be upon the latest discoverer that he has a distinct vein. Upon such proof, he should have exclusive proprietorship, upon compliance with the law in other respects, within any distance not less than 50 feet from the nearer wall of earlier claimant. The method of proof above referred to should be fixed by national law, and not left to department regulations, still less to mining district rules.

3. My attention has not been directed to this subject.

4. Veins of the character considered in answer to second question are usually discovered and opened at the top or apex, by which I understand either the outcrop or crevice between walls at the top of bed-rock. Veins discovered by driving prospecting tunnels are of course excepted, and the apex in such case would be determined by raising a winze or shaft to the surface. The course of outcropping fissure veins can be ascertained usually by moderate and discreet outlay. The dip often changes as work progresses, and a knowledge of what the change may be seems not essential to defining the claim under existing laws.

5. Virtually answered above.

6. It has not as to such veins.

7. I cannot understand how two parallel seams could have one outcrop. Two veins of different corners might unite and outcrop at point of union. I have known some contests in cases of this kind.

8. I would suppose this question to apply to a case where one vein had two outcrops, not two veins with one outcrop. In this view no cut-off of original locator has come under my observation.

9. None wider have come under my personal observation. I do not know the width established by local law or rules in the Comstock region.

10. If width by local rules be restricted to the minimum authorized by law, i. e., 30 feet, 25 feet each side, yes; if width by local rules be expanded to the maximum, i. e., 600 feet, 300 feet each side, no, or very rarely, if the real outcrop be traced for any considerable distance and the location be directly taken.

11. I do not know of any such practice under the law. I should regard the toleration of such practice absurd.

12. I do not see how B's location in the case supposed could cloud A's title in the least degree, unless B should prosecute work on vertical shaft to such depth as to cut A's vein and lay claim to it as a distinct vein. I do not see that even this could cloud A's title, but might result in trespass upon his property and loss of his ore. But if in the case supposed B should cut a vein really distinct from that upon which A's claim is based, although outcropping in the surface ground of the latter, that B ought in justice to hold his vein is consistent with the view which I expressed in my answer to second question in this title. I do not maintain that he could do so under existing statutes. This question applied to horizontal, or nearly horizontal veins or deposits opens a new field for discussion. Leadville, White Pine, Nevada, &c., from experience and observation should make full answer to the question. Without having given the subject much thought or attention, I am inclined to favor location in such case by acreage, as in case of coal lands, exterior boundaries of claims to be vertical planes.

13. I cannot answer from knowledge.

14. I think it is possible, and not difficult.

15. Among others, Centennial mining district, Carbon County, Wyoming. By some 40 or 50 miners and prospectors, committee appointed to draft laws, to be presented at adjourned meeting. Officer, recorder elected by ballot; one book for record of lode and tunnel claims, one book for record of placer and ditch claims.

16. Posting notice, setting forth date of discovery, name of discoverer and claimant:

or claimants, course and distance claimed each way from point of discovery, followed by sinking shaft 10 feet or more on vein, fixing exterior boundaries to claim of surface ground, and placing on record with district recorder.

17. In some districts rules allow six months within which developments may be prosecuted and survey be made, copy of which survey is put upon record as supplementary to former record. The course or strike of vein in first record is frequently given as easterly and westerly, northeasterly and southwesterly, &c., and in record of survey definitely fixed as N. 23° 40' W., &c. I am not aware that any district rules presume to tolerate a change from original record, whereby could result infringements on claims made subsequent to first record and antecedent to survey of original locator.

18. Not within my knowledge, although I have been advised of such result in Utah. There is no security against such frauds, except the honor (?) of the recorder.

19. Emphatically yes, so far as district laws are concerned. That a decision of the United States Supreme Court as to the title of property worth \$1,000,000 should turn upon what was at some particular time the whim of a majority of the prospectors and miners in any new camp seems absurd, yet such is the law. But as to record, no; I regard it as a matter of prime importance that record of mining claims be kept in mining districts, for convenient reference of miners and prospectors. It might be well, however, to require all district recorders to furnish transcripts, at stated intervals, to the register of the land office within whose land district the mineral district is situated of all mining records not previously returned, the transcripts to be recorded in the land office in a book kept for that purpose, and then returned to the recorder of the mining district, each transcript to bear the certificate of the register that it is recorded, and to be filed in the recorder's office. The same end might perhaps be more directly compassed by requiring the prospector or miner applying for record to present the instrument of writing which he wishes to have recorded in duplicate, deposit the register's fee for recording, which, with one of the duplicate copies, certified as correct copy, it shall be the duty of the recorder to forward to the land office. The form of the first instrument to be recorded should be uniform throughout the country and established by law.

20. Emphatically, no. I am opposed to all legislation which assigns to ministerial officers judicial functions, as I am to all legislation which assigns to judicial officers ministerial functions. Under our system of government every man who feels himself injured in person or property should not, in my judgment, be deprived by law of redress through the courts. I doubt the advisability of leaving other land claims in contested cases absolutely to the United States land officers, nor do I believe they are so left. The interposition of a court of equity may at any time be sought, nor upon a proper showing would it be denied.

21. I would do away with district laws and the authority of local customs entirely, and let the method of organizing districts, electing recorders, and keeping records, &c., be prescribed by statute. I would have all the conditions of tenure prior to patent and prerequisites for patent definitely fixed by statute, and the same for all mineral districts of the country, unless, for grave reasons, local differences should require some different rules; in which case the law and *locus* of application should be fixed by statute. As to following the dip beyond the side lines, suppose the dip 45°; following the dip 425 feet would pass the side line even at the maximum of 300 feet width. It would not seem advisable to me to stop progress to a greater depth, because the vertical side line is reached at such depth, the lower portion of vein being retained for outside locators, to be reached only on sinking 300 feet or more through unproductive ground. Upon allowance of greater width to original locators, still less advisable would such course be. In veins nearly horizontal, location by acreage, as before suggested, I think most desirable, and if such location be authorized the statute should prescribe the number of degrees in dip which shall be the line of demarkation between the two methods.

22. Yes; five years.

#### PLACER CLAIMS.

1. The proportion can scarcely be fixed, even approximately. The products of placers are gold and soda; the latter being in the form of crystallized sulphate.

2. Somewhat familiar through applications for patents for property in which I am interested mainly.

3. Reference to records of land office recommended.

5. Not from my knowledge so far as they are held for *bona-fide* purpose of mining.

6. The law, in my judgment, should not sanction title to town sites through placer-mine location.

7. I am not aware of such instance, unless it were at Leadville, Colo.

8. No.

9. I do not.

Very respectfully,

S. W. DOWNEY.

*Testimony of A. T. Babbitt, cattle-grazier, Cheyenne, Wyo.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. A. T. Babbitt, cattle-grazier, Cheyenne, Wyo.
2. Two years.
3. One quarter section ; homestead and pre-emption.
6. I regard the desert-land act for application in this Territory impracticable, as in no location that I know of is it possible to irrigate the whole of a section of land. I think that the irrigation of say one-third should be required.
7. Pastoral, and so impossible of irrigation as to be unavailable for farming extensively.
8. I do not believe it at all practicable for graziers to do a successful business on the basis of owning and fencing the land. In this region of severe winds stock must "drift or die."

## AGRICULTURE.

1. Rainfall limited practically to two or three months. Early summer. But about three months, say June to September, exempt from frost. Water for irrigation limited, and irrigable area in exceedingly small proportion.
2. Yes.
3. None.
4. Not to exceed one-fortieth.
5. Oats, and probably wheat. No corn. Potatoes and hardy vegetables.
6. Don't know.
7. In our section the Wyoming Black Hills.
10. As yet but a small proportion, and mainly by homestead and pre-emption.
11. Few or none.
12. Nearly all.
13. It is practicable, and a section or more should be allowed.
14. No. Yes.
15. Twenty-five to thirty.
18. Grazing has considerably reduced it.
19. They usually fence say 100 acres or more for pasture. I do not think they can safely confine stock in winter storms.
20. Yes, if it were safe.
21. Black Hills.
23. They destroy it if the land be at all heavily stocked.
24. No.
25. Cattle men respect one another's claims and rights. Sheep men are aggressive, and drive cattle men back.
27. I believe the grazing as at present on the public domain a decidedly greater public benefit than any sum possible of realization from sale of land, even if it were safe or practicable to buy and fence.
28. I think not.

---

*Testimony of Stephen W. Downey, attorney and counselor-at-law and Delegate in Congress, Laramie City, Wyo.*

LARAMIE CITY, WYO., September 25, 1879.

DEAR SIR: I have the honor to invite your attention to some phases of the matter of timber cutting upon the public domain, the laws inhibiting or regulating the same, the rulings and regulations of the Interior Department thereupon, and the effect of such laws, rulings, and regulations upon the industries and interests of the citizens of Wyoming Territory.

You are probably aware that Hon. Carl Schurz, Secretary of the Interior, has made the discovery and prevention of infractions of the law in this regard and the punishment of offenders the object of special efforts.

From the studious and watchful zeal directed toward the conservation of the public forest wealth, as manifested by the edicts, agencies, and acts emanating from that department, have arisen grave apprehensions of unjust, oppressive, and impolitic exactions and restrictions upon the pursuits of our people, of which some appear to be without warrant in law, others not to have been contemplated by the national legislature upon the passage of the acts whose requirements are claimed to be enforced, and yet others to be clearly usurpations of the functions properly appertaining to the Navy Department.

In consideration of the latter fact I am specially led to make this communication to you, while having in view the general object of placing the matters herein considered before one or more of the Cabinet ministers in order that the fullest light may be shed upon the subject in case it should arise for the consideration or action of the Cabinet.

I solicit your special attention to those phases of the question involving issues assigned by law to the administration of your department.

All such questions relating to felling and removing timber from the public domain as are now at issue between our people and the Interior Department appear to have been originally referred by law to the discretion of the Secretary of the Navy. Subsequent legislation has effected a partial repeal of such law, making special regulations in certain specified States and Territories, assigning the details of these regulations to the Interior Department, the most recent of which legislation expressly announced the repeal of former law only so far as relates to the specified States and Territories, thereby reaffirming the full force of the old statute as to all other States and Territories.

In order to a full statement and exposition of the case as regards the letter and spirit of the law, official action to be taken, and official discretion to be exercised, it will be necessary to advert to the provisions of the old statutes bearing upon the issue, to the provisions of subsequent legislation effecting modifications or partial repeal of the same, to the imperative wants of the people essential to civilized existence in Wyoming Territory, together with their sources of supply, and to the spirit of the laws and of the administration thereof by the government in the past, uniformly fostering the exploration, settlement, and development of resources of the remote and unoccupied portions of the public domain.

By act of Congress, approved March 1, 1817, sections 2458 and 2459, Revised Statutes, the Secretary of the Navy is authorized to select, and the President to reserve from future sales, public lands producing live oak and red cedar, to be appropriated to the sole purpose of supplying timber for the Navy of the United States. Other sections of the same act provided for punishment of trespass upon timber thus reserved.

By act approved February 23, 1822, the President is authorized to use the land and naval forces of the United States to prevent the destruction and removal of timber in the State of Florida, then public unorganized territory.

By act approved March 2, 1831, entitled "An act to provide for the punishment of offenses committed in cutting, destroying, or removing live-oak and other timber or trees reserved for naval purposes," it is provided in section 1 in the most definite, sweeping, and comprehensive language that certain fines and penalties shall be imposed upon any person convicted, first, of cutting or wantonly destroying, or aiding or procuring to be cut or wantonly destroyed any live-oak, red cedar, or other timber reserved pursuant to law for the use of the Navy; second, of removing or aiding or procuring to be removed such timber so reserved without competent written authority, and for the use of the Navy; third, of cutting or removing or of aiding or procuring to be cut or removed any such timber upon other lands of the United States with intent to dispose of, use, or employ the same for any other purpose whatever other than for the use of the Navy. It is further provided in section 2 of the same act that any vessel seized, having on board such timber so cut and removed for the purpose of transportation, with the knowledge of the master, owner, or consignee, shall be wholly forfeited to the United States; and that the master of the vessel wherein such timber has been exported to any foreign country shall be fined not less than \$1,000. The first and second sections of this act appear as sections 2461 and 2462 in the Revised Statutes; the third section of the same act appears as section 4751 in the Revised Statutes, the words "the Secretary of the Navy" being substituted in the Revised Statutes for the words "the commissioners of the Navy pension fund," the Secretary of the Navy having been made "trustee of the Navy pension fund" by act approved July 10, 1832.

Section 4751 Revised Statutes substantially the same, except the substitution above recounted, as section 3 in original act of March 2, 1831, is, in full, as follows, viz:

"All penalties and forfeitures incurred under the provisions of sections 2461, 2462, and 2463, title 'The Public Lands,' shall be sued for, recovered, distributed, and accounted for under the directions of the Secretary of the Navy, and shall be paid over one-half to the informers, if any, or captors where seized, and the other half to the Secretary of the Navy for the use of the Navy pension fund; and the Secretary is authorized to mitigate in whole or in part, on such terms and conditions as he deems proper, by an order in writing, any fine, penalty, or forfeiture so incurred."

This act seems designed to be a substitute, in a great measure, for the act above referred to, approved March 1, 1817, except as to the first two sections of that act still retained in section 2458 and 2459 Revised Statutes.

Before proceeding to subsequent legislation affecting the provisions of the later act or restricting their application I desire to comment briefly upon it, because it is that under which, by the rulings of the Interior Department, the main issue between certain officers and agents of that department and the people of Wyoming has been raised.

It appears evident from the text that the act was designed to punish trespass upon the public timber lands, so far as thereby the sources of supply for the anticipated wants of the Navy might be abridged, and for no other purpose; and that the Secretary of the Navy (originally the commissioners of the Navy pension fund) should be the sole judge of such abridgment, and exercise sole discretion as to what or whether any prosecutions should be instituted under the provisions of the act.

That the institution of proceedings against offenders by officers or agents of the Post-Office Department, of the War Department, or of the Interior Department, or any otherwise, except by and under the directions of the Secretary of the Navy, was ever contemplated seems absurd when it is considered that the Secretary of the Navy, in whom alone the law, by express provision, fixes the power to direct such proceedings, has also the power, by equally express provisions, to mitigate, in part or in whole, any penalty, forfeiture, or fine incurred.

The supposition that this statutory law contemplated any vindication through the agency of the Secretary of the Interior, is sufficiently answered by the fact that the office of the Secretary of the Interior had not been created and did not exist at the time of the passage of said act.

The supposition that the powers and discretion given by the act to the Secretary of the Navy would have been given to the Secretary of the Interior, had such office then existed, is sufficiently answered by the fact that the office of Commissioner of the General Land Office was created in 1812, prior to the passage not only of the act of 1831 but also of the act of 1817, with powers and duties similar to those now pertaining to said Commissioner, but then in the Treasury Department, and to this officer or to the head of his department would have been assigned the discretion given to the Secretary of the Navy had the national legislature contemplated such interpretation of the law as is now sought to be put upon it by the Secretary of the Interior.

The substance and strength of the law is the will of the enacting legislature. If the body of the act under consideration leaves any doubt as to the purpose of its passage, the title seems to set all doubt at rest: "An act to provide for the punishment of offenses committed in cutting, destroying, or removing live-oak and other timber or trees reserved for naval purposes."

The grants made to the various divisions of the Pacific Railroad system rendered section 2461 Revised Statutes inoperative, so far as concerned timber procured for the construction of said roads.

By act approved June 3, 1878, entitled "An act for the sale of timber lands in the States of California, Oregon, Nevada, and in Washington Territory" sales of timber lands are authorized under certain regulations, and section 4751 rendered inoperative in the States and Territory named.

By act also approved June 3, 1878, entitled "An act authorizing the citizens of Colorado, Nevada, and the Territories to fell and remove timber on the public domain for mining and domestic purposes," section 4751 Revised Statutes, seems to have been rendered inoperative by implication, though not expressly, as to all mineral lands in the States of Colorado and Nevada, and in the Territories of New Mexico, Arizona, Utah, Wyoming, Dakota, Idaho, and Montana applying to all persons except railroad corporations, Nevada alone receiving the benefits or burdens, whichever it be, of both acts approved June 3, 1878.

Railroad corporations being expressly excluded from the provisions of the latter act, if such exclusion be constitutional, are necessarily excluded from the provisions of the third section, as well as of the first and second sections, and as to such corporations sections 2461 and 4751 Revised Statutes would still be in force, both upon mineral and non-mineral lands. Therefore, if I am right in my conclusions above in regard to the construction of those two sections, actions against railroad corporations for taking timber from the public domain in Wyoming Territory for the construction or maintenance of their roads can legally be instituted by and under the directions of the Secretary of the Navy alone.

In speaking of the act approved June 3, 1878, I shall refer to the one named second in order above, that being the one which applies to Wyoming.

In the "Rules and regulations prescribed by the Secretary of the Interior" pursuant to said act, in a circular issued from the Department of the Interior, General Land Office, dated August 15, 1878, the Secretary, among other things preliminary to the rules, says: "To the end that the mountain sides may not be left denuded and barren of the timber and undergrowth necessary to prevent the precipitation of the rainfall and melting snows in floods upon the fertile arable lands in the valleys below, thus destroying the agricultural and pasturage interests of the mineral and mountainous portion of the country," &c. (See circular.)

However solicitous the Secretary may be to guard the interests of the agriculturists and herdsmen of Wyoming against the fatal consequences of their own vandalism, and however reasonable such a setting forth of the grounds and cause of action may be, applied to other regions, it seems absurd in its application to Wyoming, the great body of whose lands, by the decision of the same Interior Department, rendered prior

to the issuance of said circular, have been held to be "desert lands" within the meaning of the "desert-land act," approved March 3, 1877. Yet Wyoming alone, of all the eastern slope of the Rocky Mountains, has been chosen by the department as the field of active operations for the repression of timber cutting upon the public domain.

The first rule in said circular announces that section 2461, Revised Statutes, is still in force, and that trespassers upon lands not mineral "will be prosecuted under said section." Under whose directions will they be prosecuted? Is the Secretary of the Interior the mouth-piece by which the discretion of the Secretary of the Navy is to be promulgated? If section 2461 is in force in Wyoming as to all lands not mineral, section 4751 is also in equal force, there being nothing in the act of June 3 to the contrary. Yet under such rulings, through officers or agents of the Interior Department, a demand has been made upon railroad-tie manufacturers, lumber manufacturers, and wood dealers for a fine, forfeiture, or stumpage tax for timber taken from the public domain, or alleged to have been so taken, prior to June 3, 1878. Through the same agency a demand has been made upon lumber manufacturers for a sworn statement of the extent of trespass by them committed, as a basis for compounding the offense, accompanied by intimations or menaces of some undefined evil to befall upon neglect or refusal to furnish such statement; all of which demands, as well as settlements made pursuant to acquiescence therein, and by officers or agents of the Interior Department, I claim to be without warrant in law.

Through the same agency an order has been served upon tie makers, lumber manufacturers, and wood dealers in Wyoming, inhibiting all further cutting or removal of timber, of whatever character or dimensions, from the public lands by them, whether such lands be mineral or non-mineral, and whether such timber be dead or alive. With this order of inhibition has been announced the adoption as a rule of action of the principle that the wood dealer, lumber manufacturer, and tie maker is each barred from the pursuit of his vocation by the act approved June 3, 1878—i. e., that John Doe being a merchant may shoulder his axe, go and cut from the public forest such timber as he may need for fuel, fencing, and buildings, provided the same, dead or alive, be not less than eight inches in diameter, or that he may hire the same to be done for him, provided the mediate agent be not a wood dealer or lumber manufacturer; but that Richard Roe, a wood dealer, or Henry Jones, a lumber manufacturer, may not anticipate the wants of John Doe and prepare to supply his wants on demand, because this would savor of speculation. Such ruling and action based thereupon I claim never to have been contemplated by the national legislature upon the passage of the act. All organized and systematic business is speculative so far as it is based upon anticipated want. The more accurate anticipations of want are, the more successful will business be. Such a departure from this principle as the ruling above stated enjoins is a return toward the primeval and barbarous state, in which each man must provide for his own wants by the labor and skill of his own hands. I do not know whether or not the agent of the department has transcended his instructions in announcing this absurd principle and acting upon it, but I do know that the industries mentioned are at a dead standstill, checked by the order referred to, and this with the knowledge of the Commissioner of the General Land Office. At the same time no ban is laid upon similar pursuits in the State of Colorado, just south of us. If any credence can be placed in the public journals, a dozen or more saw-mills have been put in operation within a year in the vicinity of Leadville, all manufacturing lumber from timber taken from the public domain. Homes are warmed, food prepared, and ores reduced there by fuel taken from the public forests, furnished in whole or in part by wood dealers and lumber manufacturers pursuing their vocation. Can it be that these operations carried on there, where are operating alert capitalists from San Francisco, New York, and London, are less speculative than here, where lumber manufacturing has been, and but for the present ban put upon it would now be, carried on to a limited extent, and exclusively to supply the ordinary home demand? Whatever the general and ultimate rights of the issue, such discrimination against Wyoming as between it and Colorado cannot be justified.

I do not institute this comparison desiring Colorado to be placed under the same ban. On the contrary, I believe the privileges and immunities there accorded and enjoyed to be in full harmony with the letter and spirit of the law.

Colorado has made great and praiseworthy progress within the past fifteen years, adding much to the credit and wealth of the nation; a progress which would have been utterly impossible without, and is largely due to, repeated and constant violations of the inhibitions of section 2461 of the Revised Statutes, according to the interpretation of those inhibitions by the Department of the Interior. Many of the mineral products of Gilpin County, the first great mining center, could not be utilized on account of their refractory nature until the inauguration and successful operation of the Boston and Colorado Company's Smelting Works, at Black Hawk, by Professor N. P. Hill, now United States Senator from that State. These works probably did more to establish the worth of Colorado minerals and the success of Colorado mining, and consumed more fuel procured through violation of the inhibitions of section 2461 of

the Revised Statutes, than any three other reduction works of Colorado. Nine-tenths of all the stamp-mills or other reduction works have been run by steam power, and the fuel procured in the same way. Nine-tenths, probably ninety-nine hundredths, of all the buildings erected prior to June 3, 1878, were constructed wholly or in part of lumber obtained by the same violation. To say that such use of the timber upon the public domain was not contemplated, and was wrong and criminal, is to say that the progress made in the development of the resources of Colorado, the growth in wealth, the increase in population, the establishment of homes, the founding of institutions of learning, and the building of churches were not contemplated, and were wrong and criminal. Yet all this has been carried on for the last fifteen years, under the eye and with the full knowledge and consent of Congressmen, Senators, Cabinet ministers, Vice-Presidents, and the President of the United States, who have from time to time visited Colorado. With none of these industries, none of this progress, none of this settlement and increase of population, the timber of Colorado might as well have been put in the moon, so far as any value it would have possessed to the United States government or anybody else. It was valuable precisely for the use to which it has been devoted, and for no other use.

The timber of Wyoming is valuable alone for use within Wyoming, or in regions immediately adjacent thereto, and sinks in value as that use is obstructed.

It is a fact greatly to be regretted that far more timber is annually blasted and destroyed by the ravages of forest fires than is cut up for use for all purposes to which it is devoted. While I write a fire is raging in the Medicine Bow Mountains, some thirty-five or forty miles to the west of Laramie City, which has already swept through thousands of acres of the heaviest timber, enveloping a region of more than 1,000 square miles in dense clouds of smoke. The trees thus destroyed in a few weeks would have kept all the lumber manufacturers, tie makers, and wood dealers in this portion of the Territory occupied for years in supplying the demands of the people, while they, upon the order of the agent of the Interior Department, are standing idly by witnessing the destruction by conflagration of what they are not permitted to devote by their industry to the uses for which it is chiefly valuable. Such forest fires are of almost annual occurrence. In many cases the limitation of their spread is dependent upon the presence of timbermen, who, when present, are able to take advantage of glades and cut off the progress of the flames. I am informed by Mr. C. H. Buzzard, who has been one of the leading tie manufacturers in this region, that if he had been engaged, with his usual number of employes, in the region of the present fire, he could have checked it before extensive damage could have been done.

The idea, more or less prevalent in the East, that tie-making and lumber manufacturing in the Rocky Mountains is a kind of royal road to wealth, is altogether a mistake. Few engaging in such pursuits gain more than a livelihood; as many fail utterly; and, like the majority of their patrons engaged in other pursuits, they have nothing to depend upon but their industry and energies. With few exceptions, we are all struggling along on the ragged edge of poverty for an existence; a condition not by any means unique or unusual in new and sparsely settled regions. We are surrounded by many varied and extensive resources, teeming with the germs of future wealth, but yet mainly undeveloped, and we are without the means for present development. We need the *fostering*, not the *repressive*, hand of government.

If section 2461, Revised Statutes, is to be construed strictly as maintained by the Interior Department, many high officers of the government, upon impartial prosecution, would fall under like condemnation as the citizens of Wyoming. The War Department has violated and continues to violate, in the most marked and open manner, its inhibitions. In Wyoming alone, there are some ten or eleven military forts, constructed wholly or in part of timber felled and removed in violation of those inhibitions. The forts which are or have been occupied have been or still are supplied with fuel by contractors—violators of the same inhibitions. It is no answer to say that such employment of timber is for government use, for the language of the statute is: "If any person shall cut, or cause or procure to be cut, or aid, assist, or be employed in cutting, any live oak, or red cedar trees, or other timber on, or shall remove, or cause or procure to be removed, or aid or assist or be employed in removing, any live oak or red cedar trees or other timber, from any other lands of the United States, acquired or hereafter to be acquired, with intent to export, dispose of, use or employ the same in any manner whatsoever other than for the use of the Navy of the United States, every such person," &c., &c. The building and heating of a United States military fort upon the plains is certainly an employment other than for the use of the United States Navy. Upon a strict construction any person, be he Secretary of War or General of the Army, who cuts, or removes, or causes or procures to be cut or removed from the public domain timber for the use of such forts is obnoxious to all the penalties imposed by the statutes as much as the humblest squatter who constructs his rude hut or cabin. An officer of the government, even the President himself, has no more right to violate law and do an act therein characterized as felony than has a private citizen. The War Department is not alone in the condemnation.

The judges of the United States courts, the United States attorneys, United States marshals, registers and receivers, and special agents of the Interior Department are all sheltered by roofs and warmed by hearths supplied by violation of the said inhibitions. The very exclusiveness of the use reserved in the act of March 2, 1831, no provision being made for any other department of the government, tends to establish the interpretation of the act which I first gave above, and confirms the ruling that what fines or penalties, or whether any, shall follow infractions of said inhibitions rests wholly with the discretion of the Secretary of the Navy, and that the exercise of that discretion should depend upon whether or not sources of supply for the anticipated wants of the Navy have suffered abridgment.

To encourage the development of latent resources, the increase of immigration, and the expansion of civilization the government has wisely sanctioned the most unrestrained use of its agricultural resources, its water supply, and its mineral wealth. It is difficult to see upon what principle pioneer citizens should be restrained from enjoying the ample timber resources to the extent required for domestic purposes. Mineral wealth, once exhausted, offers no hope of restoration by reproduction where exhausted. Quite the contrary is it with timber wealth. Portions of timber land in Colorado, entirely denuded in the early days, are now covered by a fine growth of promising young trees. The timber of Wyoming would not be exhausted by the uses of the people in ten generations. Cut it all off, and it will be replaced in three or four generations by natural growth.

I have alluded incidentally to the use of timber for railroad purposes. A few words directly to that subject: The government thought it expedient, in order to secure the construction of the Union Pacific road, not only to devote all necessary timber from the public lands to that purpose, but also to subsidize the enterprise by other grants of large proportions. Is the maintenance of the road, with the increased facilities of communication which it has brought, and the consequent arrangement and ordering of commercial transportation, of less importance to the government and the people than the construction? Where, if not from the public domain, shall ties be obtained? Would it be the exercise of a wise discretion to compel their purchase from the Alleghany Mountains and transportation to Wyoming to keep up a road-bed along or near the forests here? All cutting of ties upon any terms from public lands in Wyoming is at present banned by order emanating from the Interior Department, whether with or without warrant of law. Should the question come for decision to the Secretary of the Navy, where I think the law clearly places it, as I have before indicated, would absolute prohibition upon any and all terms be discreet governmental policy? The United States has an important, direct interest in the economical and successful operation of the Union Pacific Railroad, which both justice and discretion dictate should be permitted, on some reasonable terms, to procure ties from the forests of Wyoming. Some portions of the timber lands are within railroad limits, and where these are yet unsurveyed the company, under present rulings, is practically barred from its own as well as from government lands. At the same time a large amount of fuel has been taken from railroad lands, both for private and government use, and no objection has been made by the company. In view of these facts the prohibition now sought to be put in force seems impolitic, and can scarcely be characterized as magnanimous.

The act of June 3, 1878, is objectionable even with the most liberal construction. That agriculturists and denizens of towns adjacent to timber growing on mineral lands should be accommodated with all necessary timber for fuel, building, and other domestic purposes, while similar classes adjacent to timber growing on non-mineral lands should be debarred from like privilege, is not based upon any fair, sound doctrine. In the first section of the act the words "said lands being mineral and not subject to entry under existing laws of the United States, except for mineral entry," should have been omitted; and in the second section the word "mineral," before the word "land," should have been "timber." The act is faulty in other respects, chiefly in its uncertainty and in the possible susceptibility of the interpretation which has been put upon it. The faults in the text of the act are, however, as a matter of course chargeable only to the enacting legislature, and it is to be hoped will be remedied at the next session of Congress either by amendment or repeal of the present and the enactment of a better statute.

During the late extra session of Congress, at an interview with the Secretary of the Interior, I represented to him the matters and facts herein considered pretty fully, bringing to his attention many points from this omitted, at the same time presenting a written request for his reconsideration of certain features of the "rules and regulations" promulgated from his department, stating in what particulars changes seemed desirable, and giving reasons therefor.

The features which, according to the announced instructions of the special agent of the department in Wyoming, would work evil to the citizens and which are especially complained of are: First, the prohibition of all persons from felling or removing all timber, dead or alive, less than eight inches in diameter; and second, the prohibition of mediate operators, such as lumber manufacturers, wood dealers, &c., from prosecuting

their vocations for supplying the citizens of the Territory by felling and removing timber for building and other domestic purposes.

The grounds of complaint of the first feature are, that there are immense tracts of dead timber, suitable for fuel and fencing; less than 8 inches in diameter which is passing into decay; that thousands of acres of land have been taken up by actual settlers, through pre-emption, homesteading, under the desert-land act or otherwise, which lands have no timber for fencing or building. Settlers upon these lands have had recourse to the mountain forests for building timber and fencing poles. These settlers must fence their claims or abandon them. A prohibition of the privilege of obtaining fencing poles, whatever the design, results practically as bad faith on the part of the government. The fencing poles ordinarily obtained and used range from 4 to 7 inches in diameter, averaging about 5½. Trees of such size, for such use, are more valuable than those of larger size.

Acts of Congress and rulings of governmental departments cannot alter established principles of political economy, among which none is more generally acknowledged and none more readily commends itself to quick discomfit than the policy of reasonable assortment and division of labor. The average settler does not transport a saw-mill among his chattels. He must purchase the lumber for his dwelling from him whose regular occupation is that of a lumber manufacturer. The average baker is not an axman, he must purchase his fuel from the woodman or collier. I have already remarked upon this feature of the ruling, and need not enlarge upon it.

At the same interview with the Secretary, I asked and received a promise that, whatever course he decided upon in regard to the general, ultimate issue, no action should be taken or restrictive measures instituted against the citizens of Wyoming that were not also taken or instituted against the citizens of other Territories and States where the same laws are in force. According to my recollection, Hon. N. P. Hill, United States Senator, and Hon. J. B. Belford, Representative of Colorado; Hon. Martin Maginnis, Delegate from Montana, and other gentlemen were present and participated in the interview. About the same time I had an interview with Hon. Edgar M. Marble, Assistant Attorney-General, Department of the Interior, and several interviews with Hon. J. A. Williamson, Commissioner of the General Land Office, upon the same subject. I refer to these several interviews here merely to show that I took what I conceived to be proper and reasonable steps to avert impolitic and oppressive restraint menacing the industries of our people by a fair presentation of the case to the department moving for such restraint before making any appeal to you or to the Cabinet generally. The result of my efforts, both as to promises secured and subsequent action, is shown in the foregoing pages.

It is not my purpose to assail herein the sincerity of the honorable Secretary or of any officer or agent of the Interior Department. I am prone to believe the action above set forth to be the consequence of a misconception of the real merits of the case, but on that account none the less ill-advised and impolitic, and in effect upon the citizens of Wyoming none the less unjust and oppressive.

I therefore ask, in behalf of the people whom I represent, a candid consideration by you of the letter and spirit of the laws, and of the facts and issues which I have presented, and that you take such official action, as head of the Navy Department and as Cabinet minister, for the relief of the citizens of Wyoming from their present distress as the laws and facts in the case and the history and philosophy of the spread and development of civilization in the country shall seem to warrant.

If the interpretation which I have put upon the act of March 2, 1831, sections 2461, 2462, and 4751, Revised Statutes, seems to you just, reasonable, and conducive to the growth, development, and general prosperity of the regions adjacent to the timber lands of Wyoming, where alone such timber is valuable, and to which growth and development it is naturally tributary, I ask that, in the capacity of Secretary of the Navy, you signify in some effective manner the retention and exercise of the lawful functions of your office to the prevention of usurpations of the same by officers or agents of the Interior Department, and that you so exercise the discretion given you in said act as to foster the prosperity of this region.

If the interpretation of the act approved June 3, 1878, by the Interior Department seems inconsistent with the purpose of the national legislature upon its passage, and not conducive to the interests of the people for whose benefit it was passed, I ask that, in the capacity of Cabinet minister, you use reasonable efforts to secure a modification of the interpretation and rulings and orders based thereupon.

Finally, I ask, as a courtesy, that you communicate to me, at as early a day as practicable, your views and proposed action, if any, upon the matters herein submitted.

I have the honor to remain, with much respect, sincerely yours,

S. W. DOWNEY

Hon. R. W. THOMPSON,

Secretary of the Navy, Washington, D. C.

*Testimony of George Ferris, stock raiser, Fort Steele, Carbon County, Wyoming.*

The questions to which the following answers are given will be found on sheet facing page 1.

FORT STEELE, CARBON COUNTY, WYOMING,  
November 19, 1879.

RESPECTED SIR: Your circular with questions in regard to the public domain has been carefully read, and herewith find a few answers:

1. George Ferris, on Platte River, 12 miles below Fort Steele; stock raising.
2. Fourteen years.
3. Have sought to acquire title to land, but price was too high; land is not surveyed.

AGRICULTURE.

1. Climate dry and cold; rainfall very light; length of seasons five months; snow-fall light in the lower valleys, heavy in the mountains, very often 10 feet in depth; supply of water is ample in most of the valleys.

2. Rainfall mostly in May and June and very limited; high waters in May and June.

3. There are no crops raised here without irrigation.

4. Farming will always be very limited in the southern and middle portions of the county.

5. Wheat, barley, oats, and most of the hardy vegetables.

6. Have not had any experience in irrigation.

7. Platte River and its tributaries.

10. But little water utilized.

12. Nearly all is pastoral lands.

13. It is, in amounts not to exceed 10,000 acres.

14. It should be limited to 10,000 acres, and such laws passed as to prevent parties from acquiring title to more than the amount stated. The law should be so enacted that in case parties fell heir to lands, thereby giving them an excess of 10,000 acres, the excess should be sold within one year's time.

15. Twenty-five acres.

16. Four hundred head.

17. Have no idea.

18. But little changed.

19. But little fencing. Yes.

20. Yes.

21. Platte River and its tributaries.

24. No.

26. Cattle 50 to 20,000; sheep up to 3,000.

28. But little surveyed land at present date.

Yours, respectfully,

GEO. FERRIS.

*Testimony of Edward Iverson, president Wyoming National Bank, Laramie City, Wyo.*

LARAMIE CITY, WYO., November 13, 1879.

HON. THOMAS DONALDSON, Public Land Commissioner, Washington, D. C.:

Your circular sent out under letter dated September 16, 1879, reached me sometime since. Upon careful consideration of questions therein presented, to which answers are severally required, and in view of the limited practical experience which I have had in other fields of industry, I have decided to confine my replies to the timber business, answering in order to the questions presented in circular.

1. The plain lands are almost entirely devoid of timber, while the mountainous districts are in the main well timbered, principally with evergreen trees, consisting of pine, spruce, fir, hemlock, and cedar; with aspen, cottonwood, and willow in the lower gulches, and being of slower growth than the timber in regions less elevated above sea-level. The percentage of choice lumber produced is very small, not because it is less durable than eastern lumber of the same woods, but because more knotty, windier in grain, and hence less susceptible of fine finish. For floors of bridges, stores, unpaved public offices, bar-rooms, &c., native flooring is said to outwear eastern flooring, even walnut and ash.

2. Few trees have been planted in this Territory, except for ornamental and shade trees, and these are for the most part native forest trees.

3. In my judgment the government timber lands of the Rocky Mountain region should not be disposed of to purchasers at the present time, but should be held by the

government for the use of settlers upon agricultural lands as required by them, as inducements to settle and improve adjacent regions, which lack many attractions possessed by eastern prairie lands, and present to settlers many asperities from which more eastern regions are free. Strictly clear lumber, as before intimated, is produced here only in very limited quantities, large quantities of eastern lumber being imported for the use of our people. Exportation of the Rocky Mountain lumber is impracticable from the fact that there is no demand for it abroad at the necessary cost of manufacture here, increased by cost of transportation. It is therefore only available for the use of settlers in the regions near the mountain forests, and for the industries and enterprises in which they are engaged. A division or parceling of the timber lands among the settlers, by grant, purchase, or otherwise is impracticable, the timber being aggregated in large tracts at an average distance of probably twenty-five miles from settlers' homes, precluding that constant supervision essential to the protection of individual property rights in newly and sparsely settled regions. Parties engaged in the mining and reduction of ores, and settlers on tracts immediately adjacent to timber lands, would have inducements to purchase in small lots. Apart from these, except for speculative purposes, there are practically no inducements to purchase timber lands. Regulations for parceling and selling would foster just the speculations which the Interior Department professes to have been guarding against during the past year. If the government determines upon allowing no timber to be used from the public domain without the return of revenue, some discreet regulations for the payment of royalty would, in my opinion, be more conducive to the interests of the government, and of the people in this region, than any regulations for the parceling or sale of lands.

4. No; not so far as Wyoming is concerned, but if the government determines upon selling the timber lands, a close classification of timber lands, both as to character and quality of timber and as to the amount borne per acre, would be not only expedient but necessary to an equitable disposal.

5. There is a second and thrifty growth both in districts burned over and in those chopped off. Could fires be stopped entirely the timber would be sufficient to last for the ordinary purposes of the region for ten generations. Cut it all off and it would be restored by spontaneous growth in three or four generations.

6. The origin of forest fires is difficult to ascertain in many cases. Very extensive fires in Northern Colorado this season have been started by the Ute Indians, destroying more timber probably than has been cut in Wyoming since its first settlement for all the ordinary uses of civilized life. Other very destructive fires are kindled through the wanton vandalism or culpable negligence of tramps, hunters, and travelers; yet others are started by lightning flashes. The timber annually used is probably not ten per cent. of that annually destroyed by fire. In my judgment heavy penalties should be imposed by law upon any person who starts a forest fire even by culpable neglect. Proof of guilt would be difficult, but a few examples upon clear proof would have a salutary effect in deterring others from the commission of similar offenses.

7. Depredations for the uses of life, amounting to infractions of law, have, in my opinion, been made very rarely if at all in this part of the country. Section 2461 of the United States Revised Statutes, under the provisions of which it is proposed by officers of the Interior Department to punish depredators, seems to be better remembered than section 4751, which is part of the same act of Congress, approved March 2, 1831, entitled "An act to provide for the punishment of offenses committed in cutting, destroying, or removing live oak and other timber or trees reserved for naval purposes." The last-named section provides that no suit shall be brought for fines, penalties, and forfeitures incurred under section 2461, and other sections of the same act of Congress, except under the direction of the Secretary of the Navy, who is expressly authorized to mitigate, in whole or in part, fines, forfeitures, and penalties so incurred. At the time of the passage of the said act the Interior Department had not been created, but the office of Commissioner of the General Land Office had been created in 1812, with similar functions to those now pertaining to that office, being then a bureau of the Treasury Department. To the Commissioner of the General Land Office would have been given the discretion upon timber depredations and the punishment thereof, by the said act of Congress, instead of to the Secretary of the Navy, if the view now promulgated by the Interior Department had then obtained with the Congress that enacted the law. The Rocky Mountain timber regions were scarcely known at the time of the passage of the act in question, but the live oak and red cedar timber of the Gulf region were suffering depredations by speculators, and the evident design of the act was to punish infractions so far, and only so far, as the same should deplete the sources of supply for the anticipated wants of the Navy. Unless it can be shown that the timber here used in the building of homes, in the fencing of farms, and the supply of fuel (the two latter being taken mainly from the dead timber), has cut short the sources of supply for the anticipated wants of the Navy, I am not aware of infractions of law through forest depredations for the uses of civilized life. No legislation, in my judgment, is necessary to prevent such use of timber. On the contrary, it should be

as free as the grass on the plains for the fattening of herds, the water of the streams for refreshing the soil, and the mountain elk for food.

8. The custom is to cut and use such timber from the forests of the public domain as is required for building, mining, fencing, and other industrial pursuits. The same opinion obtains relative to the ownership of felled timber as is held in regard to gold taken from placer ground, quartz from lodes, grass cut from plains converted into hay for sale to the government, and others, to wit: that it is and of right ought to be the property of him whose industry has created the value. The business of tie-making, lumber manufacturing, wood-chopping and the delivery of same to consumers in this Rocky Mountain region, are no royal roads to wealth, but constitute some of the few fields of enterprise upon which industrious pioneers can win a livelihood. Their relation to the general government is not unlike that of the self-exiled passengers of the Mayflower to the home government of England when they stood amid the primeval forests of Massachusetts. The British King and court of London then held as eminent domain over those forests as the American President and Cabinet at Washington now hold over the forests of Wyoming. Had the same ban there and then been put upon the woodman's ax that seeks to guard our forests here, the fathers of American liberty would have found therein graver cause for rebellion than is recorded in the pages of history.

9. The enforcement of restrictive laws upon the use of timber on the public domain, except in maritime parts of the country, would seem to pertain to the Department of the Interior, rather than to the Department of the Navy; if indeed such laws and their enforcement are deemed politic. Believing such restrictions to be impolitic, unjust, unnecessary, and oppressive, and in their rigid enforcement certain to result in the restriction of the settlement, growth, development, and prosperity of regions adjacent to the Rocky Mountain timber lands, where and for which this timber is alone valuable, I should regard the least rigid enforcement of such restrictive laws as the most desirable administration.

With much respect, your obedient servant,

EDWARD IVINSON,  
*President Wyoming National Bank.*

---

*Testimony of E. Nagle, merchant, Cheyenne, Wyo.*

HON. COMMISSIONER PUBLIC LAND OFFICE,  
*Interior Department, Washington City, D. C.:*

DEAR SIR: Inclosed circular handed me through Hon. Thomas Sturgis, this city, with request to reply. Hereto I have the honor to attach answers in part, applicable to pastoral land embraced in the southeastern portion of Wyoming Territory.

Very respectfully, yours,

E. NAGLE.

AGRICULTURE.

3. None.
4. Not sufficient water to cultivate over one acre to each 100 acres.
5. Nothing excepting hay and a few early vegetables.
7. Limited supply of water in this county for irrigation, excepting a few miles on the Laramie River and North Platte.
10. Very little land taken up in this country; none for cultivation excepting for hay lands.
12. Nine-tenths, exclusive of the timber and mineral land.
13. It is not practicable to locate homestead or pre-emptions on these lands except for grazing purposes. Any pre-emption granted should grant at least 25 acres of land to each head of cattle the pre-emptor may own, with privilege to pre-empt extra for the increase of his herd. His taxable number would not give land enough from the fact that property is not taxed over 60 per cent. of its number or value in this section. If pre-empted he should be allowed to pre-empt 25 acres per head he may actually own and have on the land at time of filing his intentions, and also 15 to 25 acres per head as a limit to his right to increase his herd. The price must be nominal, with a reasonable time allowed for the taking up of his location and patent for the land. The cattle business will not admit of high-priced land, and it is doubtful if it can be successful on all sections at any price if title is granted for nothing.
14. It will be disastrous to the cattle interest and the Territory to put these lands into market excepting to actual occupants, and then should be limited to the number of head of cattle, sheep, or horses he may actually own or have in his control.
15. This can be answered indefinitely only. Reason: that pre-emptors or locators will probably be required to locate in solid tracts that he may now be grazing upon;

for instance, a person owns 50 head of cattle and has a right to locate 25 acres per head, this makes but 1,250 acres, which if taken on valley or bottom land, he will get say one-half of choice grass lands, while a party owning 5,000 head, at 25 acres per head, gives 125,000, and may not get 500 acres of choice bottom grass lands and several thousand acres which is of no value at all for any purpose whatever. I fix the entire county on a basis of 25 acres per head, while the best grass or meadow lands, which is limited, will not require over 10 acres. But the millions of acres of upland are of no value unless a portion of bottom lands can accompany them for hay purposes.

18. Grass is diminishing by grazing and tramping of stock.

19. Do not fence. It will be an experiment to fence the cattle ranges. Opinions differ in regard to fencing. Locations are different; some can fence without fear of loss, while others will probably prove fatal.

20. Herds will be improved from the fact that it will be the best interest of the grower.

21. Limited; large tracts are too far from water to graze on.

24. Sheep and cattle will not graze on the same lands at the same time.

27. I deem it to the best interest of the stock growers at present for the lands to remain as they are; but if the government desires to part with the title to these lands they should be sold at very low price—say 5 cents per acre—to actual occupants only or by pre-emption, allowing each occupant to locate his present range as near as possible, conflicting rights or disputes to be settled by the land office; a law compelling locators to join fence and pay each their equitable proportion; no damages to be allowed for trespass during storms in winter; the lands taken by sections where surveyed in direction and location as his present ranch or claim; the surveyor-general of the Territory to set aside what is to be classed as timber and mineral lands from the pastoral lands where the lands are surveyed; where unsurveyed, they to be classed by the surveyors at the time of making the surveys.

If the government desires to derive revenue only, then allow occupants to locate the same as by pre-emption, giving them the privilege to pay for same at a set price or pay an annual rental per acre, giving a lease for not less than fifteen years or over twenty years.

I think the most equitable mode of rental will be to tax each person so much annually per head for cattle running at large on the public domain; at the same time extend the right to location or pre-emption to those who may choose to avail themselves of the privilege to purchase.

Timber lands should never be sold in any manner; title should remain with the government and give away or sell the timber to occupants of the Territory only.

---

*Testimony of William K. Sloan, mining, smelting, charcoal, and lumber manufacturer, Hilliard, Uintah County, Wyoming.*

The questions to which the following answers are given will be found on sheet facing page 1.

1. Wm. K. Sloan, Hilliard, Uintah County, Wyoming; mining, smelting, charcoal, and lumber manufacturer.

2. Seven years.

3. I have. By pre-emption and under the desert-land act.

5. Have had no difficulty in procuring title to my land.

7. The conformation of this county is hilly in the central and eastern portions and mountainous in the northern and southern parts; principally pastoral in the central, interspersed with coal fields; in the north and south parts a stunted growth of timber; in the mountains mineral in small quantities has been discovered in nearly all the mountain ranges; the agricultural portion is very small.

#### AGRICULTURE.

1. Long, cold winters; short, cool summers; little rainfall; frost to July 1 and from September 1 with few exceptions.

2. The larger streams are usually at their highest stage in June, and after that fall rapidly, but furnish ample water for all irrigating purposes.

#### TIMBER.

1. The section of country situate south of the Union Pacific Railroad on the head of Bear River and its tributaries contains about 50,000 acres of timber, principally white spruce and quaking aspen of stunted growth, rarely exceeding 14 inches in diameter at the base of tree. Very little if any could be used or considered clear logs.

2. No trees have been planted except cottonwoods, and of those but few; other trees such as black locust and box elders might grow if properly cultivated, but on account of altitude their growth would be slow.

3. By giving free to all settlers all timber that they may require for use for fuel, building, fencing, mining, smelting, and manufacturing purposes, when not exported outside the Territories—provided no growing timber is cut or used measuring less than six inches in diameter for other than agricultural purposes, like fencing, &c. It would undoubtedly be advantageous for the second growth of all timber to have dead and fallen timber removed as speedily as possible and thus avoid to a great extent the future destruction by fire of the young timber. Many thousand acres of young pines and quaking aspen have been destroyed by fire this past season in this section that could have been saved had it not been for the masses of dead timber interspersed through it; there is more than enough of such timber in Wyoming and Utah that could be used for fuel, charcoal, or fencing in the next ten years, or prior to its becoming worthless by decay. The use of such timber most certainly should be accorded free. I have no hesitancy in saying that the want of good growing timber is too keenly felt by the settlers of these Territories to permit of their firing it in order to avoid the payment of stumpage or other tax.

If it is deemed to the interest of the government that timber should be paid for by the poor and half-starved pioneers and settlers of the Territories when used for the purpose of building up these Territories and making them habitable—in that case charge a low stumpage tax, say not to exceed 50 cents per foot, on saw-logs eight inches in diameter and over, and 10 cents per cord for wood, but permit no green or growing timber to be cut under 6 inches in diameter unless for fencing purposes. The sale or lease of timber lands in the Territories would tend to a monopoly in some sections of the Territories if not in all.

4. Would not classify the different kinds of forest lands in manner of disposition, &c. The quality of the timber and its accessibility changes in every county and cañon, and could not be fairly classified.

5. There is usually one-third spruce and two-thirds quaking aspen as second growth where timber has been burned off, and think there would be the same result where timber has been felled; should think it would require twenty-five to thirty years for a spruce to acquire the diameter of ten inches.

6. Forest fires are started generally from two causes: 1st. Indian hunting parties, who start fires for the purpose of driving game and a natural love all Indians have for setting fire to grass or timber when passing over or through it. 2d. Through culpable negligence on the part of white hunters and fishing parties leaving their camp-fires unextinguished. Extent of fires: I should estimate that two-thirds of the timber in this belt has either been destroyed or killed by fires during the past summer, they having been unusually destructive, caused by extreme drouth. Prevention: keep Indians on their reservations. Make and enforce very severe laws against the whites, say two or three years in penitentiary and \$500 fine for starting such fires, accident or carelessness not to be considered an excuse. Two or three prosecutions under such a law would effect a cure or tend to make transient campers more careful.

7. To my knowledge there has been no willful destruction or waste of timber in either of the Territories of Colorado, Wyoming, Utah, Idaho, or Montana. In cutting saw-logs and railroad ties tree tops are left, proving destructive to the growing timber if left on the ground. In case a fire should break out I would make it obligatory on persons cutting logs or ties to clean up *debris* by cording up that portion suitable for fuel and destroying the brush.

8. Logs, ties, and wood are usually cut and delivered by parties who make that their business, and sold to railroad companies, saw-mills, mine owners, smelting works, charcoal manufacturers, agriculturists, in fact to nearly all consumers. Timber: pine and aspen, is not often to be had near place of consumption, nor does it grow nearer than from thirty to fifty miles from arable lands, in most cases over that distance. The ownership of timber, wood, ties, &c., is exclusively in the parties who fell it, until delivered to the party contracting for same.

9. I think that the control or management of the public timber lands, under the law, should be placed in the hands of the district land officers, with power to employ an efficient and capable man or men acquainted with the timber business and the country, to act as supervisors of the timber sections on behalf of the government, and see that the laws in regard to the cutting and preservation of young timber are complied with, and in case a stumpage or other tax law is to be enforced on timber cut, it shall be the duty of such appointee of the local land officers to examine into the correctness of the returns made by parties cutting timber; and it shall also be a part of his duty to act as a patrol or detective in case of fires being started in his timber district, with a view to punish the offenders.

*Testimony of George R. Thomas, register of the land office, eastern district of Wyoming*

UNITED STATES LAND OFFICE,  
Cheyenne, Wyo., November 14, 1879.

DEAR SIR: In accordance with your desire I give my views and facts in relation to Wyoming, more especially in the workings of the land system and the industries relative to it. I would refer, in the first place, to the circular sent to me by the Public Land Commission, the questions in which I will in part answer to the best of my information. As register of the land office for the eastern district of Wyoming, my jurisdiction extends over one-half of the Territory, or from the eastern boundary of the Territory west to the 103th meridian.

In a residence in the Territory for the past ten years, part of the time in the capacity of a United States deputy surveyor, I have had occasion to visit a greater part of our Territory, and in discharging the duties of my office have become familiar with the views held by the settlers on the public lands, and what would seem to me as injudiciousness in some of the laws relating thereto. In Wyoming, where the greater part of the land is of such a character as to be classed as desert land, it strikes me the requirements to obtain title should not be as stringent as in more populous and fertile States, for the land at best in these thinly settled regions cannot be worth more than the government asks; yet the settler, to procure a title, even at the price, is put to a large amount of trouble and expense, especially in making his final proof. He must bring two witnesses, sometimes several hundred miles, to certify as to his improvements. He must advertise his intention to make final proof and name a day after the expiration of thirty days that he will be at the land office with two specified witnesses. It often occurs that the witnesses specified cannot be obtained at the time named, or are unable to go perhaps a hundred miles or more to some officer before whom their depositions can be taken, thereby laying the applicant liable to delay and fresh expense in procuring other witnesses and advertising.

The desert act of March 3, 1877, meets a great want, inasmuch as the settler can perfect a title on unsurveyed land, for a greater part of our Territory is as yet unsurveyed, and with the small appropriation doled out but little progress takes place each year. This law gives an impetus to settlement, whereas under previous laws the settler was loath to make permanent or costly improvements on land to which the title was indefinitely postponed. Yet there is in this, like the other laws, a common and just complaint against the stringency required on final proof. One of the principal features in the physical structure of our Territory is the small amount of first or bottom land proper. Our streams coursing along the prairie cut deep, and the generally very narrow and irregular strips of bottom land are hemmed by higher bench lands or chains of rolling bluffs, so that a claim of 640 acres must necessarily be made up in a great part by these higher lands, to which irrigation could not be brought, which would fail in a compliance to the letter of the law. All of these lands, outside of a small portion bordering on streams, are of no utility but for grazing purposes. The grasses, of unsurpassed nutritiousness, depend for growth mainly on our late snows and spring showers. Oftentimes our dry seasons give but a scanty growth ere the curing process commences, stunting growth and yielding a scant supply of feed. And for this class of land, with its one redeeming trait, stock-feed, it seems to me government receives a very full compensation, the dollar and twenty-five cents per acre, without making requisite the full irrigation of the tract—in fact, an impracticable demand in many cases. Say, require the irrigation of one-quarter, or 160 acres, and I think the law would be of more equal satisfaction, and the government obtain the full value for much more land. In regard to the final proof required upon this class of entries I have often heard men say, "If I have to answer all of those questions I will let the land alone, for it is not worth over one dollar and twenty-five cents per acre after I improve it." Parties have said to me that they had rather buy of the settler that had obtained a patent for land than to fulfill all the requirements of the laws; yet these very men were probably contemplating the erection of several thousand dollars' worth of improvements. But their residence was in some town, distant from the land, and they did not want to fulfill the requirements of the homestead or pre-emption law by living on this land, merely to be granted the privilege of paying to the government the full value of the land.

The pastoral homestead law, yet one of the things to be, I should judge 90 per cent. of the stockmen would fervently wish it to remain in that innocent condition for some future generation to give it the breath of life. If by the wish of the stockmen it is to be it will never become a law. Only a few hours since one of the most prominent of our sheep men said, "If the law passes my sheep business is over, and it will be my first endeavor to sell out." I understand from conversing with them that the most prominent of our cattle men are also strongly opposed to the law. A meeting has been called by the secretary of the stock association for Tuesday evening, November 18, to discuss this question, and the opinions as gathered I will add to this before it is mailed.

I believe the present system of public-land surveys is as perfect as it can be made, with the exception of a few more requirements by the surveyors-general as regards the marking of lines and a more careful and frequent inspection to see that their instructions are complied with and the work carefully done. I am fully convinced that the surveyors-general should have a practical knowledge of surveying, for at present many of the offices are filled by men who have not the most shadowy idea even how to conduct a government survey, and in the smallest particulars have to depend entirely on the greater competency of subordinates. In the case of most of the surveyors-general a personal inspection of the work of their deputies would not enlighten them to any great extent, particularly as to whether the lines were properly run or not. The deputy, therefore, has nothing to inspire him to good work but his own conscience.

Registers and receivers should receive a salary of not less than \$1,500 to each, and should by all means be allowed office rent, fuel, and incidental expenses; abolish fees, may be, except in contested cases, when the officers should be allowed as much as now, or more, for reducing testimony to writing. In most cases the amount allowed is hardly sufficient to pay a stenographer or clerk, whose services on such occasions are most urgently required.

Patents for public lands should issue in the regular order in which final payments are made, and should be returned to patentee, after final papers are perfected, with more promptness.

More prompt attention should be given by the department to communications received from the registers and receivers.

Expired filings of all kinds should be canceled at the expiration of one year after limitation of same, and not, as now, compel the second filer to obtain the relinquishment of a filing that has been dead by limitation perhaps two or three years.

In regard to the felling and removing of timber upon the public lands, I think the stumpage law as it is should be modified so that the rate for railroad ties should be doubled and the restrictions upon the chopping of cord-wood removed. Make a penalty for using green timber for such purposes. By such a law the timber land would be cleared of all fallen timber, with which our hillsides are covered, and thereby in a great measure prevent the spread of fire, which is so destructive not only to large timber but to the young trees that are everywhere springing up along the mountainsides. The choppers, as a rule, use only dead and fallen timber for cord-wood, as it is much lighter to haul and more preferable to the consumer.

Very respectfully,

GEORGE R. THOMAS.

THOMAS DONALDSON, Esq.,  
*Commissioner on Public Lands, Philadelphia, Pa.*

## APPENDIX A.

---

### ADDITIONAL TESTIMONY RECEIVED BY THE PUBLIC LAND COMMISSION SINCE DECEMBER 15, 1879, AT WHICH DATE THE PRINCIPAL MASS OF TESTIMONY WAS SENT TO PRESS.

*Testimony of R. C. Hopkins, Tucson, Ariz., on the Spanish laws of 1761 and 1789, relative  
to irrigation in the western provinces of Mexico.*

TUCSON, January 4, 1880.

DEAR SIR: Your note of inquiry just received. The general regulations for the measurement of water, published in 1761, declare:

That the *regalia*, according to the common and rigorous acceptation of the term, is the right of eminent domain, which pertains to the monarch, in properties vagrant, shipwrecked, intestate, waters, lands, and mines; and that, therefore, the prince alone has the right to distribute the waters.

In 1789 instructions were issued by the comandante general of the western province of Mexico for the establishment of the new pueblo of Petic (Hermosillo) in the province of Sonora; which instructions were to be observed in the establishment of all pueblos within the jurisdiction of the comandancia general, which jurisdiction embraced all the western provinces of the vice-royalty of Mexico, including California. These instructions were approved by the King and direct as follows:

ART. 6. The tract of four square leagues granted to the new settlement (pueblo) being measured, its pastures, woods, water privileges, huntings, fisheries, stone quarries, (fruit) trees, &c., shall be for the benefit of the Spaniards and Indians residing within the territory measured off.

ART. 19. Irrigation being the principal means of fertilizing the lands, and that which most conduces to the increase of the settlement, the commissioner (appointed for that purpose) shall take particular care to distribute the waters so that all the lands susceptible to irrigation may partake of the benefits thereof, especially during the spring and summer seasons when irrigation is most required, in order to insure good crops, for which purpose, availing himself of the services of skillful and intelligent persons, he shall divide the territory (to be irrigated) into districts, marking out to each one a trench or ditch, starting from the main source, which may carry sufficient water for the irrigation of the tract for which it is intended, in order that each settler may know the ditch by means of which his tract of land is to be irrigated, so that he cannot and shall not have the power to take the water belonging to another, nor a greater quantity than may belong to his tract of land.

ART. 20. In order that the settlers may enjoy equitably the benefit of the waters, in proportion to the need of their crops, there shall be named annually, by the ayuntamiento (town council), one alcalde, or "mandador," for each water ditch, in whose charge shall be the distribution of the water to the different tracts to be irrigated, in proportion to the necessities of the lands; the alcalde to publish a list of the owners of the lands to be irrigated, and the hours of the day or night at which the respective tracts were to be irrigated; to the end that, from the carelessness or indolence of the owners, lands might not be without irrigation at the proper time, which, besides working private damage, would result in an injury to the community. To avoid this the alcalde of each water ditch shall keep a peon or servant, who, knowing the hour of the day or night designated for the irrigation of each tract or corn-field, shall, when the owner fails to do so, take care to irrigate the tract at the proper time; for which labor he shall be paid by the owner of the tract irrigated the just value of his labor, the sum to be regulated by the commissioner or by a judicial officer.

ART. 21. The repairs and cleansing of the main ditch to be at the expense of the community, and this work to be done at such times as the commissioner and town council may designate, each settler giving his personal labor toward the same, or paying a reasonable assessment.

The foregoing instructions and regulations are based upon laws from time to time passed for the government of the Spanish Indies.

In arid countries, such as a large portion of Spanish America, water for purposes of irrigation is an element of the greatest importance; hence, the laws of Spain in relation to the use and distribution thereof were exceedingly exact and stringent. The

use of the water belonged to the riparian lands, which could not be deprived thereof. It was an element pertaining to the land of which it could not be divested, the use and distribution thereof being under the control of officers appointed under the law, whose duties were to see that each tract of irrigable land received all the water to which it was entitled; and even when the owner of the land neglected to supply the same with water, the land received it through the ministration of guardians appointed for that purpose.

Very respectfully, your friend, &c.,

R. C. HOPKINS.

J. W. POWELL, Esq., *Washington.*

*Testimony of C. Bielawski, draughtsman, surveyor-general's office of California, San Francisco, Cal., relative to present system of surveys, contract system, inspector of surveys, set of surveys, townships surveyed, permanent monuments, Spanish grants, Mexican grants, triangulation survey, and topography.*

C. BIELASKI, draughtsman United States surveyor-general's office of California testified at San Francisco, October 16, 1879, as follows:

I was a military engineer until 1871, when I came to this country.

Question. Give us your ideas of what should be done to make more perfect the present system of survey, and what methods you would devise to make more accurate topography and definiteness of description.—Answer. From my experience I am led to believe that by following and properly executing the instructions of the present system it would give a sufficiently accurate result in every respect, both as to surveying and topography. I believe that in running around a square mile of country a surveyor would have plenty of chances to get a distinct topography of that one square mile.

Q. What do you think as to abolishing the contract system and substituting a wage system?—A. I think that would give better results, but it would be at least three or four times more expensive than at present. I would suggest the keeping of the present system under better control. I would control it by an inspector or inspectors of surveys, who would inspect the work before it is paid for. I believe it is so in the English system. He should not be amenable to the surveyor-general, but should be an independent officer.

Q. Do you think the present prices adequate?—A. I do not think the present price adequate in some parts of the country. In the mountain ranges it is not. The surveyor-general can order a higher price if he thinks it is best.

Q. Do the exterior lines cost more than the other lines?—A. The government allows two prices, and the higher prices are not adequate in some tracts. In large tracts, all together, the surveyor might do well; but if a man has to go to the expense of preparing to survey a single township, it is very seldom that he will make any money out of it.

Q. How many townships have been surveyed in California?—A. I should say 3,000.

Q. Out of those 3,000 townships, do you know how many of them are settled?—A. Well, I should say that two-thirds are partly settled, and the other third perhaps not.

Q. Are these 3,000 townships subdivided?—A. A good many of them; a good many of them on the borders of streams have been subdivided, wherever valuable land has been found.

Q. Don't you think the surveyor should be permitted to give all possible information to settlers?—A. I should think so.

Q. What can you suggest in regard to more permanent monuments or stakes or distinctions of any character to make surveys more permanent; and is not there a necessity for more permanent monuments?—A. We have here surveys made twenty-five or thirty years ago, and when surveyors now go there, they can trace all the lines very well. That is, on the plains and mountain lands, we have surveys north and south, and if properly executed, they will last thirty or forty years. Some corners have been mischievously destroyed, but if properly executed, I believe the surveys would last a long time.

Q. Have you had charge of making the maps of the Spanish grants?—A. I am not chief draughtsman. I used to have charge, but I have not now.

Q. Do you know of any of these grants having grown in a night over the original grant of the alcalde? Have they enlarged and any exterior lines been taken in?—A. I cannot answer of my own knowledge. I have heard of some such things.

Q. Do you think that this question of Mexican grants should be settled?—A. Yes, they should be, but I don't think there are many left unsurveyed. In fact, I think very few remain unsurveyed. The government ought to confirm the titles at once and get rid of the whole subject.

Q. Have you any further suggestions to make? For instance, would you not put a

clause in the law to authorize triangulation if it was, in the judgment of the surveyor best to use it?—A. They are allowed triangulation now. If the United States would make an accurate triangulation survey and let the United States land surveys be connected with it, I think it would be well, so that we could make a good map of the United States. The deputy surveyors are allowed fifty chains per mile, by way of mistakes. By having connections with real good triangulation points those errors could be discarded and a very good and useful map be made of the country; but as to the present system, I consider that if they are surveyed by solar compass in a good, faithful way, I think our surveys can be made very nicely. I believe it is not the duty of the United States to furnish an exact topographical map, but to plainly subdivide the lands by lines, so that every farmer and settler can go there and hunt up the land he wants and occupy it. As to further improvement in the topography, it is the duty of the State to do that. We have here in this State very nice county maps. These maps will be made in time everywhere when the country is settled. Just as it is the duty of the State (to whose interest it is to know all its resources) to make geological and valuation surveys, so it is the duty of the general government to parcel the land for sale with topography enough for identification.

*Testimony of Charles W. Cross, attorney, Nevada City, Cal., on lode claims and placer claims.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. Charles W. Cross, attorney, Nevada City.
2. Seven years.
3. No.
4. A considerable practice in obtaining United States land patents.
5. Mineral patents from one to three years.
6. From one hundred to four hundred dollars, besides price of land.
7. Mountainous. Mostly mineral and timber lands.
9. The present system is good enough.
10. The desert-land law should be repealed.

**LODE CLAIMS.**

1. Several years of active practice in mining litigation and patents.
2. It is a very common complaint that applications for mineral patents move too slowly in the department at Washington.
3. The present practice is probably best calculated to protect all parties in interest, and has caused no trouble in this vicinity.
4. The apex of a vein is the vein at the surface. When a lode has been developed sufficiently to show its worth, locating those facts can be sufficiently determined for ordinary purposes of location and record.
5. The present law as to locations works well; it would work better if more particularly observed.
6. No. It prevents both litigation and injustice, as it makes floating of claims quite impossible.
7. Yes; but under the present law the rights of the respective parties are easily determined.
8. No; not under the act of Congress.
9. Not in this vicinity, but 600 feet in width often includes several distinct and valuable ledges.
10. Seldom.
11. Don't know.
12. Have never known of such a case.
13. Not in this vicinity, under the act of Congress. When such litigation arises, it is usually from claims dating prior to the act of 1866.
14. That is the most important provision of all; the reasons are obvious to those who are well acquainted with lode mining.
15. No.
16. Stake off or mark boundaries, post and record a notice clearly defining the location and boundaries.
17. No.
18. Not where the records are kept with other land-title records. Local mining records are liable to much abuse.
19. All local mining-district laws should be abolished, but the records should be in

the county recorder's offices. It would be inconvenient to have the records at United States land office, on account of the difficulty encountered by persons at a distance in examining them.

20. No. These rights are very difficult and complex, and need juries and the best judges for their determination.

21. The right to raise ventilating shafts under proper restrictions from the dip of the ledge through adjoining ground would be a valuable amendment.

22. Have not considered this subject fully.

#### PLACER CLAIMS.

1. A large proportion being deposits in what are called ancient river-beds or channels in quartz gravel.

2. Yes; by several years of active legal practice in that kind of business, from \$100 to \$5,000 with contest, the difference in contested cases being chiefly attorney's fees in local courts.

3. From \$50 to \$300, besides price of land, without contest.

4. The general law not requiring, well-defined acts to evidence of possession, &c.

5. Defective in maintaining boundaries and making improvements.

6. There should be some reasonable limit to the quantity which can be acquired or held by any means by one person, corporation, or copartnership.

7. No; all placer mining claims should become public lands if no valuable improvements are made during any period of five years.

8. No; not since 1872.

9. No. But parties owning outlets on mineral lands frequently are very unjust in their exactions. The Congress should pass laws concerning easements and drainage and water rights for mining purposes, and all patents for mineral lands thereafter issued should be subject to such conditions.

---

*Testimony of C. D. Davis, land surveyor and civil engineer, Fresno County, California, and H. S. Patterson, Fresno County, California, on agriculture and timber lands, mining and pasturage lands.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. C. D. Davis, Fresno County, California, land surveyor and civil engineer.

2. Twelve years in the county, thirty in the State.

3. Yes, under the homestead law.

4. Have witnessed the settling up of a new country and have been called on often to survey and get numbers for settlers, &c.

5. Time, three to four days; expense, \$30 to \$50, in uncontested cases; in contested cases, costs up to bankruptcy. We are thirty miles from a land office.

6. The laws are good, and without perjury the government cannot be wronged. (There are already laws for perjury.)

7. Rough mountains, low or foot hills, and level valleys, comprising all the different kinds of land in the question.

8. There can be no general rule nor geographical division. It can be best fixed by the reports of surveys. It fixes itself in part by the density of the population, where it remains sparsely settled after a reasonable time has elapsed to settle it.

9. No need of changing the present system except so far as to allow settlers to locate by sections on pasture lands, always reserving the right to the mineral to the miners. Timber land should be sold with a limit on the amount that any one man or firm could hold. Valley lands are already owned. My reasons for selling the timber is to protect it. Government cannot do it as well as the individual. Pasture lands should be in quantities sufficient to support a family by passing title to the settler. He could not be eat out, but could stock his range so that there would be no danger of losing his stock from want.

10. There can be no better system except as to pasture lands, and there the system simply wants enlarging.

#### AGRICULTURAL.

A little too hot for comfort through the summer in the valley, but by climbing the mountains can get anything you want. Rainfall rather light; average not more than 10 inches. Length of season nine months; many places not frost enough in the other three to kill orange-trees. Snowfall—none in the valley, and very little below 2,000 feet altitude, and not heavy until about 4,000 feet. Water supply without limit.

all we want through May and June (when we need it most). Sometimes an overplus six or seven months in the year.

2. Rainfall: The greater part in December and January. March often gives us a good rainfall. The supply from the melting of the snow is what we rely on for irrigation.

3. Successfully, but a small proportion.

4. About one-fifth.

5. Almost everything; but the country is settling principally on wheat, alfalfa, and fruits, (mainly grapes). Egyptian corn, though, is growing in favor very fast, and promises to be a leading crop in a few years. Raisin culture has proved a great success.

6. About 12 inches. This amount put on the land at any time will secure a crop.

7. The snows of the Sierras are our main dependence; they acting something like a reservoir, and melt almost exactly as our wants call for, and come down to us through the Joaquin and Kings Rivers.

8. I have had fifteen years' experience in irrigation, and must say that, with judicious handling, the fertility of the soil is greatly enhanced by irrigation. I have known good potatoes (Irish), cabbage, beets, parsnips, turnips, and barley raised at an altitude of five thousand feet, but think this the limit of cultivation.

9. All used; none returned; no restrictions except the State law, that requires canal owners to put the water to some practical use in order to hold their riparian rights.

10. Through the flood season (May and June) not more than one-fifth, by incorporating and locating under the State laws.

11. A little in regard to riparian or prior rights, but the main contests have been for rights of way and disputes inside of companies.

12. Three million five hundred thousand acres.

13. Yes, on all the foot-hill pasture lands, not less than five sections.

14. I would put them on the market for homestead purposes only, and forbid the cutting of oak timber until the expiration of the five years.

15. To rely entirely on the pasture it would take 40 acres to the animal. I do not think our lands furnish as much feed as lands farther north or nearer the coast either.

16. Fifty to one hundred.

17. About 12 head; but a small proportion, however, are on our pasture proper, four-fifths being in the valley.

18. The quantity remains about the same, but some kinds are dying out.

19. But little fencing on what we are denominating pasture lands. Do not believe it would pay to fence them.

20. Could not say.

21. Streams and springs mainly.

22. Five.

23. Except where overstocked it remains about the same. Changing a little in kinds; for instance, bunch-grass is in many places entirely destroyed.

24. Not well; if left to themselves will separate themselves.

25. I know of but little of late years between cattle and sheep. But sheep men are falling out constantly about the division of the public range.

26. Cattle about 30,000; seldom herded sheep; 300,000 herded in bands of about 2,000.

27. None other.

28. None where charcoal was deposited; where charred posts were used I sometimes have a little trouble.

#### TIMBER.

1. Timber of some quality grows over a large area, but timber lands easily accessible are scarce, the whole county not having over 150 sections, i. e., timber fit for milling. The milling timber is fir, sugar and yellow pine.

2. Australia gum trees, lombardy poplar, locust, and walnut. The planting is just commenced; too soon to give results.

3. Sell them not more than one section to any one firm or man. This would prevent monopoly, for I would not allow them to acquire more than that from any source; and I would sell them so cheap that it would be cheaper to buy than steal. I stated before that I thought private ownership was the best protection the timber could have.

4. The only classification I would make would be to set off the milling timber. The rest would all go as pasture lands.

5. Yes; it springs up immediately, grows rapidly, but would take about two hundred years to mature if you let it alone. The principle of the fittest surviving is seen in this. The young timber comes up very thick; no possible chance for one in a hundred to make a tree for want of room. Of course, in the struggle the strong must be greatly retarded in their growth. The oldest pines here are less than 400 years old.

6. Fires generally start from the Indians, but are seldom very destructive here, at least not in comparison to fires in Oregon. The best prevention is for private owners to guard them.

7. Nothing more than that they are heavy. Shake men often throwing trees 4 to 7 feet diameter, and if it splits a little tough, leave it to rot while they hunt a better splitting tree. Saw-mill men, too, cut nothing but the clean trunks (comparatively). Competition being sharp, they are compelled to make an extra quality of timber, and as the timber costs them nothing (stealing it from government), they slash away. The main use here is for building and agriculture. (Private owners are the best guards.)

8. Everybody cuts that wants. The man that throws the tree owns it, and generally sells it to the consumer.

9. Of course it would be an improvement on the present plan, but not so good as interested guards.

#### MINING.

Question 1. Everybody that has been here thirty years has had more or less to do with mines; but taking the whole thing together, I think the best way would be to let the prospector get a survey and own all of his 20 acres vertical, compel him to pay for it, and give him a deed. This, I believe, would end all trouble, as it would prevent overlapping and give him all his location. I would let him locate to suit himself, i. e., would let him locate so that the east lode would be on one edge of his survey, if he so willed.

Respectfully, yours,

C. D. DAVIS.

ADDENDA.—One word in regard to pasture lands above an altitude of 5,000 feet. These should have both the mineral and timber reserved; the timber, though, will never be needed except for mining, the way it is situated.

1. H. S. Patterson, Borden, Fresno County, California.

2. Six years, and State ten.

I corroborate with the above, except in answer to question 14, under the head of agriculture. The foot-hill lands should be sold in tracts not to exceed 320 acres to one man or farmer, and he should be a *bona fide* owner of land in the valley.

All of which is respectfully submitted.

H. S. PATTERSON.

*Testimony of Peter Decker, of Marysville, Cal., relative to the amounts expended in consequence of the filling in of rivers by tailings from mines.*

MARYSVILLE, CAL., January 5, 1880.

DEAR SIR: Absence from home and a press of business have delayed my promised report as to amounts expended here in consequence of the filling in of our rivers by tailings from the adjacent mines. The necessity for levees arising from this cause was made apparent before 1868, up to which time there was expended on levees about \$30,000. In that year a system of levees for this city was adopted, and the cost of construction was \$30,500. In 1875 the levees broke and our city was inundated to the depth of 3 to 5 feet, destroying property to the value of \$500,000. During that year the city expended on levees for its future protection \$105,000. In the year just past (1879) the city extended its system of levees at a cost of \$50,000. Our system of sewerage has become nearly useless on account of the raising of the river bed, leaving no outlet. It cost \$15,000.

The filling in of river beds and consequent overflow of the surrounding country has necessitated the construction of elevated roadways and expensive bridges, which have been constructed at a cost of \$120,000, and which, like levees, require heavy outlays annually for their preservation.

The county (Yuba) has spent in addition to the foregoing on levees and bridges \$96,500, in consequence of the filling up of the streams, and, after all, our protection is inadequate, and will be totally so within a few years unless hydraulic miners are prevented from running their tailings into the streams. The adjoining county of Sutter has doubtless spent as much or more than Yuba for similar uncertain defense, and other counties and districts not less. Thus large districts in the Sacramento Valley, including cities and towns, have been injured in property until they feel there is little protection, and a certain demoralization will ensue where the authorities are incapable or neglect to protect property. The disastrous effect on this city (eligibly located) is shown in the fact that in 1860 our assessment roll was \$4,540,000. In 1879 it was \$1,896,000, and that, too, on a high rate of assessment.

I am, very respectfully,

PETER DECKER.

Maj. J. W. POWELL,  
Public Land Commission, Washington.

*Testimony of Rudolph Klotz, farmer, stock-raiser, &c., Shasta County, California, on agricultural and timber lands.*

SHASTA COUNTY, CALIFORNIA,  
December 12, 1879.

*To the honorable board of Land Commissioners,  
Washington City, D. C.:*

My name is Rudolph Klotz; residence, Klotz's Mill, Shasta County; occupation, sawmill, sash, door, and blind factory, farming, butchering, and stock-raising. I have lived in Shasta County, of this State, twenty-nine years. I have bought offered land direct from the general government. I am well acquainted with the United States and State land laws. The public land now remaining in this State is timbered land, grazing land, mining land, and a very small portion of agricultural land, in this county or State. The general grazing land is very poor; the land in the foot-hills and valleys, after the month of May, dries up so it is not fit for grazing during the summer. Nearly all the stock men have to move with their stock to the mountains during the summer and return again in the fall season. For that reason I think the public grazing lands of this State would not be beneficial for homesteads, for the reason it being so poor it would require a very large quantity for a man to make a living on it alone. From the above-stated facts, in my opinion, it would be best for the general government to sell such land to the highest bidder in unlimited quantities. In regard to sheep-grazing, sheep and cattle will not graze on the same land. Sheep will drive the cattle off. Sheep grazing continuously on the same land will destroy the grass entirely. From the fact not having any rain on an average for six months in the year, all our grass comes from the seed; and sheep being a close feeder, but very little of the grass goes to seed, and what does go to seed the sheep eat the seed.

In regard to timber land, the timber land of any value is located on the Sierra Nevada Mountains, running the entire length of the State, and on an average of ten miles wide. The character is sugar pine, yellow pine, fir, and cedar. The timber in the foot-hills and valleys is principally oak, and only fit for firewood. The majority of the best timber for the manufacture of lumber has been cut, having been cut by all the mill men and board and shingle makers, there not being any law whereby the mill men and shingle-makers could procure a title to the timber, consequently they cut the timber without paying the government for it. If not got in that way, we would have had to live in tents or import lumber from some other country, the law that was passed at the last regular session of the United States Congress, only allowing a man to purchase 160 acres of timber land at the rate of \$2.50 per acre; in my opinion the quantity of land is not sufficient for mill men. It will not pay any man to erect a mill for the manufacture of lumber for that amount of land. In my opinion it would be to the interest of the government to sell the timber land of California to the highest bidder, and in unlimited quantities; and at the time Congress pass a law (and be particular to strictly enforce it) to charge so much per thousand feet on and after a certain date for all timber that is cut on public lands. In that way it would make no difference to the manufacturer, for he could charge the same amount extra on the manufactured work that he had to pay for raw material; in that way he would not encroach on the government. The sale of timber at \$1 per thousand would pay the expenses of collection and leave a balance of more to the government than any other way. The timbered land could be disposed of if it was not for fire. I would recommend the sale of the timber altogether, and not the land, for in an early time, before the country was settled by the whites, the Indians burned the timbered country every year, but since that time accumulation of rubbish from the growth of vegetation is so great that when a fire runs over the country and through the timber it destroys most all the timber. I have been in the mill business in manufacturing lumber for twenty-eight years, and consider myself as well, if not better, posted than any other man in the State on the timber questions. Everything that I have stated in the above I have done from my own personal knowledge and experience. I am very sorry that I did not see the government commissioners when they visited this county, as I could have given them more information orally than I can by letter. As to mining land, I have but very little knowledge.

If you wish any reference to me, I refer you to Hon. Newton Booth, United States Senator from California.

Yours, truly,

RUDOLPH KLOTZ.

*Testimony of P. C. Scott, land and abstract agent, Red Bluff, Cal., on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. P. C. Scott, Red Bluff, Cal., land and abstract agent.
2. Twenty-two years.
3. Have acquired titles to public lands under most of the acts of Congress permitting such acquisition.
5. Depends on distance from local office and character of location. Actual homestead entries requiring the presence of settler at land office to make filings, necessitate a cost to such settler of say \$30 more than pre-emption filings. A contested case is generally at an expense of about \$75 more than non-contested.
6. The operation of United States land laws gives general satisfaction to actual settlers.
7. County of Tehama; total area about 2,048,000 acres; about one-fifth is susceptible of cultivation; about four-fifths are grazing and timber lands. No mineral lands in Tehama County; and timber lands are of but little value.

**AGRICULTURE.**

1 to 11. Irrigation is unknown except for minor gardening purposes; the farming portion being tropical, would not be inhabitable by the Caucasian race if generally irrigated.

12. Fully four-fifths.
13. Yes; not less than 320 acres, and would induce considerable settlement.
14. Would be advisable in perhaps two years hence, by which time every acre in any way susceptible of cultivation will have been occupied by settlers.
15. Estimate at three acres.
16. From one hundred upwards.
18. Diminished.
19. No.
23. Very much diminished.
24. No.
28. No.

**TIMBER.**

1. A limited supply of pine and fir in some mountains.
2. None planted.
3. Am very positive in asserting that timber lands should be sold in tracts of not less than 320 acres, at a price varying according to the estimated stumpage thereon.
8. Local customs are, to indiscriminately take possession of, manufacture lumber and destroy forests.
9. Yes.

**LODE CLAIMS.**

None in Tehama County.

**TEHAMA LAND AND ABSTRACT COMPANY.**  
P. C. SCOTT, *Agent.*

*Testimony of E. D. Bright, Trinidad, Colo., on agriculture and timber, lode claims, and placer claims.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. E. D. Bright, Trinidad, Colo.
2. Ten years.
3. Have pre-empted one claim.
4. None.
5. About one year until patent issues.
6. No.
7. All kinds, including coal.
8. By geographical division in this country.
9. Am unable to give good suggestions.
10. Know no better.

## AGRICULTURE.

1. We are getting more rain and snow each recurring year.
2. Snow, winter and spring; rain, June and July.
3. None.
4. Any land that can be covered by ditch.
5. Corn, wheat, oats, barley, and all vegetables.
6. About one foot.
7. All streams supply good in county.
8. Know of no injury; crops raised at 8,500 feet in this section.
9. Cannot answer.
10. State laws.
11. Mainly regarding work to be done on ditches.
12. Almost all the eastern part outside of river bottoms.
13. I think so, but a large allotment should be made as many have large numbers of stock.
14. Put in market unlimited.
15. Can't say. Eastern part of country excellent for cattle.
16. Don't know.
17. Do not know.
18. Increased where sheep have not been.
19. Ranges are never fenced, except natural cañons.
20. I think so.
21. Streams and springs.
22. Don't know.
23. Diminished on account of tramping.
24. No.
25. Many on account of cattle refusing to graze where sheep have been.
26. Don't know. Number of sheep generally 2,000.
27. None.
28. In some places.

## TIMBER.

1. Good pine timber everywhere west of eighth guide.
2. No timber planted as yet except cottonwood and box-alder.
3. Sale or lease, as saw-mill men cut all over the country and do not pay one cent for the privilege; I speak of this section.
4. They are generally the same here.
5. Could not answer definitely.
6. Indians and campers.
7. It has been universally here very destructive; have tried to stop it without success.
8. They all help themselves to any timber, cutting only the best.
9. Very certainly.

## LODE CLAIMS.

1. None.
2. Know of none.
3. Ignorant of this.
4. Outcrops generally.
5. Can't say.
6. I think so.
7. Yes.
9. Seldom.
10. Yes.
11. Don't know any such case.
12. I think not.
13. I have only heard of such case.
15. No.

## PLACER CLAIMS.

1. About 600 square miles, bituminous coal.
2. No.
3. Don't know.
4. Cannot.
5. I think not.
7. Never heard of any such case.
8. Not to my knowledge.
9. No.

*Testimony of John Curr, Colorado Springs, Col., stock raiser. (Abstract.)*

"Would suggest that all non-mineral land be offered at \$1.25 per acre for six months, then reduce the price to \$1 per acre for the next six months, then successively at intervals reduce to 75, 50, 25, 15, and 10 cents." He believes "it would be for the interests of the United States, and more especially of Colorado, to sell land in unlimited quantities at some such scale of prices as the above, the purchasers being their own judges of value." It would require from 2,000 to 4,000 acres of pasturage land to support a family. Much land is being fenced which belongs to the government, the parties fencing being the owners only of springs.

"Timber culture would not be practicable here." He advises that the government "sell timber lands at auction to the highest bidder." It is common to enter a claim, cut timber, and dispose of it, and then abandon the claim.

*Testimony of John George Haas, stock raiser, Pueblo, Pueblo County, Col., on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

PUEBLO, COL., November 29, 1875.

*Department of the Interior, Public Land Commission,  
Washington, D. C.:*

GENTLEMEN: The list of questions you sent me some time ago I have received and am ready to answer on some of them to-day.

My name is John George Haas; my residence is at a place called Chico, Pueblo County, Pueblo, Col., and my range is situated on southeast quarter of section 11 township 19, range 63; my occupation is stock raiser, and have been living on the same place above mentioned since the month of July, 1863, without any change. When the land was surveyed I went by the instruction of the surveyor by paying \$206. I received one year after the patent for 160 acres of land—what they call pre-emption law. Then, through the same surveyor's information, I ask for the patent of homestead which I could receive by paying \$19 and living on the same for five years. I did so by proving up and paying \$10 more, about eight months ago, and have now received the patent yet.

In my section the land is very poor, scarce of water and timber. It is not fit for any other use than for pasture. On account of scarcity of water I don't think that the Congress would have any benefit by holding the land out of the market. The sooner it will come into private hands the better it will be for the county and State.

It is not much more land which would be taken by private entries for homestead as the land itself is not worth much only to those who own the watering place. I think if the land should come into the speculators' hands they would be more apt to get water on to the land where it could be got on to in anywise to receive benefit for their money. It would come cheaper to a man with small capital to buy it from them than to undertake it alone or in company with others.

The climate here is mild and dry. It generally snows very little, hardly ever rains till in May or in June, and mostly with showers. I have seen few steady rains during the time I have lived here, but it wouldn't pay to plant any kind of crops on account of it. The rains here do not help the crops much at any time. The crops are generally raised by irrigating from the streams, and good portion of the land; what cannot be irrigated don't pay to work it, as the land is poor. Where the ground is not level the land cannot be irrigated, and where the water has to be led a good ways a good deal of it disappears into the ground before it comes on to the land. By my experience very little water returns to the streams if taken out of the same.

The water during irrigating seasons is generally used out of all of the streams with the exception of the Arkansas River. The water is taken out by ditches made by one, two, or more land owners. Nine-tenths or more of the land can't be used for anything else, except for grazing purposes, and good portion of it nothing will grow on.

By my experience I think it will take at least from 15 to 20 acres of land to keep one head of cattle a whole year round. For my family use I generally kill from 20 to 25 head of cattle a year.

At the present time a good many cattle raisers fence in the lands to protect the grass for winter. Fences were not tried long enough in this section of the county to tell whether they will hold cattle during the bad storms. If cattle is in fences the owners will try to improve the same for their own benefit, otherwise cattle run.

at large none of the owners will try to improve the same, as the neighbors would get benefit through it.

The supply of water for the cattle comes from springs which are owned by the stock raisers. The cattle runs at large in big herds.

I have never heard of any trouble of surveying corners, but think the time will come, as the corners are marked by small sticks and some of the numbers on them are to my own knowledge wrong.

The timber in this part of the country is cottonwood, but very scarce, and grows only on streams which are already owned or claimed up. I live far from solid timber lands, and have no knowledge about it, and yet less knowledge I have about lode claims or placer claims. If any further information is necessary I will answer as near as I can.

I remain yours, truly,

JOHN GEORGE HAAS,  
Pueblo, Col., Box 202.

*Testimony of V. V. Banus, attorney at law, Oakwood, Brookings County, Dakota.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. V. V. Banus, Oakwood, Brookings County, Dakota; attorney at law.
2. One year.
3. Have taken a tree claim and homestead.
4. Have had more or less practice in cases involving land disputes and settlements.
5. One hundred dollars for homestead, or \$300 for commuted homestead or pre-emption. In contesting cases claimants are put to additional expense of from \$20 to \$50 in *ex-parte* cases, and from \$20 to several hundred dollars in other cases.
6. See no reason why officers at local land offices should not be empowered to make cancellation in cases of relinquishment, instead of waiting for returns from Washington. Compelling claimants to make settlement and residence on land in cases where affidavit for homestead is made before a clerk of the court is a hardship. See no reason why same privilege should not be granted as in cases where land is entered at the land office in person. The men who make the best citizens in a new country are those with families, and it is sometimes, and in fact generally, difficult or impossible to make an immediate residence, and the expense in travel is great, especially in long and narrow districts like those in Southeastern Dakota. Think contestant should have priority in case homestead or pre-emption is canceled under contest trial. Think homestead settlers should have same privilege as to time of making entry as in pre-emption cases.

The above constitutes the material changes that I would suggest. Think the land laws are wise, and, as a whole, well administered. Perhaps the government might be a little more vigilant in the punishment of perjury. The regulation requiring notice of proving up is an excellent one, and operates as a very salutary check to the rashness and perjury of unscrupulous land speculators. Hope the rule will not be set aside, as I understand some are making an effort to have it done away with.

All of which is respectfully submitted.

Respectfully, your obedient servant,

V. V. BARNES.

*Testimony of James G. Boyle, Olivet, Hutchinson County, Dak. (Abstract.)*

A party should have the same right to file before the clerk of a court that he has to file in the local land office, and not be compelled to make actual settlement before filing. More stress ought to be laid upon the improvements on the land and less upon continuous residence. Many settlers find it impossible to occupy the land continuously, because, having no capital or money to start their farms with, they are compelled to hire out for wages in order to procure money for their own improvements. The intent of the law is often defeated by this requirement.

*Testimony of William S. Cobban, editor, Roscoe, Moody County, Dak., on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1 :

1. William S. Cobban, editor, Roscoe, Moody County, Dak.
2. Eighteen months.
3. No.
4. News editorial work keeps them constantly before me.
5. Pre-emption generally proved upon in six months, and then pass into speculators' hands.
6. Pre-emption and timber-cutters acts are benefiting few but speculators.
7. The repeal of these acts and an amendment to the homestead act, making it compulsory on the claimant to cultivate five acres of trees and make final proof only at expiration of five years.
10. Give to each actual settler a homestead of 160 acres, requiring him to cultivate five acres of timber thereon, and to make final proof only after five years' continuous residence, i. e., on prairie lands.

**AGRICULTURE.**

1. Extremes, light ; equally divided, light, none.
2. Spring ; no.
3. All.
12. One-tenth.
13. Six hundred and forty.
14. No.
15. Good as any in the West.
19. No.
20. No.
21. Wells mostly.
22. Six.
23. Increased.
24. No.
28. But little.

**TIMBER.**

1. Scattering timber along Sioux River, of little account.
2. Willow, box elder, and cottonwood. May to October.

*Testimony of Jerry D. Flick, land agent, Rockport, Dak., on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1 :

1. Jerry D. Flick, land agent, Rockport, Dak.
2. Resided in county seven years, in Territory fourteen years.
3. Homestead, pre-emption, and timber-culture enties have been secured by myself.
4. My occupation has given me opportunities to learn the working of the land law.
5. Cost for homestead \$32, except improvements. Time, five years, uncontested case.
6. A notary public should be allowed to make homestead affidavits as well as court clerks.
7. Our lands are well adapted for agricultural as well as pastoral purposes. No timber.
8. The government surveyor, who does the subdividing or runs the subdivisional lines would be the proper person to refer to as to character of lands, &c.
9. Am not well enough posted to give an opinion as to the best method to adopt.
10. The timber-cutting act should be confined to actual settlers of the country & land district. As it now exists, parties from the Eastern States come and enter a tract of land and never come near it again until he wishes to make final proof.

**AGRICULTURE.**

1. Climate very healthy ; sufficient rains for crops ; seasons about as in Illinois ; very little snow falls ; irrigation not required.
2. In spring and summer.
3. All of the Territory of Dakota.

5. None.
6. No irrigation required for wheat.
7. James or Dakota River.
8. I am not acquainted with irrigation; none of the country requires it.
12. One-twentieth part.
13. It is; 80 acres is sufficient for each settler.
14. Not at present, and when it is done the quantity should be limited to 160 acres.
15. Three acres; compares favorably.
16. Three cows.
17. Two head.
18. Increased.
19. We have no fences. Herd law is in force here.
20. I think not.
21. The James River and several small creeks in the county.
22. Five head.
23. Diminished.
24. Not very well.
25. Pastures will be ruined by double pasturing.
26. Cattle, 1,000. Sheep, 3,000.
27. None.
28. A great deal of trouble is experienced by settlers and county surveyors. The United States Government should pass, for use, more stringent laws in regard to deputy surveyors.

## TIMBER.

1. We have no timber.
2. Cottonwood, box-elder, and black walnut.
3. Have no suggestions to offer.
4. Have nothing to offer on the subject.
5. Cottonwood sprouts out from the stump.
6. Usually caused by roving bands of Indians.
9. I think they would.

---

*Testimony of C. J. B. Harris, lawyer and real-estate-dealer, Yankton, Dak., on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. C. J. B. Harris, lawyer and real-estate dealer, Yankton, Dak.
2. Nine years.
3. Yes, about 500 acres, with soldiers' additional rights.
4. Making papers and filing for settlers.
5. Uncontested pre-emption, \$210; homestead, \$25; time, six months' pre-emption; homestead, five years.
6. Yes; contests should be made returnable before some officer of county where the land lies.
7. Nearly all excellent agricultural land in Southeastern Dakota.
8. Class it all arable.
9. Present system needs no change.
10. I cannot suggest any improvement.

## AGRICULTURE.

1. Climate about like Central and South New York; less rainfall and snowfall.
2. In the spring and summer, when most needed; less than farther east, but increases with settlement of the country.
3. All or nearly all.
4. No irrigation here.
5. None.
15. Five acres. Better than in New England or New York.
16. I do not know.
17. About ten.
18. Increased.
19. Do not fence generally. Herd law in force; cattle can be confined with safety by fences.
20. Yes.

21. Average; a great many rivers and lakes; also some large spaces without water.
22. I do not know.
23. I do not know.
24. Yes.
25. I do not know of any.
26. Yes, some surveys are very poorly made and marked.

## TIMBER.

1. Considerable on Missouri River; mostly cottonwood; some hard wood.
2. Walnut, maple, cottonwood, cedar, and pine; rapid growth; cannot state time.
3. Nearly all disposed of about here.
5. Yes, of cottonwood; very rapid growth.
7. Timber on school sections has mostly disappeared; other timber lands entered.

*Testimony of James Holes, Fargo, Dak., on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

FARGO, DAK., September 29, 1879.

*Public Land Commission, Department of the Interior:*

1. My name is James Holes; residence, Fargo, Dak.; occupation, seed-wheat raising.
2. Over eight years.
3. Yes; under the pre-emption law.
4. Thirteen years' experience on frontier.
5. Time, six months to a year; expense, legal land-office fees.
6. In case of death of a land officer, an unnecessary delay in the appointment of a successor.
7. They are agricultural, pastoral, mineral, and timber lands.
8. By an examining commission.
9. One hundred and sixty acres for the agricultural portion and 640 for the pastoral.
10. Six hundred and forty acres pastoral land are a homestead.

## AGRICULTURE.

1. Cold in winter and warm in summer; rainfall ample in Eastern Dakota; snow-fall below the average of Northern States.
2. From April till November; the most in June; least in November. Yes; it comes when most needed.
3. The entire Territory of Dakota.
4. Do not know of any portion that requires irrigation.
5. None.
6. Have never measured the rainfall.
7. Plenty of rain.
8. Don't know anything about irrigation.
9. Never saw an irrigating ditch.
10. Have used no water for irrigating.
11. No conflicts have arisen.
12. About one-fourth of Western Dakota.
13. It is practicable to establish homesteads on pastoral lands and give 640 acres to each settler.
14. It is not advisable for the government to sell these lands at private sales.
15. About 4 acres.
16. Fifty head of cattle.
17. Do not know.
18. Neither one.
19. No, not the regular herders.
20. No.
21. Running streams.
22. About five.
23. Diminished.
24. Yes.
25. Do not know of any.
26. They are herded in herds from 10 to 60.
27. Would suggest that poor surveys be not accepted by the government.
28. Yes. The survey is miserable.

## TIMBER.

1. Fifty-six thousand acres in Cass County, hard wood.
  2. Cottonwood, box-elder, elm, soft maple, butternut, and black walnut, &c.
  3. Charge stumpage on pine lands; dispose of hard wood to the homestead and pre-emption settlers.
  4. Yes; would classify them.
  5. Yes; there is a second growth of timber, which in my estimation should be free from taxation, both timber and land on which it grows, in the prairie counties of the west.
  6. Generally set by Indians or white men; are very destructive. Stringent laws strictly enforced.
  7. Persons or corporations cutting government timber should be made to pay its full value.
  8. They generally steal it. Felled timber is personal property.
  9. Should have local agents to look after government timber.
- Know nothing of lode claims or placer claims.

JAMES HOLES.

*Testimony of H. N. Maguire, Rapid City, Dak., relative to defect, &c., in the working of the public-land laws, homesteads and pre-emptions, desert-land act, timber-culture act, and mineral-land laws, coal, mineral claims and claimants, pastoral and timber lands, surveys, mining records, litigation, mines, mineral-land offices or courts, placer ground, titles, irrigation, agriculture, and land grants.*

RAPID CITY, DAK., December 7, 1879.

To the Honorable Public Land Commission, Washington, D. C.:

GENTLEMEN: Your list of interrogatories regarding the public-land system having just reached me, and the time to answer them in detail, less the seven or eight days required to carry my letter from the Black Hills to the national capital (that it may reach you by the 15th instant), being but a few brief hours, my treatise will not be as elaborate as I could wish, but I shall endeavor to "cover all the ground."

In 1859 I was one of the hopeful thousands who were carried away by the Pike's Peak gold excitement, and since that time I have been engaged in business in Utah, Colorado, Nevada, Arizona, Idaho, Montana, and Dakota, and have been identified with the material interests of the Black Hills of Dakota since the early spring of 1876. It has always been my disposition, and generally a necessity of my business interests, during this experience of twenty years in the far West, to study climatic conditions, mineral and agricultural resources, and the various methods under which government relinquishes its primary right to the soil and regulates its transfer to private ownership.

Detailing practical examples would probably be the most effectual way of exposing defects in our public-land laws and suggesting needed amendments; and as I have had some personal experience in the premises, you will excuse me for including it among the examples I shall give.

1. Some years ago, being at the time engaged in professional business in Bozeman, Mont., I filed in the district land office, under the pre-emption act of 1841, on a quarter section of land five or six miles south of that town. I had a comfortable cabin erected and moved into it with my family. I hired a farmer and fence builders, and sent to New England and New York for small fruits and shrubbery, and within six months from the date of settlement had expended well on to a thousand dollars, besides having given a prior claimant a valuable consideration to relinquish his right at the time I took possession. During the first six months I rode each morning to town to attend to my professional business, returning at night. It was my home, my residence, to all intents and purposes. But when winter approached I removed back to my town residence, and there remained until spring. Then I returned to the ranche, having built a new and more comfortable residence, and employed, as the year before, a practical farmer. My business affairs assumed such a shape that I had to return to town the next summer; and fearing my possessory right might be impaired by the step, and having up to this time paid but little attention to the practice under the public-land laws, I referred the matter to an attorney, who made a specialty of that line of business. "Abandon your pre-emption filing and homestead," he wrote me, "a homestead entry cannot be easily defeated." I followed his advice, and did not get back to my ranche until eight months after, six months' absence being *prima facie* evidence of abandonment, but had a personal representative on the ground most of the time, who occupied the cabin first built; and when I did get back I could only remain on the land with my family four months, when I was again compelled to re-

move to town. So far I had expended in improvements a thousand dollars more than I had realized, and about then (the summer of 1875) I got "the Black Hills fever," and arranged for my family to visit Eastern relatives, while I sought a change of luck in the new Eldorado. At this time I had become too well posted on the principles and practice of the public-land laws to squander any more money on my ranche, and so transferred my improvements under a quit-claim for a trifle. Having relinquished my right under the pre-emption law, to change to a homestead, I was not allowed to resume my rights under the former, the technical ruling being that I had "once had the benefit of the pre-emption law," and I could not prove up under the commutation provision of the homestead law, because I could not prove I had been "residing upon the land continuously for at least six months," and was still a resident thereof; and so I had to leave the land to the next comer, though both my pre-emption and homestead entries had been made in good faith, and I had, immediately following my first settlement, resided upon the land six months continuously, and had expended upon it over a thousand dollars, besides devoting much thought to it and performing no little personal labor. Thus, under the technical rulings, I have exhausted both my pre-emption and homestead rights, and without getting an acre of land. [A settler does not exhaust his pre-emption right by filing an abandonment, as a general rule, but he does under the rulings in the case cited, when he continues on the same tract, changing from a pre-emption to a homestead right.]

2. A poor old settler, named Noah Gee, purchased the possessory right of another homesteader, named Llewellyn, to a tract of land northwest of Bozeman, and immediately settled upon it with his large family, the prior settler having given him a simple untested bill of sale, and then left for parts unknown. A few weeks after the old gentleman came before me, as county judge, and applied to enter the land under the homestead law, and the regular application and affidavit were sent in to the district office. They were returned on the ground that Llewellyn's entry had not been canceled, and that Gee had no regularly witnessed and acknowledged deed of conveyance from him. Then followed a fruitless and vexatious effort on my part to find Llewellyn, to have him execute a deed complying with the technical requirements of the Land Department. The commissioner was appealed to, the facts proved by affidavit of the settler having paid all his money to the former occupant, of his having settled upon the land with his family, and of the unavailing efforts that had been made to ascertain the whereabouts of Llewellyn; but the answer came back that Llewellyn's entry could only be canceled through the forms of a regular contest; and while Gee's attorney was engaged with the case, notice came that the Northern Pacific Railroad Company's indemnity lines had been fixed by their filing in the Interior Department the selection of their route, and the line in dispute being on an odd section it was held to be "railroad land," though the iron track was still 500 miles away in a straight line. This left Llewellyn, who had sold out and left the country, the only adverse claimant of record to the railroad company. When I left that section, it seemed to be inevitable that the old man would lose both his purchase money and improvements. I afterward learned that he died on the tract, leaving as his only legacy to his children the fruits of hard work performed on land to which another had the legal title. [Those lands were afterward restored to settlement.]

3. For a full year a poor man named Carrol had lived with his family, and worked and struggled in poverty on a piece of land eight or nine miles northwest of Bozeman, which he had regularly filed upon under the pre-emption act. Adversity overwhelmed him, crops failed, sickness visited his family, carrying off a son, and he could "stem the tide" no longer. He came to me and inquired whether it would be possible to save something from the wreck. I told him he had fully complied with the law so far as residence and improvements were concerned, and that he could "prove up," pay for his land, and sell it to whoever he pleased. But how would he raise the money to pay the government price? He had to swear in making entry he was acquiring title for "his own exclusive use and benefit." It was impossible for him to continue on the claim; his resources were exhausted, a Rocky Mountain winter was whitening the hills, and he had a large family to support. My sympathies were touched at his story, which I knew to be true, and I told him to call again, having mentally resolved to help him out of his difficulties if I could. His claim was one of natural advantages, and I had a friend make me an offer for it, which would allow Carrol enough to get out of the country after paying the government price, but not near enough to remunerate him for the labor and improvement he had put upon the land. I then had my clerk make out a deed, ready for Carrol's signature, conveying the land to this friend, and sent for him to come in with his witnesses. All the necessary facts were proven by credible witnesses, the required personal affidavit was made, and I passed over to the receiver \$200, with his official fee; and then Carrol signed the deed, and it was sent to the county recorder. But my clerk, expecting the receiver would be at my office the day before he came—as it had been arranged for him to be—dated the deed one day too early, and so it went on record. A mercenary land agent two or three years after overhauled the records for flaws he might take advantage of in his own interest, and dis-

covered the conflict in dates. The facts showing "a case," the matter of confliction was brought to the attention of the commissioner, whereupon he ordered the entry canceled, and intimated it would be altogether the proper thing to do to arrest and prosecute Mr. Carrol (a man of unquestionable honesty) for perjury. Yet it has been the practice, since the first land office was opened, for claimants to mortgage or sell outright their land before the ink was dry on the receiver's certificate of final payment; at least one-third of all the lands entered are so disposed of.

3. Another case, involving great personal hardship, is reported from Northern Dakota, and, considering the general depression which had existed throughout the country previous to the present revival of trade and industrial activities, I have no doubt it is but one of many of the same kind. A claimant, having expended all his available means and performed a year's personal labor on a piece of land he had filed on under the pre-emption law, presented himself at the district office to offer his final proofs and make payment. His proof as to residence and value of improvements was altogether satisfactory; but when he was asked the formulated questions, "Do you own 320 acres of land in any other State or Territory?" and "Have you left land in any other State or Territory to settle on government land?" he was struck with dismay. He felt that the last-earned home of a long-life struggle had been wrenched from him, for he could not give negative answers. He was the legal owner of 320 acres in the State he came from; but he said he was willing to swear that, though the legal title vested in him, the land was hopelessly mortgaged; that he had little, if any, hope of ever redeeming it; and that this explained why he had left his old home and sought a new one on the prairies of the West. He was not allowed to make entry. The law and rulings were both against him, and it is presumable he would consider himself fortunate to get for his improvements half their cost.

5. There is a large class of enterprising and every way worthy citizens who have been in the vanguard of emigration since Chicago was a frontier village. Life with them has been one continuous battle scene. The nation and civilization have been benefited—the former strengthened and the latter extended—by their struggles and sacrifices; yet poverty has uniformly been their lot. The large majority of this class exhausted their pre-emption right among the first who availed themselves of the law of 1841; they afterward took the benefit of the homestead act of 1862; and again they are "blazing" paths in the wilderness, courageous as ever, but without that physical strength and endurance which belong to youth and the meridian of life. Around them are unoccupied thousands of acres, but it is perjury for them to drive another location-stake; to seek, under the law, a little patch of ground of their own to be buried in. It is easy to distinguish this meritorious class from those—none of whom are ever convicted—who make a business of obtaining lands in one district after another by perjury and subornation of perjury.

The above are all practical examples of general application, and to the claimant in each the public-land laws have proved "a delusion and a snare." To apply too closely the jurisprudential maxim that "ignorance shall not be plead to excuse violation (by omission as well as commission) of law," in administering the land laws, often defeats the beneficent object of their enactment. The general reason upon which the maxim is based, that of public policy, does not extend to the public-land laws, which affect but a few of the entire population, are intended to reward the bravery and enterprise of those who widen the boundaries of civilization and add to the nation's wealth by leading in the settlement of the public domain. In their behalf, if at any time or under any circumstances, technicalities should be disregarded when they contravene substantial justice. If the settler builds his cabin and turns his first furrow with the honest intention of becoming a freeholder by complying with the requirements of the land laws, and no prior right exists to the same location or any part of it, he should be held, by virtue of his improvements so made in good faith, to have acquired equities in the tract which could not be defeated by subsequent proof of his being disqualified to make entry under the technicalities of the law. The consideration to the government is *the act of settlement*, the increase of the taxable wealth of the country, by adding to it cultivated acreage and extending the means of production. But if title should be sought through fraud, let the offender be convicted and punished under the criminal laws.

"But it is impracticable," I will be told, "subversive of all law and order, to disregard, relax, or modify the express enactments of the legislature to relieve against the hardships of individual cases." To this I answer, first, that the Interior Department has, in my humble judgment, established rules and issued instructions, under the general delegated authority of Congress to that department to prescribe the methods of executing the land-laws, entirely too complex and exacting to be in harmony with their generous, humane spirit and the motives and objects of their adoption; and, secondly, Congress has before it the objectionable features, as shown by experience, and can, by amendatory legislation, give the country a more perfect system. For instance, taking in their order the individual cases above cited—

1. Should not the fact that I had expended much money and time on a tract of land

without having acquired title give me an additional claim to make new filings, instead of disqualifying me from ever again seeking to make entry under either the homestead or pre-emption law?

II. In the second case, would not substantial justice have been done by allowing the unfortunate settler who succeeded to the possessory right of another without (through ignorance of the legal principles governing the transfer of realty) taking a regularly executed deed, to have made a *provisional entry*, subject to the prior right of the first claimant of record—such provisional entry to be, under the principle of relation, considered as absolute when he came in with his final proofs?

III. In the third case, why should a variance of one day, caused by a clerical error, between the date of the day of transfer and the receiver's certificate—the government having received the price fixed upon the land, and the evidence being that the law had been complied with as to residence and value of improvements—have subjected the unfortunate pre-emptor to a threat of prosecution for perjury and the innocent purchaser to a forfeiture of the land he had honestly paid for.

IV. In the fourth case, would it not have been good policy and in harmony with the general spirit of the land laws to have allowed the claimant to make entry upon his filing in the district office a certified abstract of title of his former homestead, and making affidavit, supported by the oaths of two credible witnesses to his credibility that he was not worth enough, over and above other debts and liabilities, to pay off the mortgage?

V. In regard to the class referred to in my fifth citation, would it be in the slightest degree detrimental to the public interests, and would it not be in harmony with the motives and objects which were governing considerations in the adoption of the land laws, to make an amendment for their express benefit which would be somewhat of the nature of a bankrupt law for the benefit of the unfortunate in business? Give the old pioneers one more chance, upon their filing satisfactory evidence that they are landless, unable to purchase land, and have owned no land within five years next preceding the date of their application.

Gentlemen, there are many other defects and injustices, as I conceive them to be, in the practical workings of the public-land laws; but I cannot detail them within the time at my command and treat of other matters embraced in your list of questions which I desire to consider. But this particular fact I should like to impress upon your minds, that the experience has been that those who *willfully* violate and evade the provisions of the public-land laws *are never called to account for their wrong-doing*, while well-disposed and upright men are often subjected to great hardship and loss by the agents of the government sacrificing the *spirit* of the land laws to *their own arbitrary and inflexible rules*; and thus, too, have frauds been made possible, as the sharks of the land department know exactly what is required in the way of *forms* to acquire titles fraudulently, and they have as thoroughly systematized their operations as has the Commissioner of the General Land Office the government's. That class for whose express benefit the pre-emption and homestead and other land enactments were adopted—those who seek to acquire *homes* under them—are never guilty of intentional violations. Those who intentionally violate the law have no fear of its penal provisions; they are dangerous only to those who ask for a quarter section in good faith for the purpose of cultivation, and who do not make a business of studying *the tricks of practice*. The "professional swearers" about land-offices were never known to build a cabin or turn a furrow. Nearly the whole of Goodhue County, Minnesota, the most valuable farming county of that State, was fraudulently covered with Sioux half-breed scrip by bogus guardians of the mixed-blood children, for whose benefit the scrip was originally issued, the majority of the intended beneficiaries never having got a rood of land or a dollar for their scrip. The agricultural college scrip donated to the various States was a huge "job." Some of the States accepting it only realized from 25 to 60 cents on the acre represented; yet the bulk of it has been palmed off on the pre-emptors at its par value, the last robber in handling it being the attorney engaged to prepare the claimant's final papers. Invariably the moneyed shark in the background plans the fraudulent entry first and finds his bogus claimant afterwards, the latter in no sense of the word being a member of that noble army of pioneers who have conquered the wildernesses of the continent and carried the standards of American civilization from the lakes to the Pacific.

I view the "desert-land law," as it stands, to be in effect an offer of a premium for successful fraud in acquiring land titles, and a piece of class legislation in the interest of the capitalist against the *bona-fide* settler in good faith. Was it asked for by the practical farmers of Utah, Idaho, Montana, Arizona, or any other section where irrigation is indispensable? Pre-emptors and homesteaders in those countries never thought of such a measure, but bear testimony with one voice to the inexpensiveness and slight inconvenience of cultivation by irrigation, and the great advantages they have in opening farms in the valleys of the mountains, in natural conditions, over the old settlers in the organized States. Wherever water can be found to irrigate a section of fertile soil there always are, or will be, four pioneers ready to bring water onto it and

reduce it to cultivation, and thus become actual settlers in good faith. But I would favor government adopting measures looking to the reclamation by irrigation of extensive districts, where the outlay in money and extent of labor involved would be so great as to require large capital. If General Frémont's scheme to turn the waters of the Colorado River over the arid basin through which it flows should be realized, the result would undoubtedly be to give the nation a realm of Arcadian beauty and Italian fruitfulness.

The timber-culture act, considering the general character of the public domain still unappropriated, is the wisest measure of the kind ever adopted by Congress, and I submit that if it is amended at all, the change should tend to still further encourage forest culture on our timberless plains. It is beneficial in the highest degree to the citizen availing himself of its provisions; but the greatest resulting benefits will descend to posterity; and it operates to increase the national wealth from sources that would otherwise be measurably non-productive.

Radical reform is called for in the establishment of land-offices. The rule has been to locate them at the centers of political influence, thus making them subservient to the local influences of the places securing the location, instead of establishing them where the greatest number of agricultural settlers would be accommodated.

I have not the time to elaborate upon the practical working of the mineral-land laws, but would suggest that as they, like the agricultural-land laws, are primarily intended to encourage the development of the natural resources of the country—the first step in doing which is invariably taken by the poor man, the prospector—sound policy dictates that future legislation in regard thereto should mainly be directed to simplifying and making less expensive the methods under which rights by discovery are established. The capitalist is always able to take care of himself. The discoverer of the great Comstock mineral vein, which has made millionaires by the dozen, did not get as much as \$100 for his immensely valuable find, and in a fit of despair, without a penny in his pocket, he blew out his brains. Within seven miles of where I am now writing the discoverers of the only producing silver-mine in the Black Hills—three brothers named Merritt—are following a promising coal-vein without enough money ahead to buy a month's provisions. I believe they will open a valuable coal-mine; and what then? *They will be at the mercy of the capitalist.* Under the provisions of the coal law they must file on the land (now unsurveyed) within sixty days after the plat of survey is received at the district office, and within one year thereafter must prove value of improvements and pay for the land at the rate of \$10 an acre. The plat embracing the land will be on file in the district office within three months, and within fourteen months from that time they must, in order to secure a quarter section each, raise about \$5,000, besides providing for living expenses, purchasing tools, &c., from now until then; and they cannot realize by selling coal until a railroad shall have been constructed near their mines. No other discovery of a regular coal-vein has yet been made on the eastern side of the Black Hills. Men so situated cannot, under the existing law, make secure their rights by discovery; and without such men mineral discoveries would rarely be made. I would favor an amendment to the coal law allowing the discoverer of a coal-vein on the public domain, not less than fifty miles from any other known coal-beds, or each one of any association of discoverers, not to exceed four in number, forty acres of land embracing the discovery as a gratuity, and give him or them one year from date of discovery within which to file the required proofs. I also think it would be good policy to extend the benefits of such a law, modified to specifically apply to the different kinds of mineral found, to all discoverers of mineral in new regions. As the mineral laws now stand, the man with a little money in his pockets can do better to remain idle and watch for opportunities to take advantage of discoveries made by others than to explore himself.

I think the law fixing the surface extent of mineral veins ought to give unconditionally all within the side lines to the discoverer. Overlapping surface rights are the pregnant cause of nine-tenths of the litigation over mining property; and when these contests get into the courts the party having the most money is usually the monkey that weighs the cheese.

I do not believe it would be to the disadvantage of the mineral discoverer to cut down claims by right of discovery from 1,500 to 500 feet, "linear measurement along the line of the vein," for in nearly every instance he transfers his right on what is disclosed in his discovery shaft, and the capitalist is therefore the one most benefited by the extent of the claim; but if this change should be made I would favor square locations, holding all rights within the boundary lines inviolate on the surface. The miner should be allowed to follow his vein wherever it leads below, the prior location taking the ore where two veins intersect—which is the existing rule.

You ask "how the government can best ascertain and fix the character of the different classes of land." It is, in my opinion, impracticable for the government to attempt to do anything of the kind. The settlers or locators will seldom fail to claim the land for that for which it is most valuable, if known, and then the rules governing that specific kind of land—"agricultural, mineral, pastoral, timber, or otherwise"

—can be applied. There is not much danger of the government being defrauded by false representations as to character, for adverse claimants will nearly always put in an appearance when one tries to acquire title to valuable mineral ground as an agricultural claimant. Consider, gentlemen, that years ago Lieutenant Mullan graded a military wagon-road from Fort Benton to Fort Walla Walla across some of the richest placer districts that have been worked in modern times, his expedition embracing a full corps of scientists, and reported that he found no evidence of the existence of gold on the route, and you will concede the impracticability of governmental attempts to classify the different natural conditions of the public lands. That can only be done, so far as mineral lands are concerned, by individual enterprise, stimulated by the hope of finding a fortune.

As to pastoral and timber lands, the value of which as such can be estimated by viewing them, and should be designated by the field-notes of survey, title to them will not be generally sought by this generation under the pre-emption and homestead laws; and I would suggest that it is not necessary for Congress to legislate at all in regard to the former, and that the latter be disposed of, in small tracts, by lease under long terms—until cultivated timber could be grown large enough for domestic use—reserving to the miner the right to enter and explore and mine for minerals. This assumes that contiguous farmers would be allowed to enjoy the grass lands as tenants in common, subject to the local laws regulating and defining rights by mere occupancy, and that the lessees of the timber lands would only acquire the right to cut and appropriate the growing timber. The general government (or State by cession to it) retaining the title paramount (except such portions of the timber lands as might be transferred under qualified mineral patents), the time would come—the tillable area having been extended to the furthest limit by the necessities of increasing population—when both classes of lands, now comparatively valueless, would be a rich source of income to the public Treasury.

Before leaving this branch of the subject, I would suggest that the law in regard to quartz-mill sites needs changing. It grants to mine-owners five acres of “non-mineral land” for this purpose. Without a mill-site a quartz-mine is barren property; and it is almost impossible to find five acres of “non-mineral land,” in the strict sense of the term, conveniently near a quartz-mine; and, besides, the ease with which pretended mining claims can be set up on any tract of ground of that extent, near a developed mine, has attracted to the mining districts a class of bad men, locally known as “blackmailers,” unscrupulous vagabonds, who make a business of asserting adverse rights expressly to be bought off.

I am not well enough acquainted with the different systems of surveys to express a valuable opinion upon their respective merits; but would suggest, as settlers on the public lands are usually poor men, that it is high time to put a stop to the system of “making surveys on horseback,” which means for the subcontractors having charge of the work in the field to run out the exterior lines of the townships, hurriedly establish the section and quarter-section lines with cabalistic marks no one can understand (and which it is to their interest to make unintelligible to the settlers), and then draw their vouchers. The established rules of marking boundaries are seldom observed. This is an abuse needing correction.

In the Black Hills, “croppings” are often wider than the maximum legal width of veins.

In all mining countries mineral veins frequently so deviate from the direction of the supposed trend in locating them as to go outside the established side lines. Hence the justice and expediency of the rule, “follow the vein underground wherever it leads.”

As to the suggestion that mineral discoveries be recorded in the government land-offices, and that the officials thereof be invested with exclusive jurisdiction of all questions regarding adverse rights (of course with the right of appeal to the Commissioner and Secretary of the Interior), I would suggest that this might necessitate the establishment of a multiplicity of land-offices in the mining regions; and as a matter of convenience and security to themselves, though incurring additional expense, prospectors would undoubtedly prefer, if this change were made, to initiate their rights by district or county record, as now provided, and then file a certified copy of such first record in the land-office, for the reason that the former offices might be more immediately accessible. And when a location is made the discoverer is anxious to have his record made at the earliest moment. And if all this kind of business should be transferred to the Interior Department direct, I would suggest that a distinct class of land-offices be established, to be known as “mineral-land offices,” to be given exclusive original jurisdiction over mineral lands, and that they be officered by good lawyers, who have had practical experience in mining litigation. The responsibilities of their position would be grave. Their adjudications would at times involve property rights to the extent of hundreds of thousands of dollars, and it would be a mockery of justice and a disgrace to the government to give such appointments to those who had done the most effective service on the stump or at the ballot-box. So far as the Black Hills are concerned, if Dakota is not at once admitted into the Union or a law passed extending

her judicial facilities, something of this kind will have to be done, as our local courts are overwhelmed with the increasing business brought before them, the bulk of which is mining litigation. But as admission might not be the proper remedy for all the mining Territories, and probably the same state of facts would apply in a degree to all, we here have a cogent argument in favor of establishing "mineral-land offices" (or courts) on the general plan outlined.

If discoverers of mines of the precious metals, like those of coal deposits, should be compelled to acquire title by purchase within a given time, I would make that time not less than three years. The sound policy of favoring discoverers as against capitalists is obvious.

I never knew an application to be made for placer ground with the main object of thus acquiring title to a vein. I do not believe the general law, so far as it relates to placers, could be improved. It is seldom invoked, the local rules almost universally prevailing; and strong companies will never be allowed, under the operation of the local rules, to acquire vast bodies of alluvial gold deposits which are available to the poor miner.

In practice, as well as under the decisions of the courts, it is nearly impossible for claimants under other than mineral titles to prevent mining claimants from developing their ground.

It is questionable whether it will ever be necessary to resort to irrigation in the valleys of the Black Hills of Dakota. Excellent crops have been raised three years in succession without irrigation. But should it be found, by future experience, that irrigation will have to be resorted to in seasons of exceptional dryness, an abundance of water for the purpose can be had from the Rapid, Spearfish, and Redwater Rivers, which drain the most extensive farming districts of the Black Hills.

Moving on west and northwest from the Black Hills, until the valleys of Northern Wyoming and Montana are reached, we find increasing dryness in the atmosphere; but no part of the continent is better watered than those regions, almost every cañon having its flowing stream, and the valley lands are usually sloping, so irrigation adds but little to the labor and expense of cultivation. Millions of acres lying between the Black Hills and the headwaters of the Columbia, now supposed to be worthless except for grazing purposes, will in time be reclaimed and rank among our very best wheat lands. I write and form my conclusions from personal observation.

If mountain soil can be injured by irrigation, it has not yet been, to my knowledge. The oldest cultivated soil west of the Missouri River, in large bodies, is in Utah, where irrigation has always been resorted to, and there "worn-out soil" I never saw or heard of. And in Montana repeated irrigation seems to have the effect of making the soil quicker and deeper—new mineral fertilizing elements, I presume, being disclosed, and imparting their virtue with each successive following, from the water acting as their solvent.

There are scarcely any valueless valley lands anywhere in the mountain regions of the United States that it is possible to irrigate. In Eastern Oregon and Washington Territory, in California, Nevada, Utah, Arizona, Montana, Idaho—everywhere, on either side the great Rocky Mountain Range—nearly all below the sterile snow-lines are natural grazing lands, or can, if possible to irrigate, be reduced to cultivation. The sagebrush and prickly-pear wastes, so long thought to be utterly irreclaimable, have been made to "blossom as the rose." The "Great American Desert" of the past generation has been, by the progress of American enterprise, obliterated from the maps and buried beneath the richly-producing furrows of the pioneer farmer. The high elevations, generally, from the head of the Missouri to the mouth of the Colorado, are covered with noble forests or nutritious grasses, or are veined with fissures of gold and silver rocks, while coal and all the base metals are abundantly found. Believe me, gentlemen, the grand march of American progress will not be retarded by the mountain barriers between the older States and the young civilization of the Western seaboard, but accelerated rather. There seems to be, at every part of this vast empire so far as explored, incentives to human enterprise. Over all these vast regions new trade-centers will be built up and connected by railroads; and, as it is only through the toil and sacrifices of the producing classes such achievements are possible, it is earnestly hoped that the last grant of lands has been made to monopolists—that every acre will be reserved for homes for the brave souls who lead in the work of subduing the wilderness and enlarging the fields of honest industry.

Respectfully submitted.

H. N. MAGUIRE.

*Testimony of Charles T. McCoy, register of deeds and clerk of the court, Bon Homme, Bon Homme County, Dakota, on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. Charles T. McCoy, Bon Homme, Bon Homme County, Dakota, register of deeds and clerk of the courts.
2. For twelve years.
3. Yes; have acquired title to land under homestead law.
4. Have been clerk in the United States land-office at Springfield, Dak., and have observed closely the general workings of the laws.
5. From personal experience. The title to my homestead cost me, cash to the government, \$18; house, \$75; breaking 18 acres, at \$5 per acre, \$90; incidental expenses, \$25; total, \$188. Breaking at that time, 1868-'69, and all other material was about double in price of what it is at present.
6. Yes; in the first place, I think that when a party commences his contest in good faith, and deposits his fee and has all the expenses to pay, he should have a prior right to the land, and if the contest is decided in his favor, he should be allowed at least thirty days to appear at the local office and make his filing. Second, I think that when a person has lost his right through some technical point, and can make it appear beyond a reasonable doubt that he has not disposed of it either directly or indirectly for a valuable consideration or favor, that his right should be restored, as it seems to me that he has had no actual benefit unless he has perfected an entry, neither has the government been deprived of any of its public domain.
7. The soil is of a light, sandy loam, very durable, and I have known parcels that have been under cultivation for eighteen years without rest that are apparently as strong and fertile as at first. The remaining government lands of this county consist almost wholly of upland prairie and pasturage.
8. By general rule.
9. Have no practical knowledge of surveying.
10. Have no suggestions to make.

#### AGRICULTURE.

1. The climate is good - rain-fall rather light. The winters are mild, with the exception of an occasional snow-storm. Seeding generally commences in March, and corn-planting in the last of April and first of May. Snow-falls are generally light, and stay but a few days. Rain-fall is rather scarce in the month of July, when wheat is in the dough. No irrigation ever been tried in this locality.
2. The rainfall is generally in the months of April, May and June, September and October, plenty in the fore part of the year; not sufficient in July and August.
3. All of it.
4. Have no irrigation.
5. None.
6. No knowledge of the form of irrigation.
7. Rather poor, I should judge.
8. None.
9. None.
10. None.
11. None.
12. Very small, not to exceed one-tenth.
13. Think there is no need of distinction here.
14. Not at present.
15. About four acres. Good.
16. Twenty-five head.
17. Six and one-tenth.
18. Increased rapidly—in past twelve years.
19. No. No.
20. No.
21. Creeks in some localities, but generally woods.
22. Know nothing about sheep.
23. Have no knowledge.
24. They do in some localities here.
25. None that I have heard of.
26. Cattle, 3,044; sheep, 492; this is exact, taken from the official return of the assessor.
27. None.
28. Yes, considerable. The surveys are not marked distinctly, and great errors appear in the tracts as to quarters; for instance, I refer to the survey of Bon Homme Island, situated in township 93, range 58. Where there is a strip 77 rods wide, about two miles long in excess of what there should be, and the parties owning on both sides are now in vexed litigation as to who is the owner.

## TIMBER.

As to this clause, my views I will give you in general. I should judge that, compared with other localities, this county is very well timbered, and an immense amount is being planted out, most of which is cottonwood, and appears to be best adapted to soil and climate, and high winds that prevail. As to questions 7, 8, and 9, I would place the matter in the hands of the local land officers, with instructions to protect the timber, and at all hazard prevent this unlawful cutting and appropriating government timber.

As to mines, I have nothing to say, and respectfully submit my ideas for your consideration.

Yours,

CHARLES T. MCCOY.

*Testimony of F. W. Pettigrew, of Flandreau, Moody County, Dakota.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. F. W. Pettigrew, Flandreau, Moody County, Dakota; real estate dealer.
2. Seven and one-half years, eight and one-half in the Territory.
3. I have acquired title to public land under the pre-emption and homestead laws, and now cultivating 40 acres of timber under the timber-culture acts of Congress.
4. Ever since I have been in the Territory I have been constantly engaged in locating settlers and aiding others to acquire public lands.
5. In an uncontested case a party cannot acquire title to public lands for less than \$100, and generally it costs more in a contested case. It adds at least \$100 to the expense.
6. The department at Washington is too long a time in deciding cases of contest, much to the inconvenience of settlers. The system of making proof to sustain an entry is no better than the old way and ought to be abolished; it does not prevent fraud on the government, but costs the settler too much money to prove his title.
7. All the land in this county is agricultural and pastoral, no mineral or timber.
8. By geographical divisions.
9. The system of the survey of agricultural land is all right if it were properly carried out, but as contracts are now let the surveying is poorly done. The deputy surveyor should have the whole contract price for surveying and not be required to divide with the surveyor-general. The contract for township and subdivision section lines should be let to the same deputy and then his work should be thoroughly examined by a competent person. I have never known a case where the work of a deputy was properly examined and consequently the surveying throughout this country is wretchedly done.
10. The system is good if properly carried out.

## AGRICULTURE.

1. The climate is adapted to the raising of all kinds of small grain, early corn, &c. The rainfall is more uniform as the country settles. The seasons are usually long enough to mature crops of all kinds. Snowfall in winter is usually light.
2. April, May, June, September, and October; largest amount in June and September. Yes.
3. All.
4. Artificial irrigation not practical.
5. None.
6. None.
7. Not necessary.
8. Irrigation is beneficial to gardens; crops can be raised anywhere but do the best on level land.
- 9 to 15. Not applicable to this country.
15. One acre for summer and 3 tons hay for winter.
16. Ten.
17. Increased.
19. No.
20. Does not apply to this section.
21. Good wells.
22. Ten.
23. Not enough sheep raised to make a test.
24. Yes.
25. Does not apply here.

26. Cattle 3,000; sheep 160.  
 27. None.  
 28. Yes, most assuredly; and those that can be found do not correspond with the field notes.

## TIMBER.

1. None.  
 2. Cottonwood, maple, and ash grows thrifty. Cottonwood the best grower, from 2 to 7 feet per year.  
 3. Am not posted.  
 4. The remainder of these questions on timber I am unable to give any answers, as this is a prairie country and I am not conversant with the timber districts.  
 The questions on lode and placer claims I am not acquainted with, as this is not a mining district, being purely agricultural.

These answers to the questions herewith are respectfully submitted by

F. W. PETTIGREW,  
*Clerk of the District Court, County and United States Deputy Surveyor,  
 and Dealer in Real Estate.*

*Testimony of Thomas S. Sharp, farmer, Olivet, Hutchinson County, Dakota.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

*To the Public Land Commissioner, Washington, D. C.:*

Have lived in the Territory twenty months; a farmer, and have acquired a homestead under the homestead laws. Have closely watched the workings of these laws and the results to the settlers.

The time of obtaining a title is about eighteen months, in uncontested cases.

There are grave defects in the working of these land laws.

1. There has been much land passed to speculators and others through means of pre-emption and homesteading, under cover of actual settlement by those who took the land.

2. There is and has been much taking of land without actual residence thereon or in the community by the holders of the same.

3. The late amendment of the "timber culture" laws opened up the chances to non-residents, so that in three months after said amendments no timber-claims remained untaken for miles in advance of settlement. These claims are worked largely by agents.

The remedy, I think, would be to restrict the benefits of "timber claims" to homesteaders and pre-emptors.

Our country hereabouts is decidedly of the grain and corn class, though grazing is very successful. The land may be described as prairie, with very scanty and inferior timber on the James River, and is either bottom (alluvial) or table land, of generally level appearance and uniformity of soil.

Limit the amount of public land that one holder can possess to 160 acres and we should be better off. The real feeling of every one is to own all he can and make his pile out of it in the future.

The climate is fine and dry; rainfall inadequate, though usually sufficient to make good crops; the summer longer than in Illinois or Wisconsin, where I lived, and the actual and practical temperature higher than the weather records indicate, for our summers are more cloudless and night temperature higher than East.

The rainfall commences last of April and closes in September; June the rainiest month.

Our native timber would not equal the amount of 100 acres of good eastern forest; that is, all in our county.

The usual timber planted is cottonwood, the most rapid and hardy we have. Other kinds do very well. I am trying the locust, basswood, hickory. Our plantations are all under seven years of age.

The timber question will greatly affect our future welfare. The present laws are a wholesale damage to the region, and are not faithfully complied with; at least, in a majority of cases under my observation.

Absenteeism is another great evil, and in many neighborhoods renders the establishment of schools, &c., impossible, thus wronging the *bona fide* settler.

The land officers recognize the fact that much perjury is committed, which they say they are helpless to prevent. The officer at Yankton told me eighteen months ago that a family of Russians took a number of sections (I forget how many), and that some who swore they were twenty-one he should have supposed were sixteen years of age.

Respectfully,

T. S. SHARP

*Testimony of F. Simpson, notary public, Kingsbury County, Dakota.*

The questions to which the following answers are given will be found by unfolding page opposite page 1 :

1. F. Simpson, notary public, Kingsbury County, Dakota.
2. In county six months; in Territory eighteen months.
3. A pre-emption; shall make it a homestead.
4. Have been a locating agent all the time since I came to the Territory.
6. I think that 80 acres of timber claim should be given to actual settlers in same section beside the quarter section.
7. Land is rolling and smooth, mostly with a clay and lime subsoil, suitable for the best agricultural lands.
8. Can't say.
9. I think the present system the best ever can be or that has been, having an experience of fifteen years running lines.
10. None to make; only that I think one-half of each section should be timber claim, and for actual settlers.

**AGRICULTURE.**

1. Climate excellent; rainfall sufficient; usually five months without frost; but little snow; and no water for irrigation.
2. In the spring and first of summer, when most wanted.
3. All of it.
4. None of it.
5. None.
6. Can't say.
7. No supply.
8. Crops can be raised all over this county.
11. None.
12. All tillable.
14. No.
15. Two acres; the best I ever knew.
16. Can't say.
17. This county has only been settled this season.
18. Increased slightly.
19. No. Yes.
20. I think not.
21. Wells and some lakes and marshes.
22. I think ten is called equal.
24. Yes.
25. None here at present.
26. Corners are well marked.

*Testimony of Karl Winter, farmer and county treasurer, of Olivet, Hutchinson County, Dakota.*

The questions to which the following answers are given will be found by unfolding page opposite page 1 :

OLIVET, HUTCHINSON COUNTY, DAK.,  
December 31, 1879.

1. Karl Winter. Farmer; treasurer of county.
2. Five years.
3. Homestead, under the act of Congress approved May 20, 1862.
4. Have had much experience in locating colony of Germans from Black Sea country in this and adjoining counties.
5. In uncontested claims, after making final entry, from four months to eighteen months have elapsed before patent is delivered at the local land office. The reason given, usually, for this delay, is "that they are behind their work at the department." The time between filing and offering final proof is regulated by law, and, of course, is as the law-makers designed it to be. In contested claims the duration of the contest is varied, owing to the time necessarily required for parties to produce the evidence, as well as to press of business in local land office. The expense cannot be stated. In uncontested claims the law regulates the fees and price of land. As to the party's "working" expenses while acquiring the land, they are as varied as to amounts as the amount of capital invested. Hundreds go upon their homesteads with nothing, and come out at the end of five years with a good home. How they get along in the mat-

ter of expenses during those years is a question that cannot well be answered, but they do it. Many others go upon their lands with some property and ready money enough to start well; but they come out at the end of five years with less than those who started with nothing. Pluck and business tact seem to be sufficient for any emergency, while a lack of these elements will soon make a rich man poor. From my varied personal knowledge, and from knowledge acquired from extensive intercourse with others, I am impelled to the above conclusion as to the "expense of acquiring public lands."

6. The public land laws are undoubtedly systematic and good. Their practical operations are not always equable; for instance: John Doe filed upon a homestead in January, 1874. His wife being very ill, it became a necessity for him to take her to friends and remain with her there for two years. He returns and finds his homestead jumped, and under the rulings of the land office he is not allowed to file a homestead a second time, and loses his right in consequence. The remedy for this evil should be set out in the law and not left to the discretion of land officers. In this case John Doe is not a lawyer, but an ignorant man, and did not know what steps to take, if any were necessary, to retain his homestead claim. Richard Roe did not do precisely the same as John Doe, but lost his pre-emption by a similar force of circumstances.

7. The lands of Hutchinson and adjoining counties are strictly prairie. They are destitute of natural timber and are all agricultural and pastoral.

8. The character of these lands is very uniform, and cannot be excelled for agricultural and pastoral uses.

9. The system adopted by the government could not well be improved upon.

10. It would be difficult to devise a better plan than the one employed at present.

#### AGRICULTURE.

1. Climate dry and healthful. Winters cold and dry. Sufficient rainfall in spring and summer for agricultural purposes. Average about 25 inches. But little snow in winter, the winds drifting it generally into ravines and hollows. The spring and summer seasons are sufficiently long to mature vegetables and grain. Not many fruits will endure the climate. Irrigation not practicable on the uplands. The streams are generally too much below the surface; but irrigation is not often desirable, and is never resorted to.

2. The rainfall mostly occurs in spring-time, but there are frequent showers through the summer. Rain seldom falls in autumn in any quantity. None in winter.

3. All cultivated without irrigation.

4. Never employed.

5. None.

11. None.

12. None.

13. See former queries and answers.

14. Not an acre should be sold at private entry.

15. Two acres. The grass is excellent.

17. Principally agricultural.

18. Increased.

19. Territorial herd law regulates stock-ranging.

20 and 21. Water supply from springs, creeks, and rivers.

25 and 26. Cannot tell.

27. None.

28. Posts all burned down years ago.

#### TIMBER.

1. None. Originally there was a little growing along the Dakota River, but it has nearly disappeared.

2. Cottonwood, ash, walnut, maple, and willow. Cottonwood is unquestionably the best. Some of the cottonwood has grown six or seven years, and presents a very encouraging appearance.

3. The timber lands should not be disposed of at public sale and only in small tracts, not larger than 160 acres to the person. To lease them would be only to give the lessees the power to rob the lands of their timber under a license. Saw-mills now cutting timber on government lands under the present pretense of paying for the "stumpage" is nothing less than an outrageous system of despoiling and swindling. They rob the lands of the good timber, and leave it in a condition that is uninviting to actual settlers. Saw-mill owners should buy the trees of actual settlers. This would give the settlers a new business enterprise and help them to secure a livelihood while making their new homes.

4. See No. 3.

5. I am very familiar with the growth of timber and its destruction from the Missouri to the Pacific. In rare instances a second growth comes, but not generally anywhere, for all over the West herds of cattle and sheep prevent the second growth from coming. In general, when the timber gets thin enough so that grass and undergrowth starts, it becomes very inviting ground for stockmen to range their stock upon, and the growth is ruined.

6. Cease granting the lazy, impudent, careless, and evil-hearted Indians the liberty of roaming at will all over the forests and prairies of the West and building their camp-fires along their trails, and the forest fires will be at an end.

7. The whole system is a system of destruction and robbery. No one should be allowed to cut the timber that does not belong to him.

8. The idea is outrageous. There should be no local customs of despoiling the timber lands of the government.

9. Either the land officers or United States marshal should have explicit orders to prosecute every violation.

Not acquainted with mining.

KARL WINTER.

*Testimony of J. M. Howe, register land office, Lewiston, Idaho.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. J. M. Howe, Lewiston, Idaho, register of land office.

2. Eleven years.

3. One hundred and sixty acres under the pre-emption law.

4. Have been register nearly three years.

1. Richard J. Monroe, Lewiston, Idaho, receiver of United States land office.

2. Fifteen and a half years.

3. I have not.

4. Have been receiver nearly nine years.

5. Time, from date of proof; uncontested claim, from twelve to twenty months; contested claim, from three to — years.

6. Yes. The pre-emption law for failure to define the character of residence; failure to make forfeiture of rights positive, upon non-compliance with the law; the homestead law; for failure to provide for the benefit of residence prior to date of entry; for failure to make the heirs the beneficiaries in case of the marriage of the widow; for failure to provide for a preference right in the contestant against an abandoned entry; and for allowing more than six months in which to make proof after expiration of five years' residence.

7. High rolling prairies, interspersed with deep and abrupt cañons, and bordered on one or more sides with timbered mountains; the prairies are fertile agricultural lands; the mountains densely covered with pine timber; the gulches, cañons, and streams abound in gold; the declivities afford excellent grazing.

8. First.—Withdraw all mineral, coal, and timbered lands from the operation of the pre-emption and homestead laws.

Second.—Provide for the complete survey of all lands at once, or at an early period.

Third.—Have four classes, viz: Agricultural, mineral, such as gold and silver; coal and valuable stone, such as lime; and timbered, without regard to humidity of climate, irrigability, or other physical characteristics.

Fourth.—The exact character of lands to be established by well-adduced testimony, as a matter of fact. The general assumed character to be returned as now by the surveyor-general, so as to put the matter upon inquiry.

9. The survey should be continually extended over all classes of lands in regular order. Surveyors, under the immediate supervision of the department, should be kept in field; the contract system should be abolished, for the reason that the easiest places are selected by the contractors, regardless of the value of lands, and arid plains are surveyed to the exclusion of fertile hills and valleys.

The complete extension of surveys is demanded by the rapidity with which immigration is at this time being carried on throughout the United States; the agricultural lands are fast being absorbed, and the timbered lands are needed for the development of the country; proposed railroad, some in process of completion, will form a network throughout the whole country, making available the remotest lands.

10. Allow to each person, qualified as a pre-emptor, 160 acres of agricultural land, to be secured under either the pre-emption or homestead law, whichever he may elect, but not allow both rights. This I should maintain is the intendment of the laws as they now exist, but construed differently. The timber-culture law might well stand it is at best a costly process of acquisition.

## AGRICULTURE.

1. Speaking for this land district, I may say that the climate is variable regarding temperature, the valleys along streams are much warmer than the high prairies, and the rainfall and snowfall are less in the former than in the latter. Generally the length of seasons is: summers, comparatively, from March, seed-time to harvest, September and October; winters, frost and snow, December 1 to February 15. The rainfall has largely increased within the last four or five years, caused undoubtedly by the increased amount of cultivation. The water supply cannot be made available for irrigation, as it runs in deep valleys and cañons.

2. The rainfall occurs generally from October to March, occasionally commencing earlier and continuing later, thoroughly saturating the ground. Little or no rain falls after April until about October, when most needed, but all grain crops mature upon the moisture held in the soil.

3. All the agricultural lands can profitably be cultivated without irrigation.

4. Only small portions along streams.

5. All grain crops and most vegetables.

6. No experiments have been tried.

7. Rivers and small streams.

8. No accurate knowledge; know of one farm of 200 acres irrigated for the purpose of raising timothy hay, the process having been carried on for 10 years without perceptible injury; grain crops can be raised at altitudes of 3,000 and 4,000 feet.

9. The system of irrigation is not generally practiced, only isolated cases, therefore cannot give data; there are no restrictions placed on the use or waste of water.

10. No water taken up.

11. None.

12. One-twentieth part.

13. Pasturage lands should be classed among agricultural, and as such, subject to pre-emption and homestead under the general law, ultimately to be proclaimed for sale; should not deem it practicable to establish pastoral homesteads.

14. It would, doubtless, be advisable for the government to put these lands in the market, upon recommendation of the local officers, first holding public sale, at a minimum of \$1.25 per acre; and the quantity should be restricted to each purchaser, in not more than 80 acres.

15. There are no statistics. I should judge from five to seven acres per head. I assert this to be the finest grazing country in the United States.

16. The product of ten good cows.

17. From five to ten.

18. Diminished.

19. No; cattle should be provided with feed in winter; they are, however, kept on ranges, though attended with some loss in severe winters, say about one out of three: they could be controlled by fences.

20. They would.

21. Mostly springs, frequently rivers and small streams.

22. Not more than three would equal one beef.

23. Diminished; they are very destructive to grass, grazing so close.

24. Yes, if forced to, but cattle dislike to follow sheep; it is bad economy.

25. The different interests are decidedly antagonistic, and laws have been passed restricting sheep-grazing within prescribed distances of occupied lands by settlers, but are looked upon as unconstitutional and remain obsolete.

26. Sheep, 20,000, and 5,000 cattle; sheep in herds of 1,000 to 2,000, cattle at pleasure, are not herded.

27. No further suggestions.

28. Serious difficulty; corners have nearly all been obliterated. I judge they were imperfectly set originally, being for the most part indicated by stakes driven in mound, which have rotted away and otherwise been destroyed. I would suggest that they be relocated, so far as to place substantial monuments upon township corners and lines at least once in two miles.

## TIMBER.

1. The mountains bordering the prairie country and extending almost interminably northward are covered quite densely with fine timber, mostly pine, fir, cedar, and tamarack. We might say one-half the land in this section of Idaho is timbered.

2. Cottonwood, poplar, locust, box-elder, and some nut trees; the latter are regarded as the best for timber, but are harder to cultivate; the poplar family is the easiest and surest raised, reaching one foot in diameter in six or seven years; the hard woods and nut trees would require twenty years to become serviceable.

3. Should hold the timbered lands from sale; should fix a stumpage value upon the timber, a price for wood; appoint a special agent for each district to collect the rev

enue and to prosecute depredators. A very large revenue could be derived from this source, and it would work no greater hardship upon settlers to pay the rates in this manner, for the price of timber, whether bought from manufacturers who own the timber, buying the lands, or who buy it from government, paying stumpage, would be about the same; in fact, it comes out of the consumer anyway. By this method of selling the timber the lands would become cleared and are then valuable for agriculture or mining, and might be sold as such. Should laws be enacted for the sale of timbered lands, I should recommend that not more than 40 acres be allowed to each person and he to be an actual *bona-fide* resident within the land district comprising the land; 20 acres would be enough. The price of timbered lands should not be less than \$2.50 per acre.

4. I should not classify the kinds, price, nor size of tracts.

5. There is to some extent a second growth, of no considerable value however, being mostly brush-wood.

6. Forest fires are occasioned mostly by carelessness of lumbermen, travelers, and Indians; they rage nearly every year during the dry period; are more destructive than all the depredators combined; the mode of prevention is by stringent Federal laws, to be enforced by a prosecutor in the person of the special agent before mentioned, who could make personal investigation and inflict speedy punishment.

7. The depredations upon public timber are extensive, being for railroad ties and timber, mineral, building, agricultural, and other domestic purposes. There is much unnecessary waste, especially trees that are suitable for shingles and shakes, the butts being used while the tops are left to waste.

8. Property in public timber, according to local customs, is conceded to be in the party reducing the timber to his possession.

9. They would not be, for the reason that they *could* not be so efficiently executed by the United States district land officers as they would by a special agent, a sort of *plenipotentiary* whose sole business should be the execution of the timber laws; from personal experience I can say that local officers *cannot*, even with full powers, attend to the business properly, and subagents under them are not satisfactory.

#### LODE CLAIMS.

1. I have had no experience.

2. From observation I should say that the defects are but few, if any

3. Have no data.

4. Have no knowledge.

5. Have no knowledge.

6. I presume there has.

7. I have not.

8, 9, 10, 11, 12, 13, 14, 15, 16, 17, and 18 I cannot answer, as I have had no experience.

19. All district laws, customs, and records should be abolished and the initiation of record title be placed exclusively with United States land officers.

20. The adjustment of mining controversies should be left absolutely to the United States land officers in the same manner as contests under other land laws.

21. From observation I should consider it desirable to retain the leading features of the existing mining laws; I could not speak further.

22. Locators should be compelled on penalty of forfeiture to acquire title by purchase within a reasonable time, say one year.

#### PLACER CLAIMS.

1. One-twentieth, principally gold.

2. I am not.

3, 4, 5, 6, 7, 8 and 9 I cannot answer for want of practical knowledge.

Very respectfully submitted.

J. M. HOWE,  
*Register, Lewiston, Idaho.*

RICHARD J. MONROE,  
*Receiver.*

*Testimony of E. B. Bonnelle, chief clerk to the surveyor-general of Montana, Helena, Mont., relative to rectangular surveys, monuments, and inspection by surveyor-general.*

E. B. BONNELLE, chief clerk in the office of the surveyor-general of Montana, testified at Helena, September 27, 1879, as follows:

I think that the rectangular system, so far as it goes, is a very good one. I think

there is some room for improvement in its details. For instance, the monuments might be of a more permanent nature. I think there ought to be an inspection of these surveys, and I think there should be an inspection of mineral surveys as well as of agricultural surveys. The surveyor-general could do that if a sufficient amount were allowed to defray his expenses.

*Testimony of Edwin H. Combs, farmer and stock-raiser, Madison County, Montana.*

The questions to which the following answers are given will be found by unfolding page opposite page 1 :

1. Edwin H. Combs, Madison County, Montana; occupation, farming and raising stock.
2. Since June 17, 1863.
3. I have, under the homestead and pre-emption laws.
6. I think the present laws good enough when administered by just officers.
7. I have seen the greater part of the Territory, and think an average of two-thirds of the entire country is grazing, the balance timber, mineral, and agricultural.
8. The present laws are good, and any change would interfere with the already-acquired titles of those who have made this country what it is.
9. The land law, as it is, prevents to a great extent monopolies, and any change, I fear, would not make it any better.
10. In my opinion the present method works well for the interest of government and the poor man, and gives general satisfaction.

AGRICULTURE.

1. The climate is dry and healthy. Rainfall very light. The snow principally falls on the mountain tops, and consequently the streams are very high during the irrigating season.
2. The rainfall is mostly in June and July. Sometimes heavy snows fall in the valleys in May, but are warm, going off rapidly, without freezing nights.
3. Not any.
4. About one to ten.
5. Wheat, oats, barley, and nearly all the vegetables grown in the Middle States.
6. About 500 square inches.
7. From the creeks and rivers the supply is good. Montana is the best watered country in the world.
8. I think irrigation agrees with this alkaline soil. The altitude has not much to do with the season. Some of the large lower valleys are more subject to frost than those high up in the narrow valleys at an altitude of from 4,000 to 5,000 feet.
9. All the water is exhausted. The law forbids any waste. It is a mistaken idea to irrigate and return the water to the stream from whence it came. A field of 200 acres will absorb 1,000 inches for three months, or during the growth of the crop.
10. The waters of small streams is mostly claimed and used, but the one-thousandth part of large streams is not used. Each farmer is allowed the full capacity of his ditch, commencing with the first settler, until the stream is exhausted.
12. About two-thirds.
13. It is not.
14. It is not.
15. Other sections are better adapted to grazing.
18. It is fully as good as it was sixteen years ago.
19. Some of them fence in large tracts for winter pasture.
20. I think not.
21. From springs, brooks, and rivers, promiscuously and plentifully.
23. It has increased—become thicker.
24. They will.
25. Hostile feelings prevail wherever there are sheep.
28. There is none but a surveyor can understand the hieroglyphics on the barred stone, and the surveyor who established these corners resides in the Territorial prison.

TIMBER.

1. Timber is plenty, but very poor quality.
2. Cottonwood.
3. I oppose any disposition or restrictions whatever of timber lands. With but few exceptions the farmers go from 10 to 15 miles for timber, and climb the rocky sides of

the perpendicular mountains, consuming an entire day, for an inferior load. The main body of timber lies far up in the mountains, and government ought to pension the men who get it down.

5. With a few exceptions there is none. Groves of young Norway pine cut for fencing have grown again.

6. Fires occur from careless men camping out, hunting and prospecting. The law or punishment is both fine and imprisonment.

9. I think not. It would be impracticable.

#### PLACER CLAIMS.

5. They are defective. The present law allows it to be taken and pre-empted in large tracts, thereby securing a title from government. Consequently it is monopolized and held by capitalists to the detriment of the entire country.

*Testimony of Uriah Bruner, attorney at Law, West Point, Nebr.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

5. On uncontested entries. Homesteads, including witnesses and their expenses, about \$40, average. Some few made their entries, say for \$25, while others, living at a great distance from office, their expenses have run up to \$75. Timber claim, including proof, exclusive of the improvements that have to be made on the land, would be about the same as in homesteads. Fees in pre-emption entries is considerably less. Since I am out of the office I understand that the applicant to homestead and timber claims is required to give thirty days' notice by publication of his intention to make final proof. This is a useless and burdensome expense, which should be done away with. No one but the proprietor of the newspaper will be benefited by such notice. Contested claims are frequently very expensive to the contesting parties. The average expense of a contest is perhaps \$40. Where no attorneys are employed and personal notice is given, the expense is sometimes reduced to about \$15, but more frequently it will cost \$100.

6. The timber law as it stands has several defects, in my opinion. It requires that 2,700 trees should be planted to each acre, and 675 shall be growing and be thrifty at the time of proving up (five and six years after same are set out). There should no more trees be required to be planted than there are required to be living and in thrifty condition at end of the eight years. No trees that are fit for forest planting will do well to be planted so close together. They will choke out one another, and while the steepest, thriftiest, and most vigorous will survive, it will yet be injured by those that have been killed out by the choking process. Trees in forest grow straight, with long bodies, but they are much retarded in their growth by being overcrowded. It is far better to plant the proper distance, so they won't interfere with the growth of each other by overcrowding, until they attain a sufficient size for purposes of poles and fire-wood, when the thinning-out process can be done by the farmer with profit to the forest as well as to himself. I have considerable experience in raising forest trees in planted groves, and my views I give here are from actual observation and practical experience. I believe that the claimant under the timber law should be required to plant 40 acres for every 160, and the number of trees required to be planted to the acre should be about 640, and the number at time of proving up to be about 500. That all homesteads and pre-emptors on prairie lands should be required to plant and have in growing and thrifty condition 10 acres for every 160, five years after the entry of the same, and before the passing of said entries for patenting—in homesteads the proof to be made at the time of final proof, and in pre-emptions and commutations the proof to be made five years after the date of settlements.

There are vast areas of lands in Western Nebraska and Kansas that are worthless for all purposes except for grazing. These, under proper restrictions, could be sold on condition that part of the same be planted in forest trees. Here care should be taken that the same be not sold in too large bodies to one person or company of persons. Rather have the government inaugurate a system of leasing (as they used to have in Australia) at public auction for a term not to exceed five years at a time. Great care will have to be used or large cattle-raisers will soon have a monopoly of all desirable grazing lands. In this land district (Norfolk) the lands are what is called prairie, with very little timber here and there on the edges of the water-courses and running streams. Most of the lands are good, rich, farming (agricultural) lands. There are yet large bodies of bad, sandy lands, nearly worthless at present except for grazing purposes.

13. I think that homestead, timber law, and pre-emption law should be left in force even in exclusively pastoral lands, until it is definitely determined that no homes will be made or farms opened any more. Cattle monopolists will undoubtedly clamor for an abrogation of the land laws on the plains. But we should proceed very cautiously in this direction. We should remember that this is the day for aggression by large monopolists of all kinds. Our government was established not with a view for enriching a few at the expense of the masses, but rather for the purpose of affording opportunities to the toiling millions to rise with the dignity of labor to a comfortable competence for himself and his family. It is the government's duty to see to it that all shall be brought up well, be educated in the rudiments of a good common-school education, and that this bringing up may be done by the *paterfamilias* without materially cramping himself. The question of social science is undoubtedly the most important that can engage the attention of statesmen, and the land question entering so largely into this question, is, perhaps, the most difficult to solve. "To move with great caution" must be our motto.

2. Time of growth, from May to September.

Very respectfully,

URIAH BRUNER

*Testimony of R. H. Criswell, notary public, Indianola, Nebr.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

INDIANOLA, NEBR., January 24, 1890.

*Public Land Commission, Department of the Interior:*

GENTLEMEN:—I laid away this paper in my drawer and forgot it, which is rather a bad apology, but it is true. I answer interrogatories seriatim.

1. Robert H. Criswell, Indianola, Red Willow County, Nebraska; lawyer.
2. Nearly seven years; I have perfected a homestead and am holding a pre-emption
4. I have been doing land law business during the entire period of my residence here.

5. I had three years' credit as a soldier, and my homestead cost me \$700, but I paid for my house and hired all my work; took about 40 acres and put in three crops. I have known men have nothing, not even enough to file on land, but get on it and in four or five years have quite a good property, such as a team, cows, hogs, poultry, and grain for bread. Contested claims, generally, in this region have not been defended, and the cost is \$15 and \$20 to clear them.

7. I am honestly of the opinion that this will be one of the best agricultural districts of the world, as well as one of the best fruit districts. I have seen the finest vegetables raised here, such as parsnips, cabbages, and beets, I ever saw. The finest wild plums grow here I ever saw, and plenty of wild grapes. Professor Aughey, of the University at Lincoln, said to me he would risk his reputation that this valley would be as famous as the valley of the Rhine for grapes alone. This will be a great fall-wheat country, and it only needs the wheat-grower to come with his plow and try it. I have not time to answer all your questions, but I do wish to insist that this is bound to be, par excellence, an agricultural country, and not a pasturage country; that is, a wild pasturage country, excepting, perhaps, in some few counties where the land is exceedingly rolling.

10. I beg leave to suggest that you cause to be amended section 2294 of the homestead law by striking out clerk of the County, and inserting any officer having a seal, such as county judge, notary public. As the law now stands county clerks oppress the homesteader by charging high fees, and the clerk here will not permit a man to make his own papers and be sworn and take 25 cents for the affidavit. He makes him pay \$2 whether he makes out the papers or not. Can you not have this remedied?

I close by insisting that you hold these lands for the actual settler and homesteader.

Very respectfully,

R. H. CRISWELL

*Testimony of Joel Hull, attorney at law and real-estate agent, Minden, Kearney County, Nebraska.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

Referring to your list of questions and answers numbered in accordance, I have the honor to submit the following:

1. Joel Hull, Minden, Kearney County, Nebraska; attorney at law and real-estate agent.

2. Have resided in the State and county since March, 1872, nearly eight years.

3. I have acquired a title to a quarter section under the soldiers' and sailors' homestead act, and made an entry under the timber-culture act.

4. I have for four years last past been a practicing attorney before the local land offices in this State, and been engaged in securing entries for settlers, prosecuting contests for the abandoned lands, and attending to the making final proofs of claimants.

5. In uncontested claims my experience is—

For entry fees (double minimum lands).....	\$18 00
Attorney fees for making entry papers.....	2 00
Final receipts on proof.....	9 00
Notice of intention to make final proof.....	1 00
Publishing the same.....	3 00
Taking proof of claimant and witnesses by attorney or county clerk.....	3 00
Examining papers by register.....	1 00

Total expense..... 37 00

For contested claims, additional, from \$15 to \$30, under either the homestead or timber-culture laws.

6. In the relinquishment of timber-culture entries, the purchaser of the rights and improvements now sends to the land office his application for the tract, accompanied with the entry fees, his affidavit, and the relinquishment of the former occupant, which secured for him a prior right to the land. I would suggest the same rules and laws to be made applicable to homestead entries. By the present rules a purchaser of the improvements has no rights to the land, and often other parties succeed in getting places with valuable improvements that ought to have been secured by the purchasers of such improvements. "The first legal applicant" now gets such land, while the purchaser ought to have a prior right.

I would further suggest that the law be changed so that the affidavits to be taken, in making a homestead entry, can be made before the register, or receiver, or clerk of the county court, or other officer authorized to administer oaths, having a seal. The present rules designate none but the register, or receiver, or a clerk of the county court. A notary public or county judge are generally more competent and convenient to attend to the business than the county clerks.

I would further suggest that the same rules be made applicable to the making final proofs on homestead and on timber-culture claims where distance from the land office would be the reason specified, to wit, before the county judge or a notary public, for the same reason as above.

I would thus make the rules uniform in regard to pre-emptions, homestead, soldiers' homestead, additional homestead, and timber-culture entries, giving full power and authority to county judges and notaries public as well as to the county clerks to take applications, administer oaths, both in the affidavits required in making the entry and in making final proof in each of the above classes.

7. The county of Kearney, Nebraska, is a gently undulating plain prairie, whose soil is a black loamy soil from one to four feet deep, generally two to three feet deep, and from my personal observation the greater portion of the eastern half of the State is similarly situated, and suitable almost exclusively for agricultural purposes. The southwest quarter of the State is to a great extent also suited to agricultural purposes, a small portion only on the extreme western end of the State being more suited for pastoral purposes. The northwest quarter of the State is to a greater extent more suited to pastoral uses. There is yet no mineral developments in this State that is worthy of notice. The timber is exclusively confined to narrow belts along the streams.

8. It will be difficult to fix the character of these two classes of land by any geographical line or division, for even in the extreme western portion of the State, along the streams the land would be properly classed agricultural lands, while adjacent to them would be found considerable tracts of land not at all suited for agriculture, but only for pastoral uses. A general rule upon actual survey is the only way the character of the lands can be fixed without doing violence to the several classes. This may be and perhaps ought to be done by specially appointed commissioners for each State or Territory.

The claimants of land for pastoral uses often come in conflict with those wishing the same lands for agricultural purposes, thereby causing great and serious difficulties, disputes, and sometimes loss of life, and which can only be remedied by the classification by such rules and authority as will leave no grounds for such contests.

9. I am not a practical surveyor, but I think the present plan of parceling land is the best, most convenient, and economical for the agriculturist that can be adopted for that class of land suited for agriculture.

For the lands suited only for pastoral purposes I would suggest the parceling larger tracts of not exceeding four square miles to each owner and herder of cattle, not exceeding two acres to each beef animal occupying his tract claimed, and under suitable rules and restrictions.

The monopoly of large tracts by few men should be guarded against, and as the climate and amount of rainfall, as well as the character of wild grasses, seem to be undergoing a change continuously, more suited for agriculture here in the central portion of Nebraska, and west, it seems to me to be very unwise to finally dispose of these larger tracts until after several years has elapsed and the above-mentioned commissioners have reported several times the actual condition of several classes, and the probability of the lands in whole or in part becoming agricultural lands.

10. I cannot recommend any better system of parceling the lands or disposing of them to the actual settlers than the present existing land system. The agriculturist is, so far as I can learn, universally pleased with the present system. The convenience of making application for the tracts, the making the rules uniform for the several kinds of entries, and the convenience also of making proof, guarding only against fraudulent practices I have already referred to. The cattle men are not so anxious to own in fee simple the ranges they can occupy as to be guarded in their occupancy *pro tempore*.

My suggestion would then be after the certain tracts had been once classified as pastoral lands, to enter under a leasing system for a term of years to men whose sole condition will be continued occupancy with cattle, upon the payment of a small entry fee, at the local land offices. Let that term be five years with priority rights to another five-year term. After the above special land commissioners have resurveyed, re-examined, and reclassified the lands, and reported the same to the General Land Department. It may require several of these terms to finally settle the character of most of the lands lying in the States of Kansas and Nebraska, and west of the one hundredth meridian.

#### AGRICULTURE.

1. Climate in the south half of the State suitable for all the staple cereals, including winter and spring varieties of wheat; nearly all the desirable varieties of corn. Potatoes and all root crops do well. Rainfall is all we can depend on, irrigation being impracticable on the great bulk of the lands. The rain has heretofore usually been sufficient for securing fair crops of all kinds, and averaging about thirty-two inches during the year.

2. The season of the greatest rainfall occurs during the months of April, May, June, and July usually, some years a little earlier, others a little later, and invariably has, for the last eight years, come at the season when most needed for agriculture.

3. All of this section of the State may be cultivated without any irrigation. The soil of the State being of such a formation that the moisture from rains on cultivated lands is readily absorbed and retained to such a degree that droughts of from three to four weeks seldom affect the crops deleteriously.

4. Very little. Not one-hundredth part can be irrigated from the superficial formation, as well as the almost total want of supply of water.

5. Therefore no crops are raised by irrigation.

6. The lands in the central and western part of the State lie at an altitude of 2,000 to 3,000 feet above sea-level, and the higher table-lands, or rolling prairie, seem as well adapted to crops as those of lower levels or along the streams. The experience so far seems to indicate that the high prairies are more productive than the bottom lands along streams.

12. None of the central part of this State can be said to be adapted to pastoral use only. All may be cultivated fully as economically as to pasture the lands. As I before remarked, only a small proportion in the western end of the State can be so classed, and not exceeding one-twentieth of the whole State.

13. It will be extremely difficult to establish homesteads on pasturage lands; and on such lands as are found to be adapted to agriculture, it is my opinion no permits should be granted to more land than the homestead settler has. But on such lands as are suitable for pasturage and not adapted to agriculture I think it would be proper to adopt a system of leasing for short terms—say five years—to actual settlers, no greater amount than four sections to one settler, who shall have at least one beef animal to each two acres of his tract.

14. I would not advise to put these lands in the market for private entry at present, but rather hold them as before suggested, in trust for such uses. It is my observation that each year is developing a little larger growth of grass, and the very character of the grasses is gradually undergoing a change, some of the smaller grasses giving way to larger, coarser grasses, and each year is demonstrating the fact that a much larger area of the State is adapted to agriculture than has heretofore been supposed. The present system is a complete check upon monopolists getting control of large tracts of land, which is as it should be. Such lands, however, as are eventually demonstrated

to be adapted only to pastoral purposes may be then properly put on the market for private entry under suitable limits.

15. It is here taken to be fair to rate one beef animal, including the young, to every acre, but it being an agricultural section, and none making the wild lands exclusively their pasturage, taking up their cattle during the winter months and feeding them. It would not be fair to compare it with lands exclusively adapted to pasturage only. My impression would be that twice that amount would be necessary to each head raised and fitted for market on pasturage only.

16. About 200 head of cattle would support an average family.

17. But pastoral pursuit being engaged in by no one here exclusively, it would be difficult to compare the settled with the unsettled portions. Not more than four head to the section average in this county.

18. The growth of the grass for the past eight years in this county on the wild or uncultivated land has very sensibly increased. The cause, however, I attribute to the check put upon prairie fires, and that no great herds of cattle nor buffalo have ranged on them. The character of the grasses in my observation has also undergone a change. In the spring of 1872 in Kearney County and adjacent counties but little else than "buffalo" grasses were found on the high prairies, which are now covered almost entirely with the "bunch," "blue joint," and other larger and coarser grasses.

19. There being no ranges here, I cannot say but this—that when the homestead settlers come, the ranges are abandoned; fences, therefore, have neither been tried nor proven a failure. Fenced ranges may prove a success if they are not so expensive as to be impracticable. The method that would probably be adopted would be to have a suitable "corral" or yard to herd them in at nights or inclement weather, and watch them while out feeding.

20. The supply of stock water comes principally from wells. Those adjoining the small streams prefer to water their stock at the streams, but only for the convenience. The well water is considered fully as good as the stream water.

26. There are about 2,000 head of cattle and 200 head of sheep in Kearney County, but rapidly increasing with the growth of the county; these are in herds of an average of about six head in each bunch.

27. The present system is a good one and satisfactory so far. The surveys are in some few sections not quite clearly enough marked. The rules of entry and proof for the convenience and economy of the settler I have already alluded to. The corners are mostly found in a fair state of preservation. At some places, especially where sandy, it is difficult to find them, and in a few cases have to be re-established by county surveyors. A little charcoal or a charred post would have saved great trouble in a few instances if they had been used at the survey.

#### TIMBER.

1. There is no native timber on the upland of the State. None but the bottom lands skirting along the streams have timber.

2. The cottonwood, box elder, walnut, ash, the maples, and Lombardy poplar are the varieties mostly planted, and all are thriving and doing well. The hard woods, the oaks, hickory, and beech, it is thought, will succeed after the ground is shaded so that they will not be directly effected by the drying winds. Many of the more intelligent of our farmers are giving considerable time and attention to the growth of timber. There are no native forests in the State, but from the ready growth of forest trees, observant men think it can be made to produce trees readily.

Very respectfully, your obedient servant,

JOEL HULL.

*Testimony of Evan T. Jay, attorney and stock-grower, Frontier County, Nebraska.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

STOWE P. O., FRONTIER COUNTY, NEBRASKA,  
November 30, 1879.

*To the Public Land Commission, Department of the Interior, Washington, D. C.:*

1. Evan T. Jay, Stowe P. O., Frontier County, Nebraska, attorney and stock-grower.
2. Nine years in this State—seven years in Buffalo County, and two years in this county.
3. I lived seven years upon the southeast quarter of section 4, township 8, range 16 west, Buffalo County, Nebraska. I received a patent from the government under a soldier's homestead filing.

4. Since my removal to this county I have had a limited amount of land practice before notary public in land contest cases where, by stipulated agreement of both parties, the depositions were taken before a notary public.

5. From my personal experience I must say that my expense incurred in improvements and cultivation of my homestead were far greater than my profits, owing to the fact I lost most of my crops each year. By grasshoppers, drought, or hot winds from the south, I lost \$3,900 trying to farm; then sold my homestead for \$1,200, which was considerably less than my improvements cost. Had I devoted my time and attention to stock-raising instead of tilling the land, I might have made on the same capital, and during same time I devoted to improving my farm, eight or ten thousand dollars. While trying to farm I kept a small herd of cattle which brought me a handsome income. My experience has been: the cheapest mode of acquiring title to land will be to plow just as little of the ground as possible, reserving the remainder for pasture and hay.

Contested land suits are often very expensive luxuries, owing to the amount of spite and revenge under which the contest was commenced. I assisted one of my neighbors in taking testimony before a notary public last month, which continued six days, having 76 pages of legal cap written full of evidence, all about a 40-acre lot which, if sold under good title, would not bring more than \$1.25 per acre. The plaintiff in the case paid over \$50 expenses, and has no positive assurance of getting what all agree to be justice to him—that is, the right to this disputed 40 acres. The cheapest contest—publication and other fees are about \$25.

6. In the case above stated the plaintiff, a poor man, who had lived in this county five years, had undergone the adversities of grasshoppers and drought, but was enabled to starve along, living off of the increase of a small herd of cattle, selling the steers and making butter from the cows. About eighteen months ago he purchased the land-office receipt given to one W. F. Owens, who abandoned his claim and moved to Iowa, leaving his homestead papers with a neighbor to sell, if possible, for the amount already paid at the land office. Mr. Nolan purchased the papers and proceeded according to law, and had the first filing canceled after receiving notice from our district land office at Bloomington. The above-mentioned plaintiff proceeded to the county clerk's office and made his homestead filing upon this disputed 40 acres, and three-fortieths of his first selected claim—making the exchange of 40 in order to better the condition of his home. His papers were sent to the land office by mail. In a few days Mr. Nolan was notified that his neighbor had placed a soldier's filing on the whole of this contested 160 acres in the name of a party living in Iowa. This neighbor of Mr. Nolan's has an old grudge at Mr. Nolan, and in order to assist his revenge had succeeded in having this filing placed upon this land before Mr. Nolan's papers were received through the mail. All this resulted in the above contest, which cost Mr. Nolan \$50 in cash, the law being such that the plaintiff, on an appeal suit, had to pay for the taking of all the testimony. I consider that if the laws were so amended as to allow the persons who, in good faith, contest some prior filing to a tract of land and succeed in securing the cancellation of the same, that a sufficient time should be allowed that particular individual, say thirty or sixty days, to perfect his individual filing upon said land. The present rule being, the first application made after the cancellation is returned receives filing. Said rule results in most cases in innocent parties having to be greatly wronged, and compels them to expend their hard-earned money or lose their homes, which, in many cases, constitute their all.

7. The quality of our soil is a rich yellowish loam. The quality is excellent, and would produce all kinds of vegetation if rainfall could be furnished at proper intervals. The altitude of this country is very high. Except on the creeks and their tributaries, a distance of from 100 to 180 feet is necessary to dig in order to get water. Upon the margin of our streams a small amount of timber is found—white ash, cottonwood, and box elder.

8, 9. I have not had access to the act of Congress referred to. Would be much pleased to have it. I do most undoubtedly believe, from nine years' experience in Western Nebraska, that if our national Congress would enact a law by which all the territory in Nebraska west of the 100th principal meridian should be exclusively devoted to stock range, that a far better revenue would be derived than by trying to introduce agriculture into any portion of this territory. The citizens of this county, some five years ago, after having tried to prove this a farming district and failed, voted by a unanimous vote to abolish the herd law; and since that time this county has gradually settled up with a class of small stock-raisers, who are able to own from 50 to 500 head of cattle. Owing to the surrounding counties having herd laws, large stock-owners have not crowded our small ranges. The result is that this county has good live common schools. Our county does not owe a dollar of indebtedness, and we have a handsome little fund in the hand of our treasurer, (The said office I now have the honor of filling), while, on the other hand, the counties surrounding us are in debt; their county warrants only command 60 to 75 cents on the dollar. We have a few citizens in this county who still try to farm on a small scale. Their living is made by hauling

road 30 miles to the railroad, and selling it for \$4 per cord. Last season the hot winds from the south and the drought together rendered their crops a failure. Many of them will have to be supported by our county poor fund this winter or suffer.

This, I presume, is all out of place, and not at all what your honorable commission wish to hear, yet I am willing to make affidavit, and can furnish you sworn testimony, even from many who have tried to farm, that this above statement is correct. Yet under the existing land-office laws many poor men are led to come into this far western district for the purpose of trying to make a home and a living by cultivating the soil. Most cases have resulted in these parties returning again to the East, preferring to live on rented farms and give half of their crops rather than lose all here.

Our railroad companies have advertised their lands through these counties as being very productive, and many have been induced by reading these exaggerated accounts in eastern papers to move west, and in most cases have been disappointed, and have allowed their land purchased from railroad companies to revert back again, with all improvements and expense, to the companies, in order to again move east to a more productive climate.

I am convinced that if your honorable commission were privileged to visit Western Nebraska in person, that you would all join in pronouncing my theory as to the disposition of the greater portion of that lying west of the 100th principal meridian only adapted to stock raising.

10. By dividing this section of territory into small tracts, say from one to ten sections, and surround it with a provision that would protect the stock-grower, and the greater portion of the land could be sold by the government for fair figures. As to the homestead, pre-emption, and timber-culture acts, they are satisfactory, and in agricultural portions of the State are recognized as good, owing to the fact that speculators in real estate are barred out. Under the new act, allowing citizens additional 80 acres, I think the act should allow the location of that 80 acres wherever found, and not require the annexation to the first 80; much inconvenience is caused to those entitled to the additional 80 acres.

#### AGRICULTURE.

1. Climate is pleasant and healthy. Rainfall, if at proper seasons, has been for the last two years in sufficient amount to have produced all kinds of vegetation. The hot winds and the drought usually set in at the time wheat and corn most need the rain. Early spring commences very favorably, but the season three times out of five results in drought and hot winds.

3. Owing to the high altitude of this county irrigation is utterly impossible. Our county lays between the Platte and Republican Rivers.

12. At least one-fourth of this county is only susceptible of agriculture, or of cultivation by plowing. The remaining three-fourths is hills, cañons, and rough, broken highland.

13. I think the past has proven that the homesteader should fence from ten to thirty acres for a "truck patch," or for raising millet hay for his ponies that have to work in winter, and leave the remainder lay out for free range pasturage.

14. Answered in answer 10, as I view the situation.

STOWE, FRONTIER COUNTY, NEBR., December 29, 1879.

To the Land Commission, Washington, D. C.:

I was unexpectedly called from home, and am of the opinion that the above will be too late.

I have written to the Department of the Interior repeatedly, in order to get the land-office laws and blanks necessary to be used in assisting settlers, and also for the purpose of posting myself on the laws relating to public lands.

My dear sirs, I will remain under lasting obligations if you will send me a full outfit of laws and blanks, or cause the same to be sent to me.

If you desire anything further, relative to your interrogatories, I will be pleased to assist. Hoping to hear from you, I submit the within.

I am, very respectfully,

EVAN T. JAY,  
County Treasurer, Frontier County, Nebraska.

Testimony of D. L. Bliss, H. M. Yerrington, S. H. Day, and Judge Beatty, at Carson City, Nev.

D. L. BLISS made the following statement:

I am a member of the Tahoe Lumber and Fluming Company, which is perhaps more extensively engaged in the lumber business than any other concern or person in the

State. Most of our lands are around Lake Tahoe, in the counties of Douglas and Ormsby, and a small portion in Washoe County, Nevada, and some in California. We have title to most all of it. We have adopted the practice of buying the land, cutting off the timber, and then abandoning it, in order not to have to pay taxes on the land. The land in Nevada was located by the State. We got parties to take it from the State—320 acres each. We didn't lay in scrip in this State. All the land we got in this State was selected by the State, and we had no difficulty in getting our title. We don't use any timber on the public lands.

Nearly everything around the lake is bought up or taken up. Until recently on the other side of the lake we have only taken such timbers as would make logs, but lately we have cleaned off not only what was fit for logs but what would make wood. At first the cutting off of the timber increased the chances of fire, because we left the dry limbs on the ground, but after we commenced to utilize the limbs for cord-wood it decreased the chances of fire.

I am unable to say how long it takes for a second growth to grow up. If all the timber was off the hills it would take a very long time before new trees would grow up. It is of very slow growth. Fifteen or twenty years won't make much of a tree. Some trees we cut are 200 or 300 years old. I think we cut one that was 1,000 years old. It was 11 feet in diameter. In Montana it is said the majority of the trees cut are 150 years old, and that they are rotten at the heart, but that is not the case with ours. The majority of our trees are from 150 to 350 years old.

We have yellow pine, sugar pine, and what they call bell pine or black pine, which is least valuable to timber. Then we have red and white cedar and red fir. The latter is generally rotten for eight or ten feet at the root, called churn bottom.

From all my experience in the timber business, I think the government ought to sell its timber lands. I would grade the price. I would have some men that understood the business to value the land by section or quarter-section, and I would sell it in unlimited quantities.

We couldn't sell lumber within \$10 per thousand as cheap as we do now if we were limited in quantity. We have got to have a large quantity in order to pay any profit on the improvements. I think private ownership best conducive to the protection of the timber. The agricultural lands that I know of are not contiguous to the timber lands. We buy as much timber from parties who have taken up 160 acres as we do timber land. I would as soon buy the timber in that way as any other.

Land is nominally sold for \$1.25 per acre, and we can't get hold of land unless it costs us from \$3 to \$3.50 per acre; and we would just as soon pay the difference to the government as to somebody else. Instead of that the government gets \$1.25 per acre and somebody else gets the balance. There is too much red-tape about it. If you want to use the land in the next two years, you don't know whether you are going to get it in that time. They do not plant any timber in this State. I do not know how much of the area of the whole State is timber. I can make no suggestions about the timber lands other than I have made. There ought to be less red-tape about getting titles, and I don't think it makes much difference how the land is sold. I would just as soon buy timber of a man who owns 160 acres, as far as the price is concerned, as to buy it from the government. Of late years we have got pretty particular in that we don't buy any timber unless we know the parties own the land. We did used to buy without regard to that question.

Mr. HARRIS. I will add another suggestion or two: I think all scrips ought to be abolished; I think that the mineral lands should be sold without reservation, and that the miner ought to have the timber that grows on the mineral lands. I think there ought to be a uniform method of publishing the decisions that are made by the department in land cases, as long as they insist upon the land officers performing judicial functions.

H. M. YERRINGTON made the following statement:

I am the superintendent of the Virginia and Truckee Railroad Company, and engaged in the timber business. I think the timber-lands ought to be sold, if the government is desirous of getting its money and preserving the timber. They should be sold in unlimited quantities. By the introduction of the flumes which we use in these mountains, it takes a large aggregation of lands and all this sort of thing to make the business profitable, and the result of it is that these little fellows (small owners of timber-lands) they can't make it win, because a flume costs half a million dollars and that's the reason why if they are going to sell wood at a profit, they must sell it in large quantities. Our wood is scattered over an area of 50 by 70 miles; we have about 75 miles of flume, that cost about one and a half million of dollars. The timber has been cut off so closely at all convenient and accessible points that it won't pay a poor man to haul it.

When I first came here, in 1863, wood was growing within three or four miles of Carson; it was hauled by teams to Virginia City, and was worth about \$70 per cord at that time the consumption amounted to only a few hundred cords annually. When

we started in, the demand was increased to 900,000 cords a year, and teams couldn't do anything, because they could not make it pay, on account of the expense of hauling. With the increased demand the price of wood fell. Here are thousands of acres worthless unless you can get at this timber by means of these flumes. If it were not for the flumes, instead of using wood they would go to Wyoming for coal. That is the reason why I say if I were the government, I would sell the timber-lands in lots to suit customers.

Mr. BLISS. When the wood was carried by teams (which was about one-half the distance it is now carried by railroad) we used to get \$35 or \$40 a thousand for lumber in Virginia City; we are now selling it for \$17. I am speaking now of square mining timber. At present we are now bringing wood from California on a narrow-gauge railroad in the mountains, then through the flume, thence by railroad to Virginia City, for \$9 per cord. In Lake Valley, California, when we first went in there, they were then talking monopoly, and called it the Bank of California concern. They said we were going to grab up the whole country. Now I believe they are glad we got in there, for I believe there is not anybody else doing business there. About all the money they get, they get from our concern. The parties who own land there are not able to get lumber to market themselves. They depend on us to buy their logs and timber. They can't get it to market and sell it at the figures we do and make money without investing a large amount of means.

I do not think it is practicable to give to a person 160 acres of timber land for a homestead, with the proviso that he should cut timber thereon and live upon the proceeds. One hundred and sixty acres of such land would not support a man as a continuous thing.

Mr. WRIGHT here suggested that people had been in the habit of filing pre-emption claims on timber land, cut the timber off, and then abandon the filing.

---

*Testimony of S. H. Day and others, Carson City, Nev., relative to the survey of timber lands, cutting of timber, irrigation, pastoral homesteads, rainfall, sale of timber lands, arid lands, agriculture without irrigation, lien lands and mining school.*

Mr. YERKINGTON. We have got all the timber lands that we want, and it don't make any difference to us what laws you pass on the subject.

S. H. DAY made the following statement:

I have been deputy surveyor-general of the State for nine and a half years. I have read your circular on the subject of lands, and have made up my mind to answer it. In my judgment, in regard to the timber lands, one drawback has been that they have not been surveyed promptly. At Eureka, for instance, the timber was all cut off before the survey was made. About the only timber fit for lumber is found in the Sierra Nevada Mountains. In other portions of the State it consists principally of fir, juniper, ashogany, and nut-pine. In regard to irrigation, I think under the present system all of the water in the State that can be used for that purpose is now utilized for irrigation.

Governor KINKHEAD. I think that by using the proper appliances and having money enough to do it, the waters of Truckee River could be made use of to reclaim a large amount of land. I have heard of a scheme for diverting water out of that river to irrigate about 200,000 acres of land, but it would cost, I am told, \$250,000 to do it. Upon this timber question, last fall I was in the southeastern part of this State. I was pleased at the immense tracts of juniper and nut-pine which I saw there. They grow on, two or three feet thick, all the way from Eureka down to Pioche, but the valleys are dry. I think the idea of a pastoral homestead a good one.

I have been in Nevada ever since it was Nevada. I think the rainfall is about the same now as in early times, except that we have had a series of dry seasons for the last three years. There is not anything in respect that can properly be called timber except in the Sierra Nevada Mountains. I would sell those timber lands, perhaps, in unlimited quantities. The accessible part of this timber in Nevada has been already cut off, and it requires combined capital to get it out. In other places it has not been done to that extent. It is getting worse every year. I think these lands ought to bring \$2.50 per acre. I think it would be injudicious to pass any law with regard to arid lands which would drive the great herds of cattle out of the State which are now being pastured here. I don't think as a general proposition there is any particular conflict between the grazing and agricultural districts. I do not think the State is overstocked. Some portions of the State were overstocked last year on account of the dryness of the season, but it is not overstocked for ordinary seasons. In some places, as in Truckee Valley, they raise very good crops without irrigation.

We have some Indian reservations in the State, but there are no complaints about them. I am in favor of Congress granting to the State a smaller quantity of land than she is entitled to under the sixteenth and thirty-sixth sections, the lien lands to be selected by the State.

The State University at Elko does not amount to a great deal as yet, but we could establish a mining school with the proceeds of these lien lands, and it would be the best in the world, if properly provided for. It ought to be established at Carson or Reno, or anywhere contiguous to the Comstock. Such a school would have the finest advantages in the world, and I think the general government ought to foster an institution of that kind. It should have professors of high character, and official reports be made by them of the condition of the mines and tests of machinery. I think that would do more good to the State of Nevada than anything else, and to the country at large. This is the proper place for such a school. Here the scholars could have access to the mines every week, and receive practical education.

Mr. FASSETT. The only matter that I care to say anything about is that memorial that was forwarded to Congress during the last legislature concerning lien lands in place of the sixteenth and thirty-sixth sections.

Judge BEATTY. Upon the subject of square locations of mining claims, I might say this: It is a system that has never prevailed in this country, and I don't know anything about it. The old method of location under the local rules of miners was by posting a notice at the point where the ledge was discovered or near the ledge, and that, by the rules of miners, held a claim whichever way the ledge might run for the distance of the claim. Usually, by most of the local rules I am acquainted with, they had ten days in which to record the notice, and that held the claim as long as the requisite amount of work was done. The notice was recorded in the local recorder's office. That was the whole system. It was the means of taking possession without taking possession. This was changed by the law of Congress of 1872, and we now work under that act, still recognizing as being of some validity the rules and regulations of the miners in regard to certain things, such as posting the notice and recording the claims, the width of the claims. The act allows the local rules to restrict the maximum width within 600 feet.

In regard to square locations—that is to say, locations confined to the surface line in the form of parallelograms, a system under which the miner would not be allowed to follow the ledge beyond his surface lines, I will state that I believe it would be a very unpopular system among the miners. But there are advantages in that system. I have always doubted whether we did wisely in abandoning the Spanish system of location, but the miners are firmly set in the present system. The present mining law of Congress was framed by the Representatives in Congress from this coast, and it was passed with reference to their ideal ledge, and it has now to be applied to a great many formations that it never was passed with any reference to. I think there is decidedly less litigation under the system inaugurated under the act of 1872 than resulted under the old system.

*Testimony of Edward R. Chase, farmer, Wells, Nev., relative to public lands, agricultural lands of Nevada, laws, homestead application, local land officers, contested location, railroad lands, pre-emption, homestead patent, and claimants.*

WELLS, NEV.

GENTLEMEN OF THE COMMISSION: Having been a resident of Nevada since it was a Territory, a practical farmer, engaged exclusively as such for the last twelve years in Eastern Nevada, and somewhat familiar with our land system, I venture a few suggestions looking to the simplification and economy of the means of getting what remains of our public lands into the hands of *bona fide* settlers, &c.

1. We were grievously wronged in this, that our lands within railroad limits was raised to double minimum. The rule that the lands nearest the road were enhanced in value by the road is reversed with us; the agricultural lands of Nevada become more valuable as you recede. This is a patent fact, and is owing to the following causes: The market for our produce is found in the mining towns. They are off the road. We have little or no occasion to ship grain by rail, and on all occasions when grain brings a fair price the railroad company enters into competition with us. At this time they are delivering hay in Elko for \$80 per car, of 20,000 pounds, while I have lying before me their letter, asking me \$320 more for a car-load of tools for farmers delivered to me from the East than they charge to Sacramento. Freight on goods from the West here is about 2½ cents per pound; on hay eight-tenths of one cent.

2. There is no present reason for "sticking us" with double fees and commissions. A township of land in Nevada is not on an average of the intrinsic value of one section in the Northwestern States.

3. The law ought to be so altered that any person living 50 miles from a land office can do his business before any officer authorized to administer oaths living nearer:

him. If the reason heretofore given, to wit, to prevent fraud, is the excuse for continuing it, I think it no sufficient reason. It is surely more difficult to perpetrate a fraud of that kind in the immediate neighborhood where the facts are known than at the land office where they are not known. Why a homestead application must be made at the office when the final proof is permitted to be made at a distance is difficult to understand.

4. I have a suggestion to make, which will not only overcome all the objections as I believe which can be brought to the above, but will prevent many frauds. Make it the duty of the register to furnish an abstract of each week's doings for the local weekly; those interested in lands would keep posted; keep a broad light of that kind turned on the proceedings of the land office and there would be less villainy.

One of the chiefest hardships we are subject to is the extortion of the officers of the local land offices. While it is made a crime and cause of removal from office to ask or receive more than the scheduled fees and commissions, the land officers are permitted to practice as attorneys in any case coming before them, and to charge all they please for such services. In one case, I know that an agent sent in an application for a soldier's homestead; the register objected to the form used, made out new paper, and charged and received \$30. I believe the fee, &c., is \$13. In no case should the officers be permitted to charge for attorney's fees for practicing before their own tribunal. Allow \$1 for filing out pre-emption or homestead papers, and limit other business to a certain sum per folio.

There are several errors in the rules of practice.

1. It is simple nonsense to pretend that when a hearing has been ordered and a location contested by a person, that after the vacation of the contested location, every or any person has an equal show to locate the lands. The officers of the Land Office always disclose the fact to their friends, and it is just in my opinion to give the preference to the party who has been to the expense of showing that the location was improperly held.

2. It is no less against legal precedents than it is against the equities of trade to compel a person defending his location and sustaining his claim to pay half the costs. A friend of mine has just paid \$50 in gold to the receiver to defend a desert land claim of 80 acres, where there was no appearance of fraud, wrong, or injustice. He sustained his claim at a cost of twice the value of the land.

3. The law should make some provision for prosecuting an inquiry into an alleged fraud. Here is an instance: One Francis Honeyman attempted to obtain a homestead patent on lands he had never lived upon or improved. He procured final proof, stating that he had lived upon the land the requisite time; had fenced and cultivated 140 acres; had put on \$300 worth of irrigating ditches. The case was passed and ordered to patent. I learned the facts in the case and informed the department. They insisted on my taking witnesses at my own expense before the land office to show the fraud, and informed me that they had no way of getting the facts in such a case unless witnesses would come forward on their own motion and at their own expense and establish them.

The farmers living within railroad limits think the lands withdrawn from market for railroad purposes ought to be restored. We believe by a strict and fair legal construction of the railroad act of July 1, 1862, these lands tendered the company were tendered as a gift. Section 6 recites as the condition of the grants that the company should keep up the road and telegraph lines, so as to pay their cash obligations to us, in part, by transmitting messages and carrying mails and munitions of war. Their obligation to carry, transmit, &c., for us begat the necessity of keeping up repairs, &c.; in other words, there was no consideration money from the grantee to the grantor for the lands. It was, then, in law a gift. The law of gifts is that it is essential that it go into effect immediately. If it is to take place in the future it is only a promise, and, being without consideration, the law will not enforce it.

It is evident the government considered it a gift, and to take place immediately, because the bill fixes the time when they shall take the lands. By section 4 it declares that when a certain number of miles is completed and properly certified, that "then" patents shall issue to them for the 12,800 acres per mile for each completed mile. The word "then" can by no possible legal or grammatical construction relate to anything but the time when they should take what lands they wished or intended to under the grant. Government would have no constitutional right to give an indefinite period of time for them to accept these lands, and it is not to be presumed that they ever intended to exercise it. They hold these lands in trust; they are restrained in the disposition of them to the exercise of that trust within the limits of the common good and "general welfare." By the act of July 2, 1864, section 21, it was made a prerequisite that the company should pay for selecting, surveying, and conveying; but by no possible construction could it extend the time. The only reason that the Territories through which the road was to pass gave their support to the measure was that the lands were to be conveyed then—immediately—and would go to relieve them from the burdens of sustaining their municipal machinery by their taxation. That

act (the railroad act) was a tripartite contract. We the people were, by language clear and comprehensive, to have the privilege of buying all the lands not sold at the end of three years, at \$1.25 per acre; that is, all of us that were eligible to pre-empt. We have the right to demand of you that these lands be in the future subject to that obligation. Whenever we offer to tax these lands they tell us they have never accepted them. When we offer to pre-empt, the land office takes our declaratory statement, incloses it in an envelope with a prepared affidavit, and addresses it to the perjury department of the Central Pacific Railroad, and it comes back and is received as evidence that the lands have not only been accepted, but sold or conveyed. We hope this commission will change this in some manner so that we shall be relieved from the shameful spectacle of seeing the general government asking of the Central Pacific Railroad Company what disposition to make of the public lands.

The plea of the railroad company is that these lands have all been mortgaged to one of their number, and that the mortgage is a conveyance; and while they claim that we cannot tax the lands, the mortgage goes unrecorded and untaxed, and we carry double loads of taxation in consequence of it. While the improvement of our lands adds in an equal ratio to the value of theirs, their lands remain unsettled, depriving us of communities sufficiently dense to have schools or social organizations of any kind.

The Secretary of the Interior, awhile ago, made a feeble effort in our behalf by declaring, I believe, that all lands held by the company were subject to pre-emption. Will you for me give him the legal information that the bill reads: "All lands not sold or otherwise disposed of at the end of three years after the completion of the road shall be subject to settlement and pre-emption like other lands, at \$1.25 per acre;" and that it makes no difference how many times it has been sold since, it is always subject to settlement and pre-emption until it has been so taken, let whoever pretends to own it. No number of conveyances from the railroad company could convey to the holder any greater right than the railroad had; and if these patents do not so read, it is a reprehensible negligence on the part of the Commissioner of the General Land Office. It was at best a limited grant. It would look much more manly in the Land Office to accept of a filing on railroad lands, and leave the company or the grantee of the company to enforce his rights in the courts, than the present course.

While we have a thousand wrongs to complain of, they mostly relate to the maladministration rather than defective laws. I am constrained to believe that General Williamson is totally unfit for the place he occupies. He appears to have no sympathy in common with the people; every ruling has been adverse to them. He throws every obstacle in the way of their getting their lands. I believe it is the most sacred trust now left with the government. The pride and strength of every nation is in its farmers, those who till the soil they own. It is the only clear pathway out of this labor problem. I am somewhat familiar with the people's wants and necessities. I have lived twelve years on this homestead claim. I have tried for the whole time to obtain a homestead patent. At every step I have been thwarted by him and those acting under him. I have had my claim held up twice for two years and over on some trivial question. If I, without laches, without any charge or suspicion of unfairness, have to push away ten years, and at a cost of more than the government price of the land am still kept at bay, what show is there for those less acquainted with the forms of business? Many, many have thrown up in disgust, and made recent purchases under the desert act. It should be the care of the Commissioner to help these lands into the hands of honest homestead claimants, and to guard them in every other quarter. He was appointed and is held in his place by railroad influences, and we have no mercy at his hands. If your commission can wrench anything away from his grip for the people, God speed you.

Regretting that my time (owing to farm labors) has been so limited that I have not time to rewrite and to give more point, if possible, to some positions I have taken, I will ask possibly the privilege of supplementing this, if I think of more that is important to be said. I would like to take one of your commission through this country and get the history of each claim. I think the Indian ring is humane and beneficent beside that of the Land Office.

In haste,

EDWARD R. CHASE.

*Testimony of E. C. Hardy, stock-raiser, Elko County, Nevada.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

STATE OF NEVADA, County of Elko

To the Department of Interior, Public Land Commission:

HONORABLE SIR: I hereby acknowledge the honor conferred upon me by the receipt of your circular of questions affecting the interest of the people of the Western States and Territories in way of disposing of the public lands.

## PREFACE.

I am strictly an uneducated man. You will, therefore, overlook all parts of my report that would be bettered or finished by the advantages even of a common-school education.

I will only state facts plainly as they have appeared to me in the course of my practical experience. Any further details I may make than answering direct questions will be for the purpose of explaining my ideas, or for the purpose of giving you a knowledge of the experience I have had in the subject-matter, as will appear, for example, in reply to first question in your circular. My report will be short and positively within my own experience on the Pacific coast since 1852, twenty-seven years.

Name, Ebenezer C. Hardy; born in Haverhill, Mass., June 8, 1835. Parents emigrated to Wisconsin in 1842. I came to the Pacific coast (Oregon) in 1852, where I acquired land under the old "donation law," with which I became familiar. In 1864 I sold goods and mined in gold placer in Grant County, Oregon, where I became acquainted with the regulations of locating placer mines.

In 1868 I moved with my family to Boise City, Idaho Territory. I was with S. M. Wessels, first locator of lead ores bearing precious metals. These locations were made in Owyhee County, where I first became acquainted with that kind of ore bodies or contact veins. I have carefully observed the mountain timber interest of the various commonwealths. I was one of the first locators of Ward mining district, in White Pine County, Nevada. I moved with my family to Nevada in the fall of 1872, and have resided here since. My occupation at this time is growing sheep, cattle, and horses.

3. I acquired title to 160 acres of land, and my wife, Mrs. M. H. Hardy, to 160 acres of land, under and by virtue of an act of Congress approved the 27th of September, 1850, commonly known as the "old donation law." Said land was situated in Skamania County, Washington Territory, certificate No. 112, issued by Andrew Johnson.

4. Answered in No. 1.

5. I settled on the donation claim August 11, 1855, and obtained patent December 22, 1865, being ten years. This was an uncontested case, no conflict of title or of lines in any way. I think my expenses were about \$25, besides a private survey I had made to guide me in making my fences, as under that act of 1850 as amended our lines had to be run north and south and east and west. I think my neighbors received patents about same time. We had to live four years on the land in compliance with law. Thus, you see, we were six more years obtaining patent. Contested cases, such as Salem town site, Salem, Oregon, and Upper Cascade Landing, at the head of Cascade Falls, Bush vs. Bradford, in Washington Territory, much longer.

I consider the "donation law" and the "homestead act" the best for the actual settler and the best for the commonwealths of any laws that are now or ever have been in force: For the settler, because when poor he acquires a home at a time when he has no money to pay for one; to the interest of the country, because the offer causes some to engage in agriculture that would not otherwise do so, and agriculture is the foundation of civilization. It attracts industrious actual residents, who all have the one object of making homes, and no necessity or opportunity existed under these laws to mortgage them for purchase money. A settler under these circumstances would improve his place without fear of losing; could thereby contribute more largely and confidentially to the support of common schools, roads, bridges, and public buildings, churches, literary, scientific, and charitable institutions. I would say here that probably but few Eastern men can realize the responsibilities that are, by force of circumstances, thrown on frontiersmen in general. I consider they have double to do besides paying for their land; generally have Indians, and Indian agents, and military officers all against them, because the settler is really the intruder; for in but few cases is the land treated for, and the treaties complied with.

6. I have not seen defects in the land laws, except that conflict of railroad companies with the interest of settlers, in consequence of tardiness of surveys. It is my duty to call your attention to this subject, with the hope that it may lead to the saving of thousands of homes being made desolate. Here we have an example: The Central Pacific Railroad has been finished ten years, and the land along the route is not yet all surveyed. I have made \$4,000 worth of improvements on unsurveyed lands. These improvements have been made from time to time as my business required it. I have no means of acquiring title to this land. Should I lay desert claim on it, part would fall on the Central Pacific Railroad land, and they do not offer their lands generally along the Humboldt for sale. Under this condition of affairs what would be the chances of my heirs in the event I were to drop off—die? Thousands of others along Humboldt are alike situated. Besides, I see here in Nevada no general public interest taken. Every man seems unsettled, public buildings neglected, taxes enormously high, and a general unsettled feeling among the inhabitants along the line of the forty-mile reserve. I firmly believe in granting lands for the construction of roads. They advance civilization, and are every way beneficial. This country is worthless

without the Central Pacific or some other road. But I must pronounce it impolitic and unstatesmanlike to make such grants without providing a method and means of survey at some time, so as to have the survey made in sections of country not longer than one year behind the completion of the road. If necessary, give more land and make the railroad companies survey it or defray the expenses thereof, and receive their land; then it would be taxable; and, to avoid the taxes, they would sell to actual settlers. This would be well for the country. Otherwise let their lands be forfeited.

7. The public lands of this State are not (I should estimate) more than one-fiftieth agricultural. In a few of the very highest mountains and on the north hill-sides very small bodies of timber are found that will answer to saw into common lumber and mining timber. These bodies of timber are already (probably) more than half consumed for mining purposes and to build mining towns. On many of the low mountains are scattering "nut pines," or "pinion pine," and a "juniper cedar." Neither of these two last-named timbers are fit for building or lumber, but are very useful for charcoal for smelting ores. And the "juniper cedar" answers a good purpose for fence posts for wire-fences, being generally about the proper size for one post. Probably one-third of these two kinds of timber are already used up, and possibly one-half, as in the vicinity of large mining camps and near the larger railroad towns nearly all is gone for a large radius surrounding.

As to the pastoral interests of this State it is secondary, the mining interest being first and the agricultural interest third.

8. I do not think it practicable to make a geographical division of lands in this State, Nevada, or Idaho, or Arizona, but will suggest a plan in answer to question 12.

9. As to land parceling, I think the present method good.

10. I would classify lands in States or Territories where irrigation is necessary to produce an agricultural crop.

First. Land that has water running through it or so near that the natural water could be practically brought on to it to water the whole tract with, as first-class lands. Such lands I would dispose of under the old methods, and under the "desert land law," not higher than \$1.25 per acre even within railroad limits, as all the good lands of the agricultural States have been sold at these prices; and it must be borne in mind that irrigation is a great expense, first for ditches, and secondly an annual expense of conducting the water properly over the crop-land. Besides, these lands are generally poor and require more manure, as the water washes it away, and the ground is porous and much of the richness filters through below.

Secondly. I would devote one section or more of lands as pastoral to each actual settler of such land, if cultivated, as would be compelled to hoist water with wind or other power to irrigate. I would make the term of residence to acquire a patent four years. I would further allow the settler to buy the same at 25 cents per acre after living on the same two years. Then I would allow any citizen of the United States to buy one section of such land at 25 cents per acre, provided he should first improve the said section of land to the value of \$500, and then require the local land office to require ample proof to said improvements being equal to that amount before issuing certificate for patent. This last proposed law is more needed in this State than any commonwealth west of the Rocky Mountains, as the land is poorer, yields less grass per acre than any other, and will require considerable inducements to get settlers to buy and improve such lands.

#### AGRICULTURE.

1. The climate dry; rainfall light; season short; snowfall in deserts light, from 6 to 12 inches, the bunch-grass land often covered very deep.

2. The rainfall is principally in spring and fall; sometimes light rains in May and June. I cannot give you the number of inches, but surely less than any commonwealth west of the Rocky Mountains except Arizona. The general supply of water comes in the early crop season, and often in places does not last long enough to fully mature all crops.

3. No portion of the State can be successfully cultivated without irrigation.

4. Probably 1 acre to each 100 acres may be cultivated by irrigation of valley lands. More could be cultivated if water could be obtained. Upon second consideration I do not think there is running water to irrigate more than 1 acre to 500 acres, to average the State over.

5. Wheat, oats, barley, potatoes, turnips, beets, &c., and in the southern part of the State, in low altitudes, corn and vines and grapes, but generally in southern part of the State there is no water for irrigating lands.

6. A large quantity of water is required to irrigate land in this State, as the land is generally porous and the water sinks rapidly into the earth. There is no stratum of clay underlying the soil to keep the moisture up as there is in Illinois and Wisconsin. Added to this, the dryness of the atmosphere causes great waste by evaporation.

7. The source of supply of water is from small mountain streams and springs that soon sink in the desert valleys. Even the larger streams—Humboldt, Carson,

**Rees, and Truckee Rivers**—sink in this State. Fair crops are raised in the State to an altitude of 4,000 feet. A fine orchard is being grown at Humboldt House, Central Pacific Railroad; elevation, 4,262 feet. This rule applies to plain levels. In gulches, where the little valleys are more protected from frost, crops are grown at much higher altitude. Elko is 5,030 feet, and crops are grown higher on tributaries of Humboldt, but are confined to wheat, oats, barley, &c.

9. I am unable to state what portion of water is lost in ditches. I have before stated the waste is great from dryness and openness of soil and atmosphere dry. The laws generally of the Western States provide that parties living on the heads of streams and having first use of water shall turn the same into its natural channel, and various decisions have been made giving damages to second parties where water is wrongfully wasted by first parties to the injury of second parties. These laws are very important, affecting some of our heaviest mining interests, as well as agriculture.

Water has been taken up generally where it is anticipated that a mining town will be established; that is to say, where good-looking mining prospects are found, and also where the water is needed by parties for irrigation. Nevada State law provides that the locator of water may have the plat of his ditch or flume recorded in recorder's office of the county in which the proposed ditch or flume is to be constructed, then shall commence work on same within thirty days, and continue to work on same until completed. This act was approved March 3, 1866, and will be found in volume 4, page 415, Nevada statutes.

11. I have heard of several conflicts of water right, but only think of one now: Martin White Mining Company, and Mr. Wellington, in White Pine County. The company finally bought the land from Wellington and the water-right for \$12,000. This Martin White Company's place of business is at Ward district, White Pine County.

12. I have heretofore estimated 1 acre in 100 to 1 acre in 500 to agriculture; the rest pasturage only.

13. It is, in my opinion, practicable to establish pasturage homestead, as I have before suggested under the head of disposing of the public lands of the Western States. Question 14 explained under same head.

15. It is impossible to make any reasonable estimate on the lands of this State, as some lands will support ten times as much stock as other lands in same county. I do not think this State will raise on a general average more than one-fifth as many cattle as Idaho Territory to the same number of square miles, and about one-tenth as many as Oregon or Washington to the same number of square miles. That is, leaving out of this estimate the great Cascade Range timber belt and sound country, i. e., I mean to include only the grazing portion of Washington Territory which lies east of the Cascade Range of mountains.

16. About 200 head of cattle will be required at present rates of cattle in this country to support an average family. One hundred head, or less, if all stock round as usually grown—if the grown cows thereof were used for dairying connected with stock—would be amply sufficient. It is proper here to state that this State is poor for dairy business in the high altitudes, where bunch grass grows plentifully. The season for butter making is short; until first of June the cows eat wild onion, that gives milk and butter a characteristic taste; then the grass becomes too dry about middle of September—in dry season, sooner; so only three to four months can be calculated on, even from cows that bear calves, at suitable seasons. In the more desert parts can begin earlier, but must close earlier. On account of dry feed and scarcity of water, cows will soon have to go too far from water for feed.

17. Elko County now has all the stock it will possibly support, and for your benefit I have gotten the returns of Assessor Henry V. Mundell for 1879:

Number of horses assessed.....	18,676
Number of mules assessed.....	5,381
Number of asses assessed.....	15
Number of cows, calves, and young cattle assessed as stock cattle.....	60,000
Number of beef cattle assessed.....	36,432
Number of yoke oxen assessed.....	240
Number of sheep and lambs assessed.....	9,432
Number of hogs assessed.....	1,400
<b>Total stock</b> .....	<b>131,576</b>
<b>Deduct for hogs</b> .....	<b>1,400</b>
	<b>130,176</b>
Stockmen estimate seven sheep consume equal to one cattle; thus subtract for sixth-sevenths of the number of sheep.....	8,085
<b>Cattle it would support</b> .....	<b>122,091</b>

Elko County is about 160 miles square, or 25,600 square miles, showing that it supports only a fraction less than five head to the square mile. I think it is safe to esti-

mate that there is one-third more stock than the books show, or about seven head to each section of land. There is a vast amount of waste land in this (Elko) County, such as mountains and desert plains; yet I think it is the best county for stock in the State, and Humboldt County next, and southern counties the poorest.

18. Grass has diminished fast in all the country I have lived in, to wit, Oregon, Washington, Idaho, and this State; but as the grass gets short, growers turn their attention more to sheep.

19. I know of only one firm (Scott & Hank, of Elko County) who fence. They keep their main band of stock on Snake River, in Idaho, and drive to their inclosures in Humboldt Valley the beef cattle, and hold them until the market suits to ship. In this inclosure they breed their fine horses and fine bulls. As a general rule cattle require their liberty in the winter in this State, as by instinct, when a storm is coming, they go to the cedar trees or in gulches, if they can, away from wind.

20. I think if stockmen could buy land so that they could afford to fence, much better stock would be raised. They could grow fine stock, and a general improvement in beef would be the result. As it is now, land is too dear for that purpose, including fencing; and to turn fine bulls or fine horses on to a range, all get the use of them alike; thus the owner loses part of his investment, and soon gets discouraged with trying to improve his stock.

21. Answered heretofore; mountain springs and spring lakes.

22. In grazing or feeding sheep and cattle, stockmen estimate one head of cattle equal to seven head of sheep.

23. Growth of grasses diminishes as fast, if not faster, pastured with sheep than it does with cattle.

24. Sheep and cattle graze readily and voluntarily on some lands until grazed too close. Then the scent of the sheep left on the vegetation or herbage will cause the cattle to change; but a rain or snow seems to renovate the range.

25. The prejudices cattle-growers have toward sheep-growers is founded in the fact that when a range is pastured closely down sheep can and will readily live on shorter feed than any other class of stock, and horses next; so when the range is partly eaten out the cattle-grower must move first if there is moving necessary.

26. I do not think it practicable to herd in this State generally more than 1500 sheep in a herd, as they have to roam over too much ground to get feed; and while so scattered the coyotes, or prairie wolves, kill them before the herder can reach the opposite side of the herd.

27. Answered.

28. I have never known trouble to arise generally in ascertaining corners where I have lived.

#### TIMBER

I do not think the timber interest of this State worthy of your attention. But the same laws that govern other States would be applicable to this State, where there is actual sawing timber.

1. Answered heretofore in explaining the general characteristics of the country.

2. There is no timber planted in this country.

3. I would dispose of the public timber lands by homestead and pre-emption of 160 acres. For instance, as timber is about to be valuable, the sooner the poor man settles on it and protects it from waste until such time as he can sell it, the better. I have observed it in Oregon, Washington, and when traveling in the Sierra Nevada Mountains, in the vicinity of Truckee. I think the method as good to preserve the timber as any, and the poor man gets part of the benefit; can cut the timber and market it himself, and establish a business in accordance with his means and intellectual capacity. This policy makes competition in the timber business and prevents monopolies in timber business, thus protecting other business with fair rates that might otherwise suffer.

4. I think I would only allow timber to actual settlers, and at one price. My object in so doing is, as I before stated, to guard the consumer against monopolies and consequent high prices.

5. Forests fallen here do not grow up again.

6. In Oregon these fires generally were first set by Indians to chase the game, and made sad havoc. My remedy would be to kill the Indians and Indian agents and annihilate the Indian Bureau, the curse of all frontier countries, as well as the Indian himself. I will leave the subject of prevention to the people of the Middle States who suffer most from these destructive fires.

7. Nothing to offer.

8. Our local custom here is to possess the timber with a kind of brush fence. Idaho had a possession timber law.

9. No answer to make; have not formed opinion.

## LODE CLAIMS.

1. My main experience in lode mining was in South Mountain, Owyhee County, Idaho, as owner of argentiferous galena and carbonate ore mines.

2, 3. Not observed sufficiently to reply intelligently and satisfactorily.

4. I do not think the top or apex, the course and angle or direction of the dip of veins or ore-bodies can be determined in the early workings. I know it is wholly impossible as to contact veins. (See cuts of veins and ore-bodies, as found in different parts of the world, which you will find finely illustrated and their history explained in Von Cota's treatise on ore-deposits, written by Prim.) It is the standard history of mines of Europe. Every new mining district presents something new and peculiar to its locality.

5. I do know the rights of discoverers are not protected under the present laws; but ore-bodies are of so many shapes in different localities, and even in the same ledge or vein, that I cannot propose a law that would protect the discoverer without blighting the prospects of other prospectors.

9. The outcrops of lodes or ledge matter are sometimes wider than the lawful width, as, for instance, the "Original," located by T. M. Wessels and myself, in South Mountain, Owyhee County, Idaho, as it is different in form from anything I have heard of or seen described in Von Cota's treatise. I will give you a rough diagram here.

We located the ledge, supposed to be 100 feet wide of low grade ore, or ledge matter. It was tractable for two miles plain. We claim 3,000 feet in company, under old law, running eastwardly and westwardly from discovery stake and work. When, after years, we organized a company in San Francisco for work, Donally goes on to our ground and sinks a shaft, as marked, and finds a perfect vein running in nearly opposite directions, calls it by a new name and separate ledge, running different from our claim. The company preferred to stand the blackmail rather than litigate and buys him out. After further developments were made, we found all the true ore, valuable to work, was in these crop veins, each one running in same direction and passing through and outside of main strata of ledge matter same distance on both sides. All valuable ore-bodies in the camp were crossing this ledge belt in same way, although not generally understood, as we did not desire litigation.

I could illustrate true fissure veins, such as Comstock and War Eagle, and contact veins, such as Eureka and Ward, district South Mountain, Raymond and Ely, and Emma; but I have hurriedly consumed more time than I have space. I know as much about contact veins as I desire to know; if I knew less might recommend more. I do know that I could not propose a legislation that would prove equitable and satisfactory to me. I will, therefore, leave the subject to those who have more capacity, urging you to be cautious and examine the history of mines in Europe; ours in America are similar, no two localities exactly alike. For a period of fifteen years I have studied the nature of ore-bodies, that I might be able to work what I had intelligently, or invest in others prudentially, and have decided that relative to contact veins nothing can be judged except what is opened up and shown. Fissure veins are easier to form an opinion with regard to, and would be easier to regulate by law, for reasons of their peculiar shape, as you will readily see after looking over Von Cota's treatise on ore-deposits by Prim.

I will state that I think the present method of recording as good in practice as any I could suggest.

I would answer some more of your questions with regard to the method of locating and recording lode and placer claims, but I have already held this matter two months too long, and fear that in case you do find any facts contained herein that may be considered by you practical to adopt, the receipt thereof will be too late to be serviceable to you. The pressure of my business has caused me to put the matters off from day to day, and finally has been poorly done evenings when I ought to have been at rest.

Again thanking you for the honor conferred upon me, by soliciting my opinion, based on experience, and hoping you may have more satisfaction in conducting your labors on mines and mining than I could have, if the work rested with me,

I am, most respectfully, yours,

E. C. HARDY.

---

*Suggestions of the Hon. C. N. Harris and others, at a meeting held in the governor's office, at Carson City, Nev., relative to the best system of controlling and disposing of the public domain, and recommending such changes in legislation as may be beneficial to the people of the State.*

On the evening of the 31st day of October, 1879, a meeting was held in the governor's office, at Carson City, Nev., at which meeting there were present the following prominent citizens of the State among others, viz: His Excellency Gov. J. H. Kinkead,

Chief Justice W. H. Beatty, Deputy Surveyor-General I. N. Fassett, Secretary of State Joseph Babcock, Ex-Deputy Surveyor-General S. H. Day, ex-District Judge F. W. Cole, of Eureka, Hon. C. N. Harris, United States land register, at Carson City; S. C. Wright, receiver of United States land office; H. M. Yerrington, D. L. Bliss, Hon. James Crawford, Superintendent United States Mint, at Carson City; Hon. O. K. Stamp-ley, N. Soderberg, esq., attorney at law, and George G. Lyons, esq., private secretary to His Excellency Gov. J. H. Kinkead.

Mr. Donaldson, member of the United States Land Commission, having stated the object of the meeting and requested of all the members present a free expression of opinion and of their views in regard to the policy of the Federal Government as to the best system of controlling and disposing of the public domain within the State, and such changes in the legislation of Congress as might be beneficial to the people of Nevada—

The Hon. C. N. HARRIS made substantially the following statement :

I think there are at present too many papers and too many forms used in the land office, and I think the proceedings in obtaining titles to land from the government could be greatly simplified. It is also my opinion that all fees ought to be abolished, and that the officers of the land office ought to receive fixed salaries.

The ruling of the department to the effect that when an applicant files his declaratory statement to purchase lands, no matter whether he consummates it or not, he thereby exhausts his right to purchase and to acquire homestead, I think is wrong.

There is another rule which I think ought to be changed. In the case of the selection or abandonment of homesteads we take the proofs in the matter, send up the papers to the department, and perhaps, in the course of a year, the department sends them back. I think in the first instance, as we take the proofs, instead of recommending a decision one way or the other, we ought to be permitted ourselves to enter up a judgment in favor of the party entitled to the land. I think the register ought to have a seal. He ought to have the right to subpoena witnesses and perpetuate testimony. All mining recorders ought to be abolished, and the business ought to be put into the hands of the officers of the United States Land Office with power to appoint deputies.

At present in a mining district half a dozen persons, who may not be miners, may organize a district, and make by-laws, limiting the amount of ground which shall constitute a mining claim. They may elect somebody recorder, and the only entry or evidence we have of the claim of the miner is a copy of his record of the notice. Suppose the paper is burnt up or the recorder absconds. In such case no patent can issue. Now, if the claims are filed in the local land office, and are reported at the end of the month to the Commissioner of the General Land Office, there is a complete and permanent record. If the records of the land office are burnt up, the Commissioner has them, and *vice versa*; if the officer of the land office attempts to alter them, it is impossible to perpetrate the fraud, because it is sure to be detected, and the officer of the local land office would be prevented from attempting any alteration for the same reasons.

Here Judge COLE remarked that it would be impracticable to abolish the mining recorders, on account of the great distance, often many hundred miles, between the land office and the mining district. He said it was true that the county recorders might be appointed deputies, but that would not help the matter materially. Mining districts are generally organized very suddenly. People sometimes flock in there in great numbers in a very short time, and there have been camps in this State and elsewhere where the best locations have been made in two or three days. It is the rule in most districts that a mining recorder goes on the ground when he records the claim. I see no reason why the government should exact that the miner must go to the land office or its deputies when he locates a mining claim. The government never exacts that a man shall come to the land office when he makes a location to pre-empt agricultural land.

Mr. CRAWFORD. It seems to me that there is an easy way to obviate any difficulty in this matter. Some time ago I went down into Churchill County and located a mining claim there. I recorded it with the district recorder (that is the mining recorder there), and then I came by the county-seat, and recorded it there. A man could make a record that way.

Judge COLE. There is no law authorizing such recording.

Judge HARRIS (continuing). I think, also, that all these contests about mining titles could be tried by the district land officer. The whole matter of referring any questions of this sort to the local courts merely involves the whole proceeding in interminable trouble, voluminous, and expensive litigation, and without results that are at all satisfactory to the administrators of the Federal law. It is simply an absolute decision of the local tribunals without the intelligent adjustment by the Federal authorities of the rights of the claimants. I am speaking now principally of the questions in regard to priority of location, which is the most serious source of litigation.

Question by the COMMISSIONER. Have you heard the proposition of square locations discussed?

**Judge HARRIS.** I have talked it some myself, and conversed with a few gentlemen upon the subject. My opinion is that eventually it will be necessary to change the whole system of mining locations to that of square locations, no matter whether the ledges are perpendicular or horizontal.

**Mr. WRIGHT.** I think that system would work very badly in this State.

**Judge COLK.** It would not work in Eureka district at all. They had square locations there. The mining laws of that district at one time provided for such locations, but the system was soon abandoned as impracticable.

**Judge HARRIS.** I think the present system of patenting ledges merely postpones to a degree the precise trouble that exists and always has existed in mining properties, frauds and the like in the absence of patents.

**Question.** In getting patents from the General Land Office, how long does it take you?

**Answer.** There is nothing that will enable me to state that even approximately. It may take months and it may take years.

**Mr. WRIGHT.** That depends upon how much you can afford to send to Washington to some gentlemen there to get them to take up the case speedily. In that way one man can get his patent in a few weeks, while another man must wait for years. I think there ought to be no preference.

**Judge HARRIS.** I have heard the idea of a pastoral homestead advanced. As I understand it, it is based upon this theory: 160 acres in the Eastern States will sustain a family. It will require about 30 acres of this arid land to feed a beef, and 100 head of cattle will keep a family, and that, therefore, a man should be entitled to take 3,000 acres of such land for a pastoral homestead. That idea strikes me decidedly favorably. In fact, we must in this country, under a peculiar condition, absolutely depart from all known regulations prevailing in the Eastern States, in order to adjust ourselves to what we have. Of course no man should be entitled to such a homestead except upon arid lands.

**Another proposition:** The wealth of our State, outside of mining, is cattle. We are going to be largely a stock-raising people. I would not be in favor of any law that would drive off these great herds of cattle that are now being pastured in different portions of the State. I do not think that that industry should not be fostered because such property is generally or sometimes held by monopolies. I am not favorably impressed with the idea of leasing lands for such purposes generally, but it may be that in the course of proper legislation for the purpose of distribution of the domain that a system of leasing might be practicable. My theory is that the disposal of the public domain finally should be arrived at as speedily as practicable. I would sell all the land cheap and in unlimited quantities, and I would protect the actual settler. I would sell the timber land and on easy terms, and as required by the business interests of the State. I am hardly able to say whether I would limit the purchaser to any fixed quantity. I would grade the price of the land; the minimum price should be about \$1.25 an acre, but I think that land valuable exclusively for timber on an average ought to bring about \$2.50 per acre.

I believe that private ownership is better protection than public ownership as a rule, and for that reason favor an early disposal of the public domain. If, however, no change is made by Congress in the laws governing the disposition of the public timber lands in any other respect, I think they ought to be put under the jurisdiction of the district land offices of the United States. (Of course I do mean that the Land Office should have jurisdiction over prosecutions for the infraction of timber-land laws.) There is always a serious objection with the American people to the interference by outside officers, such as these timber agents, who now practice a system of espionage upon the people. It is anti-American. It is not a desirable officer to place anywhere; but, if you are to require the land officers to perform judicial functions, I think the matter should be placed in their hands entirely.

Again, if the government does not sell or pass a law to sell the timber lands, I think it would be wise to authorize the district office to issue permits to cut timber upon the public land, under proper regulations, so as to protect the forests. At present the ravages of fire and destruction of timber seems to be less extensive than in former years. I have never studied up that matter so as to enable me to say why this is so.

**Mr. BLISS.** I think the reason of that is that all the good timber land has been bought up, or taken up, and is held by private ownership. Up at Lake Tahoe, whenever we discover fire, no matter on whose lands, we go and put it out, or send help to put it out, right at the start, and so do other adjoining owners, because it is to our interest to prevent the spreading of such fires and save other adjoining timber.

**Mr. DONALDSON (to Mr. Harris).** What about the surveys of the public lands? Can you make any suggestions about it? Are you in favor of the rectangular system or not?

**Answer.** I am, with this modification: That a large portion of what you call arid land should be surveyed in tracts, and not subdivided. We have a great many complaints about the lack of permanent monuments on the surveyed lands. People have

to employ surveyors to go and hunt them at a great expense. There ought to be a system of permanent monuments. As to the surveys, I think they should be made more upon the suggestions coming from the wants of settlers than from any system. There should be a paid corps of men to do the surveying, and the contract system ought to be abolished.

Upon the subject of irrigation, nearly all the water that we have in the State is in the main used at present, but I think more could be irrigated by building reservoirs in the mountains and with improvements in science of irrigation. I should undoubtedly favor a national or State system of irrigation. I think the national government should give to a man as reward all the land that he irrigates. I think some improvements could be made in the township plats, furnished by the surveyor to the land office. Such plats ought to contain an accurate topographical description of the land. The deputy surveyor could take a barometer with him when he goes to survey the land to enable him to give necessary information about the climate. If he was a paid surveyor and took more pains than at present he could tell you the altitude of the mountains and the plains and define that on the map. That would at once classify the lands. We are called upon interminably to give information to people at a distance as to the character of the domain where there are vacant lands, &c.; and we are wholly unable to give any reliable information. We see simply upon the maps squares of lands. We are unable to tell from any topographical description what is the character of the land, and whether available for settlement, and it is peculiarly necessary in order that the land office may serve its proper papers that we should have these topographical features.

Mr. BLISS. They lay down streams on the map and some of them will only have water in them two or three months of the year.

Judge HARRIS. On these maps there are to some extent statements as to what is meadow land and mountains and the like.

The present system of disposing of the public lands I regard as wholly insufficient. I am unable to say whether the State has realized anything out of the sales of lien lands which have been sold here, on some of which the purchasers have paid 20 per cent. and afterwards abandoned them. It has been suggested that the general government should give to the State in lieu of the sixteenth and thirty-sixth sections a smaller amount of land, to be selected by the State giving the State scrip for such lien lands.

Governor KINKAD. The last legislature petitioned Congress to give to the State two millions of acres instead of the grant of the sixteenth and thirty-sixth sections, which amounts to upward of four millions of acres, allowing the State to select such lien lands.

Mr. HARRIS. If I remember our records correctly, scarcely any of those lien-land selections have been as yet confirmed to the State of Nevada. I am unable to say what the reason of that is.

Another thing: The land officers ought to receive official notice of the issuance of patents. In the records of the Land Office there is a column headed date of patent, but we seldom receive official information of the issuance of the patent. I have one instance of that. It is said that the Scorpion patent was issued some time ago, but we knew nothing about that officially.

Mr. YERRINGTON. Have you received notice of the issuance of the Fairfax or Vermont patent? They have received one recently.

Answer. I have never received any notice of any.

Question (by Mr. DONALDSON). What other suggestions can you make in regard to the public lands. Give us any ideas of your own on the subject.

Answer. I don't consider Nevada an agricultural State. It is mineral and grazing; agriculture is incident. I think the government ought to take measures looking mainly to an early and final disposal of the whole domain, and I think it ought to all be surveyed except running the subdivisional lines of the township. I think all these questions about the pasturing of cattle and the use of water ought to be settled under the existing law of Congress; the first appropriator has a right to take the water for beneficial purposes. There ought to be a law requiring the purchaser of land to pay for the same within a certain time or abandon it. I would make the limitation about one year. I think the Land Office should have jurisdiction to prescribe the terms and conditions under which one partner in a mining claim may sell out the rights of his co-owners, and the notice to be given in such cases. No other suggestions appear to me at present.

*Testimony of J. C. Cooney, Fort Bayard, N. Mex., relative to lode claims.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

FORT BAYARD, N. MEX.,  
December 15, 1879.

*Public Land Commission, Washington, D. C. :*

## LODE CLAIMS.

1. Miner and prospector for nine years.
2. No two men construe the United States mining laws alike. Sections 3 and 14 conflict, which is one of the greatest causes of litigation.
3. The filing of surveys of lode claims which overlap on the surface should be discontinued.
4. The top or apex of a vein or lode is the width of the vein or lode on the surface; but the United States mining laws means the top or apex to be the width of the claim, 600 by 1,500 feet. (Section 3.) The dip of a lode cannot be determined in the early workings of the lode. A vein dips more the first 200 feet from the surface than after. A vein will dip more when carrying metal than when it is barren.
5. No; the rights of the discoverer are not properly protected under present laws. Subsequent locators beat the discoverer in all cases. We owe all the discoveries of mines and new mining camps to poor men, and the men of means beat them out of their rights.
6. Litigation does not grow out of not being able to determine the dip of a vein; it grows out of sections 3 and 14. Section 3 gives all the surface and all below the surface; section 14 allows the subsequent locator to follow the vein under the surface of the prior locator's claim until he strikes the vein of the prior locator's claim, &c.
7. Yes, often; and the contest settled with rifles.
8. Yes, if he had not a good rifle.
9. I don't think there are five claims in the United States wider than the legal width, and they can't be called veins or lodes; it is a multiplicity of spurs or seams.
10. Yes. Crossing a deep gulch or cañon they will run at right angles on each side of the cañon. A vein of over a foot will not run outside of the side lines in 1,500 feet.
11. It works to the disadvantage of a poor man under present law.
12. If A is a poor man and B is wealthy; A has no means of going to law, and B gets his claim.
13. Yes; not only from the dip, but from cross-lodes and spurs or seams running out of the mother lode. Subsequent locators locate those cross-lodes or seams across the prior locator's claim, in accordance with section 14, and they work the prior locator's ore if the prior locator is not rich enough to sink down or drift to prove that they are on his lode.
14. If a locator has 300 feet on each side of his vein, he should not be allowed to follow the dip. There is not one vein in a hundred that will dip so much as to pass outside of perpendicular lines drawn down from the side lines in less than 3,000 feet, and it has been proven that veins do not pay for working below that depth. Limestone deposits are different, and the metal lies in all shapes and forms.
15. Yes, it was done in the district formed by miners and mine-owners only. A president and secretary were appointed and one blank book furnished, the boundary lines of the district established, and the amount of work required or depth of a shaft or length of a drift to be drove to constitute one hundred dollars' worth of work. Cutting down claims and district recording is becoming obsolete. We record in the county in which our claims are situated.
16. The effect of a record in the county is good as far as I know. The mode of taking up claims are all about the same. The vein is described by prominent objects and adjacent lodes that are well known; the papers are made out on the ground and signed by the locator and witnesses, and a copy of the same sent to the county clerk for record.
17. Yes, if changed to the land office.
18. Yes; I have known district records to have been destroyed. The security is to have no district records; to have it in the county or United States land office.
19. The initiation of record title should be placed exclusively with the United States land officers.
20. Yes; I think it would be more satisfactory.
21. SEC. 3. That the locators of all mining locations heretofore made, with 300 feet on each side of the vein or lode, or which shall hereafter be made on any mineral vein lode or ledge situated on the public domain, their heirs and assigns, where no adverse claim exists at the passage of this act, so long as they comply with the laws of the

United States, State or Territorial, not in conflict with said laws of the United States, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes, and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward perpendicularly; and provided further, that nothing in this section shall authorize the locator or locators, possessor or possessors of a vein or lode which extends in its downward course beyond the perpendicular lines of his or their claim to enter upon the surface or under the surface of a claim owned by another or others.

22. I think five years is long enough. No locator or locators should be allowed to locate more than four claims of mineral land on the public domain. I have known men to locate from 20 to 100 claims in one district, thereby keeping men out of claim, that would work them. Claims should not be cut down below 1,500 feet long, with 300 feet on each side, side lines parallel with the general course of the vein.

I remain, very respectfully, your obedient servant,

J. C. COONEY,  
Fort Bayard, N. Mex.

*Testimony of N. J. Hall, Colfax, N. Mex., on agriculture and timber lands.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. Cattle raising.
2. Have lived in the county of Colfax, Territory of New Mexico, eleven years.
3. Have taken steps to acquire title to the public lands of the United States by homestead and pre-emption.
4. None.
5. My personal experience has been, I have not received a title yet, after the expiration of over a year since the receipt of duplicate. Expenses of procuring pre-emption title, \$72. I know of parties who have received duplicates over two years ago, and have not received patents yet. I do not know of any contested cases.
6. Yes. In the great distance we are removed from the land office, making it difficult and expensive to reach it, and rendering it almost impossible to get there to make final proof in case of sickness or lack of means. Remedy, allowing final proof to be made before a justice of the peace or notary or other officer qualified for the purpose.
7. Public land in Colfax County is pastoral altogether in the eastern part of the county, with but little timber, with some agricultural and mineral land in the western part. Western part mountainous; eastern, plain cut with some cañons.
8. By general rule, in agricultural land, of water sufficient for irrigation.
9. Think that the surveys had better follow the cañons and streams, as the land outside is utterly worthless for farming and hardly worth paying taxes on at 10 cents per acre.
10. Allowing the homestead and pre-emption laws to remain as they are, and selling the pastoral lands adjoining homesteads and pre-emptions to actual settlers at a low figure.

AGRICULTURE.

1. Climate, dry; temperature moderate; rainfall very light; length of seasons for farming not to exceed five months; snow-fall in the winter very light on the plains, heavier in the mountains. Supply of water for irrigation very limited, all being supplied from small springs; think not enough east of the Maxwell land grant to irrigate 2,000 acres.
2. Generally June and July, and this in showers, as we hardly ever have a general rain. The supply does not come when most needed for irrigation.
3. None.
4. One acre in one thousand.
5. Wheat, oats, corn, and vegetables.
6. Cannot say, as I have never made any trial.
7. Spring entirely.
8. Think the irrigation injures the soil to the extent of destroying its fertility in the end—the irrigation from springs. None so high but crops can be raised on it, if tillable land, and some crops succeed better at a high altitude.
9. There is no water returned to the streams in this section.
10. All the water has been taken up under the homestead and pre-emption laws where surveyed.
11. None.
12. All except what can be irrigated.
13. No; without there is living water, and then under the present homestead law, with the privilege of buying more around it at a low figure.

14. Yes; if it could be put at a price not to exceed 15 cents per acre. No; but give every settler the first chance to buy the land adjoining him.
15. Full fifty acres; fully up to the average.
16. Three hundred head.
17. About seven or eight.
18. Yes.
19. Yes; in part. They can, if not overstocked.
20. Yes.
21. Springs and standing water.
22. Two, as they tramp out more than they eat.
23. It has diminished, and in many places entirely disappeared.
24. The cattle will leave without they are compelled to stay; if compelled to stay, will die.
25. There is a party feeling between them, but no conflict; but there is a liability for one at any time.
26. Cannot say; sheep from two to four thousand; cattle run loose.
28. No, as it has just been surveyed.

## TIMBER.

There is but very little in the east end of the county.  
 Think there ought to be some rigid law in regard to setting on fire timber or prairie land.  
 No mineral lands in this part of the county.

N. J. HALL.

*Testimony of William Lee Thompson, merchant and farmer, Upper Membris, Grant County, N. Mex., relative to agriculture and timber lands.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. William Lee Thompson, merchant and farmer, Upper Membris, Grant County, New Mexico.
2. Some thirty years.
3. The land I now live on, under the homestead act.
5. Cost for advertising, \$10; traveling expenses, 100 miles, \$50; 160 acres homestead in full, fees, \$42; total, \$102.
6. The enormous amount of writing and advertising should be done away.
7. Very little agricultural, mostly mineral and pastoral lands.
10. I would suggest that the small valleys in these Territories be immediately surveyed, so that actual settlers can obtain title. I believe no other lands should be surveyed. I notice most of surveys made in this Territory have been made on barren plains of no earthly use for any purpose (very easy to survey).

## AGRICULTURE.

1. Climate fine, very little rain or snow; frost comes October 18 to 25; we farm it all winter.
2. December, January, and July.
3. None.
4. About not one acre in 5,000,000.
5. Corn, wheat, barley, and oats, and garden vegetables.
7. Some small creeks and the Big Grande, which is dry now for some 300 miles.
8. Irrigation enriches the land, leaves a sediment. About 6,000 feet.
9. Three-fourths taken up, balance goes to the streams.
11. No legal conflicts have as yet arisen.
12. No lands have been entered for pasturage, as no law would give enough.
13. Six hundred and forty acres is a very small farm for a pasture for a very small family.
14. Not limited.
15. Five acres, about, for this Territory.
16. One hundred and twenty head.
17. One.
18. About the same.
19. No fences; no fences here.
20. They would not.
21. From springs and creeks (very scarce).
22. Seven.

23. Grass does best with cattle.
24. They do here, but to advantage.
25. No conflicts as yet.
26. One hundred to five hundred cattle; 100 to 2,000 sheep.
28. Seldom a survey can be traced here; surveying is very poorly done.

## TIMBER.

1. No timber within 12 miles.
2. Cottonwood and willow chiefly for fences; 20 miles up the stream some scrub pine grows, which are used for houses.
3. All timber lands are needed for the settlers.
4. No real timber lands in this section.
7. I am in no way interested in timber cutting, but believe any one who will manufacture lumber in this county is a benefactor.
8. They cut for real needs of settlers.
9. Any suit commenced against any one for cutting timber would be a public damage.

*Testimony of George Gray, of New York, N. Y., relative to the public lands and surveys.*

Before the Public Land Commission, Washington, December 11, 1879.

ABSTRACT OF POINTS PRESENTED ORALLY BY GEORGE GRAY, COUNSELOR AT LAW.

1. The present system of surveying the public lands has been in operation three-quarters of a century. It is "the American system." It has the confidence and appreciation of the people. It is simple, certain, and precise. It avoids that most harassing and fruitful source of litigation arising under all other systems—namely, conflict of boundaries. It is the best system that can be devised to meet the wants of an agricultural people, which the Americans pre-eminently are and are to be.

2. The region west of the one hundredth meridian, or the Missouri River, and north of the forty-fifth parallel is agricultural, mineral, or timber land. These agricultural lands do not anywhere require irrigation or special treatment to render them productive. The mining laws require amendment to give precision to claims and certainty to titles. This can, to a great extent, be accomplished by confining rights below the surface to perpendiculars from the superficial boundaries. The present system of surveys is well adapted to the timber lands. The land-laws should be so amended as more effectually to protect the timber lands from spoliation under cover of homestead and pre-emption entries. This, with persistency in the efforts now made by the Interior Department for the preservation of the timber on the public lands, is all that is required. Sales of timber or of lands chiefly valuable for timber, may be as advantageously made, for the purchaser and the government, under the present system of subdivision as any other; but such sales should be to the highest bidders or at an approved valuation. All agricultural lands should be open for sale by private entry, in quantities not exceeding one section, and until so entered they should remain subject to occupation and settlement under the homestead and pre-emption laws.

3. Through the region above outlined the Northern Pacific Railroad is being constructed. From the Missouri River, in Dakota, to the Yellowstone, in Montana—about 220 miles—the road will be completed and in operation in 1880, and within the same time about the same length of road—from the Columbia River, in Washington Territory, to Lake Pend d'Oreille, in Idaho—will also be completed and in operation. As an evidence of the perfect adaptation of the present system of surveys to the wants of the people, and of their confidence in its certainty and security, it may here be stated that, in anticipation of this early completion of those two divisions of the railroad, many hundreds, or rather thousands, have already settled on the agricultural lands within the limits of the grant. Where the lands are surveyed the government reserved sections are occupied to as great an extent as are the alternate odd sections. Where the lands are as yet unsurveyed the settlers are opening farms with equal feeling of security, since the railroad company offers all agricultural lands in the odd sections west of the Missouri River at the uniform price of \$2.50, cash, per acre to actual settlers; so they are fully protected whether afterward they are found to be on odd or even numbered sections. The present system of surveys is well understood, and it fulfills every requirement.

4. The Gulf States containing public lands are, like the region north of the forty-fifth parallel, adapted for agriculture, and both regions are alike capable of sustaining large populations.

5. The intermediate belt embraces vast extents of fertile lands, bountifully supplied

with all natural sources and means of productiveness; but in certain other portions of this central region, while the population, if any, continues sparse, surveys will not be required for some time. Persons engaged there in cattle raising have the free use of the public lands for grazing purposes, and the government is not thereby a loser; and every one employed in the business having the necessary qualifications can have, under existing laws, 160 acres of land for cultivation, the title to which he can obtain when the surveys are made.

6. So long as there remain, as there are, large areas of the public lands naturally suitable for cultivation—not requiring irrigation or other artificial expedients to render them productive and involving the expenditure and investment of large capital—the question of how to survey or dispose of the “arid desert” is not now a practical one. But even as to the desert lands, the present system of surveys by fixing standard parallels, base and meridian lines, will give established points of departure for subdivisional surveys when required. The extension of the system to this extent over the plains will be necessary in due time for the continuity and completion of the geographical survey of the country.

7. The present system of surveying the public lands was adopted after the Louisiana purchase, and was not designed for the Atlantic States merely. It was founded in wisdom and forethought, perfected in over seventy years of practical operation, and has grown into the very life of the people. It has aided in giving happy and prosperous homes and honorable means of livelihood to millions, as it will to the hundred millions of citizens who are to occupy the western portion of the United States. There seems to be no sufficient reason for revolutionizing the system which has given and is capable of giving such results.

GEORGE GRAY.

*Testimony of J. W. Belknap, farmer, Lake County, Oregon, on agriculture and timber.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

*Gentlemen of the Public Land Commission:*

I have before me questions directed to me with request to answer the same, which I will so as far as I am able.

1. J. W. Belknap, Summer Lake, Lake County, Oregon. Am engaged in stock-raising and farming.

2. I have lived in Lake County five years; in the State of Oregon thirty-one years.

3. I tried to acquire title to land under the pre-emption laws, but failed on account of not being able to make the payment as required by law.

6. I have observed defects in the public-land laws.

7. The public lands in this country are mostly mountains, fit only for pasture and timber. Perhaps one-hundredth part of the land is fit for agricultural purposes.

10. I think actual settlers in the mountain regions, where the land is principally pastoral, should be allowed more land than is allowed by existing laws.

#### AGRICULTURE.

1. The climate cold in winter and changeable in summer. Supply of water for irrigation moderate.

2. The rainfall occurs between the first of November and the first of May in the winter. There is but little rain when most needed for irrigation.

3. About one-half of the land cultivated requires irrigation.

5. Wheat, barley, and oats are the principal crops.

6. About 200 inches of water will irrigate one hundred acres of wheat.

7. The water that could be applied to irrigation is mostly small creeks or spring branches coming down from the mountains.

9. In my section, water has not been taken up to any extent. Settlers claim the water that runs through their land; will not allow it taken out unless returned to the channel before entering their land; do not know under what law it is claimed.

12. About three-fourths.

13. It is; each settler should have not less than 320 acres.

14. If these lands were put in the market, the quantity to each purchaser should be limited.

15. From 3 to 4 acres.

18. The growth of grass has diminished. Think there is about 150 head to the square mile.

19. Cattle owners do not fence their range; think they could be confined with safety.

20. Yes.

22. Ten head of sheep are equal to one beef; diminished the same as land pastured with cattle.

24. No, not to any extent.

28. There is some trouble in finding corners; they are not properly marked.

#### TIMBER.

1. There is abundance of timber, mostly yellow pine; very poor for general purposes.

3. By sale; do not think it should be higher than agricultural land.

5. There is a second growth of same character.

7. There has been no unnecessary waste of timber to my knowledge in this section.

J. W. BELKNAP.

*Testimony of S. Coffin, register, and Caleb N. Thornburg, receiver, United States land office, Dalles, Oreg., relative to agriculture and timber, lode and placer claims.*

#### AGRICULTURE.

1. Mild and healthy. Rainfall principally in fall, winter, and spring. Snow in January and March. Irrigation not generally needed.

3. A greater portion.

5. Very little irrigation needed.

6. Don't irrigate wheat.

8. Crops are raised at a high altitude.

12. Over one-half.

13. Yes; six hundred and forty acres.

14. No.

16. About one hundred and fifty head.

18. Diminished.

19. No.

21. Various streams.

23. Diminished.

24. No.

25. Many disputes, but nothing serious.

27. All road companies who have lien lands should be compelled to select them and let the balance now withdrawn be opened to settlers. If any grants to railroads, such as to North Pacific, are extended, the lands should be sold to actual settlers at \$1.25 per acre in entire quarter sections only, and the money placed to the credit of such companies.

28. Yes.

#### TIMBER.

1. Principally pine, fir, and oak. Cannot well estimate the proportion of timber land; but say one-twentieth.

2. Locust and poplar. Think pine, fir, and oak would do well.

3. Sell under the present law.

5. Young timber starts immediately and grows thriftily.

6. Generally started by carelessness of Indians.

7. Timber depredations in this district not extensive; principally by settlers for necessary fuel and for fence and building purposes.

9. Place the guardianship of timber lands in custody of United States district land offices, with power to arrest, &c.

#### LODE CLAIMS AND PLACER CLAIMS.

There are but few mining claims in this district. We have not had any experience in mining-claim entries.

Respectfully submitted.

S. COFFIN,

Register.

CALEB N. THORNBURG,

Receiver.

*Testimony of George B. Currey, lawyer, Canyon City, Grant County, Oregon, on agricultural, pasturage, and timber lands, mining laws and claims.*

CANYON CITY, GRANT COUNTY, OREGON,  
January 15, 1890.

*Public Land Commission, Washington, D. C. :*

SIR: A circular containing numerous interrogatories concerning the operations of the United States land laws by some means has found its way to my table.

In response to first series of questions, by number, I answer as follows:

1. My name is George B. Currey; by occupation, lawyer.
2. Have lived in Oregon 26 years.
3. As attorney I have had something to do in procuring titles for clients of nearly every grade of land—agricultural, saline, mineral, homestead pre-emption, and desert.

In answer to question 6, I say: 1. The rights of administrators or executors is not clear as to homestead claims where no heirs enter and take possession of the claim, leaving it questionable if administrators can perfect title. 2. In most new countries, where land districts are large, it works a hardship to compel pre-emptors to appear in person to make final proof. There ought to be some means inaugurated whereby the distance between the Department of the Interior and the Department of Justice could be abridged. The effect of the present encasement of each department in its own peculiar shell renders perjury in making entries and final proofs under homestead, pre-emption, desert, and timber-culture laws a thing of easy and safe accomplishment. Rich men constantly are in the habit of procuring the service of their hired men to take up claims, perfect title to parts of the public domain, and then transfer to their employer. A law prohibiting the transfer or lease of a pre-emption claim for, say, five years after receipt of patent at the local land office might have the effect to stop the present practice.

7. This is a mountainous country. It has a considerable amount of mineral, gold, and silver lands; about one-tenth of the surface plowable, the remainder high lands, cut up with steep cañons and rocky ridges, good for grazing purposes. There is a timber belt following the trend of the Blue Mountains, about fifty miles wide and hanging on either side of the summit ridge.

No geographical division would classify the lands of this country. The classification must be made, if made at all, from the qualities of the land as found upon observation made with intelligent and honest eyes.

The present system of surveying will produce a more satisfactory means of designating lands than any other. Township the whole county, sectionize the timber lands on the lower rim and adjacent settled valleys, and as applications are made to purchase subdivide. The high lands had better be held for some years subject to the homestead and pre-emption laws.

Any scheme to lease or otherwise dispose of the grazing lands will retard the settlement of the country and keep out actual homestead and pre-emption settlers, while those who obtain possession of the grass lands will stock the same to their uttermost capacity, and in a few years, after having rendered it worthless, throw up their lease and abandon the country, denuded of grass and timber, a sterile waste, where no man can make a living until years of recuperation have intervened.

If held subject to homestead and pre-emption, lands which are now held in the estimation of the local population worthless, as immigrants crowd in will be found not only desirable, but valuable.

There is, in my opinion, no better way, both for government and people, than the homestead laws, with some better guards against loose swearing.

This is a dry climate. The annual waterfall, including snow and rain, does not exceed 12 inches annually. The air is very arid. The greater part of the rain falls in early winter and spring, with intervening snow. The supply of irrigating water is from the melting snow in the high mountains.

It is now thought that no part of this county will produce any crops without irrigation. This, I think, is a mistake, as I am satisfied that good crops of fall-sown wheat and rye can be raised on the uplands having a hard-pan or clay substratum.

There is but a very small proportion of this county that can be irrigated on account of its altitude above the beds of the creeks. Wheat, oats, barley, corn, and garden vegetables of most kinds are grown here with satisfactory yields by aid of irrigation. My experience is that unless the subsoil is clay, irrigation soon drains or leaches by percolation the fertility out of the soil. It will take about 100 inches of water, miners' measurement, to irrigate 100 acres of wheat; if the soil is loose and based on gravel it will take much more.

Very little water returns from the irrigating ditches to the original streams; it is absorbed by the soil or lost by evaporation. There is no statute of the State of Oregon changing the common law as to the appropriation of water. A sort of a local custom prevails here similar to the practice under the statutes of California.

My judgment is that it is best not to put the lands on the market at private cash entry. The ingenuity of the law-makers can devise no effectual method of limiting the amount one man can procure with cash.

The area of this county is so large and settlers so sparse that I have no means of forming an estimate of the space required to keep a single animal, but guess that a cow will eat all that grows upon ten acres in the course of a year.

In the vicinity of settlements and stock ranches grass has diminished amazingly in the past five years.

Cattle-raisers here do not fence in their range.

Sheep and cattle will not graze on the same ground. The stench from sheep is repugnant to the cattle, and they will not remain on the ground over which sheep have passed.

Sheep and cattle men have thus far in this county got along without doing much more than to curse each other and make some threats. Killing will commence next spring. As far as finding the marks, mounds, stakes, and stones of the United States deputy surveyor who surveyed this county, the thing cannot be done. This country was surveyed on paper, with just enough field work done to keep jobs from overlapping. No settler ever pretends to know where a corner is or ever was. Private surveyors who keep certain starting corners up are relied upon to find out where the United States deputy surveyors ought to have put the corners.

The forest timber of our timber belt is pine, fir, tamarack. Along some of the creek cottonwood, alder, and birch may be found.

The mining laws for the disposition of placer and quartz lodes are rather complex, but seem to give satisfaction.

I would suggest that there might be some limit to the number of claims one man can take up under the United States mining laws.

Very respectfully,

GEO. B. CURREY.

*Testimony of Lyman L. Hawley, stock-raiser, Silver Lake, Lake County, Oregon, relative to swamp land, pre-emption and homestead claimants, homestead law, pre-emption law, land, grazing lands, and agriculture.*

*To the Public Land Commission :*

1. Lyman L. Hawley ; am a stock-raiser ; have lived in the State twenty-six years, in the county seven.

3. I have applied for State title to 200 acres of swamp land. I don't feel sure that I will ever get it, as I don't believe the State has located it according to United States land laws.

5. The expense on uncontested land is just what the law prescribes as fees and values. On contests with the State in swamp-land cases, United States pre-emption or homestead claimants, the expenses have been heavy and decisions delayed, and the whole of the business very detrimental to the actual settler. Other contests are settled promptly with little expense to parties.

6. I would say that the homestead law should be so amended that the settler could acquire title to as many locations as he lived full required time on, and abolish the pre-emption law. There is a class of people who keep on the frontiers all their lives and should be provided with a home as often as they choose to move ; they are the only people fit to make the first improvements and fit the country for a more dense population.

7. I will confine my remarks to this county, which is made up of lake basins with low mountains covered with a poor quality of pine timber ; there is some swamp land on nearly all streams that empty into the lakes, and two or three large marshes could be drained. There is a small portion of agricultural, a much larger pastoral, and still larger part is timber and worthless desert. The timber will never have other than local value.

8. The character of lands can only be ascertained by the surveyors.

10. Land in this section being principally grazing should be leased in lots of from one to ten thousand acres for twenty years at a time for a small sum ; at the expiration of such lease, if not applied for by settlers, re-lease it to the same parties.

#### AGRICULTURE.

The climate is cold and frosty ; rainfall is light ; snowfall in winter is sufficient to supply water for irrigation. The snowfall is from November to March.

3. A very small proportion.

4. There are some large tracts of sage-brush land that may be cultivated by irrigation.

5. Small grain and hardy vegetables.
7. The supply of water is abundant.
10. There is little State law on water rights; all water must be used or returned to its natural channel.
13. If homesteads are made on pasture land in this section they should contain at least 5,000 acres.
14. If lands are placed in market the sale should not be limited, as speculators will find means to purchase what they want.
15. It will take ten acres of irrigated or farming land or 50 acres of pasture land to make sufficient grass for a beef.
16. A family could be supported with 100 head of cattle if we could get title to lands and improve the same; as it is, the best is very risky.
17. About sixteen.
18. Diminished. We have had too much stock.
19. Good pastures for winter would be a great help to the stock-raiser.
20. Yes; decidedly.
21. Plenty.
22. Eight head.
24. Yes, if cattle are not wild.
25. None exist.
26. Cattle are owned in bands as large as 3,000 head; sheep are herded in bands of 1,500.
28. The corners were never set according to law, and are hard to find and determine.

## TIMBER.

8. We take all we want for improvements. The timber that is cut belongs to the man who cuts it.
9. No; not in this section. We would take what we needed anyhow on the coast. Where timber has a commercial value it might be better to place it in the hands of aid officers in order to stop milling on government lands.

## LODE CLAIMS.

None.

I humbly submit these few points to your consideration without argument or reason for want of time to write more.

Yours,

LYMAN L. HAWLEY,  
*Silver Lake, Lake County, Oreg.*

*Testimony of D. D. Munger, farmer, Jordan Valley, Baker County, Oregon, on agriculture and timber.*

The questions to which the following answers are given can be found by unfolding page opposite page 1:

1. My name is D. D. Munger; residence, Jordan Valley, Baker County, State of Oregon; am a farmer.
2. Have lived on this coast over thirty years; in Oregon twenty-two, and in this valley fourteen years.
3. I sought to acquire title to 160 acres of land in this State about sixteen years ago under the pre-emption laws, but when I appeared at the land office, 80 miles distant, I was informed by the register and receiver that the land I wished to pre-empt had been withdrawn from disposal two or three days previous to my arrival at the office; and again in February, 1874, I made application for a homestead on the land that I have been living on for over ten years, but the receiver at Linkville rejected my application, as well as other applications, for the reason that I had a settlement on the land prior to survey, but advised me that I had a right to file a pre-emption on my land claim, which I did; but afterwards one of my neighbors wrote to the Commissioner of the General Land Office respecting the rejection by the receiver of our homestead applications, and the Commissioner reversed the decision of the receiver, who then advised me that I could change my pre-emption filing to a homestead entry, which I subsequently did.
4. I have been deputy county clerk of this county for the last six years, and have prepared homestead and pre-emption papers for nearly all the claimants in this part of the county.
5. As to this question I cannot answer correctly, as there have been no titles to public lands perfected in this part of the county, although one of my neighbors attempted

to make final proof of his homestead entry before the judge of our county court (which is a court of record), and sent a notice to that effect to the officers of our land office at Lake View to have it published, but the register informed him that he could only have the evidence of his witnesses taken before the judge, but would be required to appear in person at the land office to make his final proof, which decision, I think is not consistent, according to the act of March 3, 1877.

6. I see no provision made to carry out the act of March 3, 1879, for having notice published for final proof of a homestead or pre-emption being made at any other place except the land office in case parties living at a great distance from such office, or from bodily infirmity, or other good cause, wish to make it before a judge or clerk as contemplated in act of March 3, 1877. There are many settlers living at a great distance from their local land office, and in this and other new countries they frequently live a long distance from their county-seat, as in our case. We live over 200 miles from our local land office and over 160 miles from our county seat, and in most cases the roads to these places pass over an unsettled, mountainous country, many times unsafe to travel over during the winter snows or spring floods, and the traveler at any season of the year is liable to meet with roving bands of hostile Indians; and as there is no law to compel the attendance of witnesses in case a claimant wishes to make final proof on his homestead or pre-emption, or in a contested case, it is liable to subject the applicant for a homestead, claimant or contestant, as the case may be, to great dangers and inconvenience, and to a heavy expense; and as the settler is likely to be poor, it might cause him to lose his land. I would therefore suggest that the act of March 3, 1877, "to amend section 2291 of the Revised Statutes of the United States, in relation to proof required in homestead entries," be so amended that where a claimant for a homestead, pre-emption, or other class of lands is prevented, by reason of distance, bodily infirmity, or other good cause, from personal attendance at the district land office, that the final proof required of the claimant, or any testimony required in a contested case, or any affidavit or testimony required under any of the land laws of the United States, may be taken before any judge or clerk of a court of record of the county in which the land is situated, or before any notary public residing in such county, such affidavit or testimony to be certified to under seal. Provided, further, that where such claimant, contestant, or an applicant for a homestead, from a like cause, is prevented from personal attendance at the district land office and also from personal attendance at the county seat of the county in which such lands situate, such affidavit or testimony may be taken before a justice of the peace of such county, duly certified to by such justice, whose official character and genuineness of signature should be certified to under seal.

I would also suggest that the act of March 3, 1879, entitled "An act to provide additional regulations for homestead and pre-emption entries of public lands," respecting the publication of notice of intention to make final proof, be so amended that such notice shall designate the place where, as well as time when, such proof will be made and that there be proper blanks prepared for cases where such proof is to be made at other places except at the land office.

There are large amounts of land in the United States which have been granted for various purposes which have not yet been selected by the grantees; and as they are paying no taxes on them, but the pioneer who is making these lands more valuable by making valuable improvements in proximity to them, and are required to pay taxes to help support the government which protects these lands, and while these lands are not selected, it retards the settlement of the country. I would therefore suggest that where any lands may have been granted to any State, Territory, corporation, institution, or otherwise, for the benefit of any railroad, wagon-road, or other improvement, and where such lands have been surveyed, and where such rights have attached, that such grantee or grantees be required to select such lands within two years; but where such rights have not already attached, or where such lands have not been surveyed, then within two years from the time such lands are surveyed and such rights have attached; but if not selected within such time they shall be subject to disposal by the United States under the same rules and regulations as other lands under either the pre-emption, timber, desert, or any other land laws of the United States in force at the time of disposal, whereby such disposal is for money; provided, however, that all moneys paid to the United States for such lands shall be subject to the order of such grantee or grantees after deducting expense of sale and all other necessary expenses, but at any time prior to the disposal of such lands as provided they may be selected by such grantee or grantees, or by their legal representatives, and that all lands which may be hereafter granted in aid of any railroad, wagon-road, or other improvement, and not selected within two years from the time the land is surveyed and the rights of the grantee have attached, shall revert to the government, and that the records of all land offices of districts within which any such lands are situated shall show such lands as have been already granted shall have become subject to disposal as provided, and also when lands which may hereafter be granted shall have reverted to the government.

The act to encourage the growth of timber on the western prairies only allows one-fourth of any one section being taken under it, whereas the homestead law allows the entire prairies not otherwise appropriated to be taken as homesteads. I would by all means encourage the growth of timber and allow all prairie lands to be taken under that act under proper restrictions, for timber is the great need of the prairies.

7. I live in the southeastern portion of the State; have traveled over a great portion of the State. The Coast and Cascade ranges of mountains (which are generally heavily timbered with pine, fir, cedar, &c.) run the entire length of the State parallel with the coast, with the valleys of the Willamette, Umpqua, and Rogue Rivers between them, besides various smaller valleys on streams running from these mountains. The foothills and parts of the valleys between the Coast and Cascade ranges of mountains are covered more or less with oak, pine, fir, cedar, and various other kinds of timber, well watered, and the valleys are a good agricultural and the hills are a good pastoral country, but pretty badly eaten out by sheep. Some gold placers and some gold and silver bearing rock, and in the Coast range some iron ore and coal and copper. In the northern half east of the Cascade range is the Blue Mountain range, running northeast and southwest across Eastern Oregon, which are generally heavily timbered with pine, fir, cedar, tamarack, &c., with some gold in places along some of the streams and some gold and silver bearing rock. Between the Blue and Cascade Mountains and the Columbia River, on the north, is a triangular-shaped country, mostly table-land, destitute of timber and covered with either bunch-grass or sage-brush, except the valleys, which were originally covered with rye or red-top grass. A good pastoral country, with some small valleys of rich agricultural land. A good many sheep, which have eaten out the grass so as to render it unfit for other stock. No mines, except a little gold in the sands of the Columbia River.

East of the Blue Mountains, hilly, rolling, and mountainous, with some valleys of rich agricultural land; timber on some of the mountains; hills generally covered with good bunch-grass; about the best pastoral part of the State; in some placers, some gold and silver bearing rock. South of this country to Nevada line, rolling, hilly, and mountainous, with long stretches of plains varied with bunch-grass, sage-brush, greasewood, alkali, rocks and sand, and on the hills and mountains bunch-grass, craggy rocks, and in a few places juniper timber, but no other; good grazing country considering the amount of barren waste land, which is about two-thirds or three-fourths of the whole; no mines, and but very little agricultural land; too much frost to raise fruit or tender vegetables.

8. I hardly know what would be the best method.

9. It might perhaps be a good plan that when settlers have settled in narrow and perhaps crooked valleys, bounded by hills, or mountains, or rocky plains, or alkali, or sage-plains, to have it surveyed so as to have the lines follow around the edge of the agricultural land as near as might be, but not to lose sight, however, of the sectional lines, as it frequently happens that a sectional and other lines run so that in order to get 160 acres, or perhaps less, of agricultural land, that a person is required to purchase eight or ten subdivisions.

10. I have no suggestions to make on this head.

#### AGRICULTURE.

1. The climate in this part of the State is variable. In the valleys as a rule very cold at short intervals during winter, moderately warm in summer, but subject to frost; no rain to speak of from first of May to first of November; generally occasional rains in March and April and in November and December; a little snow in winter, but in the high mountains much more rain and snow. Some years scarcely any snow or rain; other years there is liable to be heavy and long rains in spring and autumn, and deep snows in winter. About enough water to irrigate what little agricultural land here, but in many instances rather expensive building dams and ditches to get the water where needed.

2. Rain does not fall when most needed for irrigation.

3. None in this portion of this State with success.

4. Very little; say from one-fiftieth to one one-hundredth part.

5. Barley, wheat, potatoes, a little cabbage and roots.

6. I could not tell even approximately.

7. From various streams fed by springs and snows in the mountains.

8. I do not think it has injured the land here at least.

9. The party first appropriating the water has the preference for what his ditch will carry, if it needs that much.

10. In some places all appropriated under the foregoing rule.

11. None of account.

12. From forty-nine fiftieths to ninety-nine one-hundredths, although, as I stated in an answer to the seventh interrogatory of first series, about two-thirds or three-fourths of the lands are nearly worthless for pasturage or any other purpose.

13. My judgment is that if any person wishes to establish a homestead on pasturage lands they should be permitted to do so the same as on other lands, and the same quantity; for if engaged in stock-raising they would naturally want a house to live in and some other improvements for their own convenience, and would want them on land of their own.

14. I think that it would not be advisable to put the pasturage lands in market for private entry, for the reason that the stock-raising business is the principal industry in many parts of the country, as much of it is fit for no other purpose. It is now carried on to a great extent by men of small means, and the profits are divided among the many; the poor man would not be able to buy the land, whereas if the lands were subject to private entry they would be bought up by a few rich men, and stock-raising would then be in the hands of the few, and the poor man would be forced to sell his stock for whatever the land owner saw fit to pay him, and thus he would be compelled to seek some other employment to gain a living, and the pastoral portion of the country would, to a great extent, become depopulated; the land would necessarily have to be reduced very much in price to enable it to be sold, and would bring but a small revenue to the government in comparison to the injury it would entail on the small stock-raisers. The object is or should be to frame laws so as to be of the greatest benefit to the greatest number. Where a country is settled by people who are carrying on business in their own right the country is more prosperous and the people are more contented and happy than where they are dependent on employment that others may see fit to give them; and as a general rule, where a country is thickly settled and the property owned by the masses, there is a greater revenue to the government than where the same amount of property is owned by the few. I am no enemy to the rich man, but concede to him his just rights.

18. Diminished to a certain extent.

19. Do not fence their ranges; could not with safety.

20. I think not.

26. According to assessor's report, cattle, 36,103; sheep, 18,949; horses and mules, 5,812; but I think there are about 100,000 head of cattle in the county. The county is about 200 miles long and 60 miles wide, and contains about 12,000 square miles, less than one head of cattle to the square mile.

28. There is trouble in ascertaining corners. In many instances the original corners were of soft rock, which soon crumbled to dust; and where there were mounds and stakes, cattle have rubbed down the stakes and tramped down the earth mounds so that they are not visible, and most of the stakes are gone.

#### TIMBER.

1. None in this part of the State, but a little about 25 miles from here, near Silver City, Idaho.

2. None planted here.

3. I would sell timber lands to actual settlers only and in limited quantities. Say, for very best of heavy timber, such as redwood, 10 acres at \$10 per acre; good heavy timber of best quality, except redwood, 20 acres, at \$5 per acre; good timber, 40 acres, at \$2.50 per acre; poor timber, 160 acres, at \$1.25. I would think it best where there are mines and mining towns to collect stumpage, and have pay for all the timber felled whether wasted or used; and where there are large bodies of timber, and it is needed, have foresters appointed, and all timber cut under his instructions and superintendence. I think it would be a good plan to reserve one-half of the timber lands, where there are large bodies, for the future.

D. D. MUNGER.

*Testimony of W. S. Newby, farmer, Yamhill County, Oregon, on agriculture and timber.*

McMINNVILLE, OREG.

December 20, 1879.

DEAR SIR: In reply to your interrogatives submitted to me, I would state that my name is W. S. Newby; residence, McMinnville, Yamhill County, Oregon; occupation, farmer and grain merchant. I have resided in this county since the year 1844 (or thirty-five years).

I acquired title to 640 acres of government land in the year 1850 under the law known as the donation law of Congress in the year 1850. My knowledge of the practical workings of the public-land laws has been from personal experience and observation.

The time and expense ordinarily incurred in procuring a title to public land in uncontested cases would be from three and a half to six years, at a cost of from \$20 to \$200; this of course depends upon the kind of land located and also under what law it is

accordance with. As to contested land cases it would likely terminate as other legal cases; the time and expense necessary to adjust the matter would be uncertain. I don't just now call to mind an actual case of this kind containing anything important.

In regard to the defects in practical workings of the land laws, I think upon the whole, as far as the same has come to my knowledge, that they have been very wisely formed; and with a majority of the honest class of people are quite satisfactory; at least such has been the case throughout this section of country.

The character of the public lands in this county (generally speaking), the soil is a dark rich loam, calculated to produce crops for many years successively without manuring; at least such has been the case (or result) of many years of practical use of adjacent lands of a similar character throughout this county and in fact the Willamette Valley.

I presume it safe to say that two-thirds of the public land in this county are pastoral and timber lands; possibly more than one-third might be termed agricultural.

I think that the government can ascertain and fix the character of the several classes of public lands in this and adjacent counties by a general rule; this I think would be more satisfactory than otherwise.

The present system of land parceling surveys, in my opinion, is well adapted to the majority of lands for settlement, as under the various general land laws settlers can obtain, as a rule, all the lands of either class desired.

The climate in this county, and in fact throughout the entire Willamette Valley and coast range, is quite mild, the warmest temperature seldom exceeding  $100^{\circ}$  in the shade, and the coldest weather never being more than an average of  $6^{\circ}$  below zero. Fall-sown wheat does splendid, often yielding from 45 to 54 bushels per acre, and it is a rare thing that the freezing weather injures the wheat crop. The usual time of year the rainfall begins is from the 1st to the 10th of October, and is liable to continue at intervals until about the first of to the middle of March, after which time we often have nice growing showers during the months of April, May, and June.

It is a very rare thing to see the low lands covered with any depth of snow, and then not lasting more than from two to four days.

Irrigation is a thing hardly known, and never employed by farmers; consequently, we may say that all of our lands can be profitably cultivated without irrigation.

The highest hill-tops along the coast range have produced abundant crops whenever cultivated.

The proportion of lands adapted to pasturage only, I think might be placed at about one-third of all.

I should think the average amount of land required to raise one head of beef for market would be three acres; this section compares favorably with other sections in this respect.

I would think from three to four head of cattle sufficient to support the average family.

Yamhill County contains 285,641 acres of land, 6,503 head of cattle, 20,837 head of sheep, as per assessment of 1879. Cattle-raisers usually fence a portion of their ranges at least. Yes, cattle can be confined safely on their ranges during the winter months by fencing.

In grazing I think that four sheep are equal to one head of cattle. Sheep and cattle will not graze on the same land if left to choose their pasture. Horses will graze some with sheep. I think, as a general rule, the grass has diminished when it has been pastured by sheep.

The supply of stock water is good in most localities—better, I think, than found in a majority of the stock locations.

I don't think there would be any trouble in ascertaining the corners of the surveyed public lands in this county.

The amount or proportion of timbered land throughout this section I would estimate at about two-thirds the entire public lands of this and adjoining counties.

The timber in this county is principally fir, oak, ash, and alder, and as to quality will compare favorably with the timber in any country; in fact, it is acknowledged to be of superior quality whenever tested.

Usually when forests are felled there is a second growth of timber, which grows very rank, and therefore is quite frail when matured.

As to the origin of forest fires, it is hardly possible to give you a definite answer, as there are various ways understood from which they might originate.

Some years ago their destructiveness was much greater than of late years. I think as the lands are settled this difficulty will gradually grow less serious. I think these fires often occur from carelessness of travelers and hunters in leaving camp-fires to take care of themselves, &c.

As far as my knowledge goes, I don't think the depredations upon the timbered lands very serious, at least in this county; for of late years I am satisfied that persons are more conscientious about cutting timber on public lands for private purposes.

I think it would be advisable and advantageous, for obvious reasons that will occur

to you, to place the timbered lands within the jurisdiction of the United States district land offices; this surely would be more convenient to persons wishing to purchase and locate these lands.

We have no mining claims or mining interests in this section of country; consequently I am unable to give you any information in this direction.

Hoping that in answering the questions submitted to me, this brief reply will be satisfactory,

I am yours, truly,

W. S. NEWBY.

*Testimony of L. S. Burnham, near Salt Lake City, Utah, relative to agricultural lands and lode claims.*

SALT LAKE CITY, UTAH, December 14, 1879.

*To the Public Land Commission:*

1. L. S. Burnham, 10 miles north of Salt Lake City; farmer.
2. Twenty-five years.
5. Many fraudulent entries; vicious protests (frontier administration).
10. Only desert land entries (greatly altered); too quick; impossible.

#### AGRICULTURAL LANDS.

Never allow more than eighty acres of desert land filed on by one man and a fee of say \$25, on conditions of reclaiming and inhabiting the same within three years; prove the same and receive a patent fee, and we will have fifty times as much land reclaimed fifty times as many agricultural homes, and twenty times as many school-houses. By all means give a government commissioner or commissioners to make personal examination of all protests or disputes, ascertain the facts as by law, and correct any wrongs save a thousand poor farmers, and a hundred thousand lawsuits.

I have somewhat extended experience in this western world in farming, irrigation and mining, especially mining lodes, for twenty-five years in Utah; born in Vermont lived there to manhood; farmed fifteen years in Illinois; now sixty-three years of age; five sons around me, farmers.

#### MINING LODE CLAIMS.

21. Alter the laws; let all lode claims consist of not more than 1,500 feet length and not more than 1,000 feet in breadth; surface measure horizontal, end and side lines vertical, with square corners; possessory right ninety days to recording with district recorder (a county recorder); 120 days to survey and recording in district land office if there be one, and one year to government purchase, or forfeiture, subject to relocation by any other party or parties under a new name.

The above, as laws, would stop millions of loss in lawsuits, and stop a multitude of blackmailing, and open many valuable mines that are silent and shut down in quarrels. And give aforesaid commissioners jurisdiction over mineral as well as agricultural land disputes, with a salary, and never fees.

I could post you somewhat on ranching, farming, mining, timber, water, irrigation &c., but can't write as much as I can think. Congress need not bore artesian wells: the above proposed desert land laws will bore one thousand wells to Congress one.

Truly yours,

L. S. BURNHAM.

*Testimony of William E. Hall, miner, Big Cottonwood, Utah, relative to agriculture, timber and lode claims.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

1. William E. Hall; miner; Big Cottonwood, Utah.
2. Seven years.
3. Yes, mining lands.
4. None.
5. There has been considerable unnecessary expense in getting public-land titles, because of defective laws.
6. There are many defects; have not time to write them.
7. Mining.

8. Geographical division.

9. For mining, say, give each party 40 acres; it would give plenty of room for every purpose connected with mining.

#### AGRICULTURE.

1. Plenty of snow in winter.

#### TIMBER.

1. Not much; pine.

#### LODE CLAIMS.

1. Thirty-five years mining and mining superintendent.

2. There are many defects in the United States mining laws; have not time to answer them.

4. I understand it to be the outcropping of the vein. By no means, no; have known many instances of this kind.

5. Parties so located ought to have time to determine the course of their vein.

6. Yes, most decidedly; great injustice.

7. Yes; many cases of this kind have come under my notice.

8. Yes.

9. No.

10. Yes.

11. To the disadvantage.

12. Should not cloud A's title.

13. Yes; this is often the case.

14. Yes.

15. Yes; Big Cottonwood. Partly miners, the rest citizens.

16. Local records and customs generally are unsatisfactory.

17. Yes, by miners meeting.

18. Yes; none.

19. Yes.

20. Yes.

21. A man should follow his vein wherever it went on his side lines 40 acres.

22. No; yes; two years.

---

*Testimony of Joseph Hatch, Salt Lake City, Utah, relative to timber, timber laws, cutting of timber, destruction of timber, protection of timber, timber in the pasturage lands.*

Joseph Hatch, of Heber City, Utah, testified at Salt Lake City, September 17, 1879, as follows:

I am acquainted with the timber country of the Wasatch and Minto Ranges. As I understand the timber law, it does not allow parties to cut growing timber under 8 inches. My opinion is that parties fire the timber to kill it, so that they can get dead timber for nothing. I think the timber land ought to be protected in some way, and that the timber law might be better administered if it was in the hands of district land officers. The timber is being very rapidly destroyed by fire. The next two years will clear the timber in the pasturage lands, if fires are like they were last year. The most of these fires are purposely set, so as to obtain the timber without violating the law.

---

*Testimony of Mason M. Hill, Salt Lake City, Utah, relative to lode claims.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

*United States Public Land Commission:*

GENTLEMEN: Replying to your questions asked, I herewith write answers *seriatim*:

1. I have had experience in organizing mining districts, locating mines, superintending developments, tracing and experting, buying and selling, and the business sometimes attended with litigation, both for the companies for whom I acted and with myself personally. Places, California, Nevada, and Utah. From dates 1861 to 1864 in the former States, and since 1864 until now in Utah.

2. Seeming defects in the United States laws will be only briefly suggested in giving specific answers to succeeding inquiries.

3. No overlapping surface claim should in any instance be accepted by surveyor-

generals so long as miners' records are permitted as having even a color of validity for evidence of possessory title. Any conflict involving "fee" title either to surface ground or lode should be adjudicated by a court of competent jurisdiction before any survey of a claim is accepted, or, rather, patent issued.

4. The top or apex of a vein or lode is where it has been projected through the country rock by an acting subterranean agency or force. Surface slides may cover it afterwards or obscure it so the "apex of vein" may be several feet from the surface, but still the "apex" where found incased in defined wall rock, or between two formations defined as a contact vein.

The apex can be determined when found, but the course of the vein *carefully defined* means oftentimes expenditure of time and money. Its "angle or direction of dip" must be somewhat a matter of conjecture from any judgment based upon "early workings" of lode.

5. I do not think "discovery rights" are or can be protected from encroachments or litigation by any location now made, but I suggest further legislation should compel discoverer to definitely define his discovery or claim.

6. Some litigation and injustice have grown out of the impossibility to determine points above stated, but more on account of neglecting to determine them when it has been possible to do so.

7. I have known of two seams parallel, located by different parties, giving rise to contests and litigation.

8. I have learned in most instances afterwards deep mining developed a junction of the seams sometimes very low down in ledge.

9. The outcrops of lodes are often wider than the present legal width of claim whether located under United States or State laws.

10. The outcrops very often deviate from a straight line, and sometimes pass beyond surveyed side lines.

11. It may be used to advantage by discoverers of true lodes; but, better still, I suggest allow greater surface width in survey for patent. This will prevent this privilege of location to be used to his disadvantage.

12. B can, who has discovered nothing, cloud the title of A, and often extracts and carries away his ore before being traced out, and compels the discoverer often expensive litigation. The instances in Utah courts are too many to state or give particulars.

13. The first question in query 13 I answer yes. To second I answer, "Legal attacks or invasion of discovery rights are about equally divided in being directed to dip of lode passing beyond exterior lines below surface," and in commencing mining work on surface ground exterior to located or patented lines, and prosecuting work to strike discovered ledge anywhere in its course down but away from main work and developments by discoverers.

14. A provision by which locators can secure and quietly have what they discover they have a right to ask. The lode in its depths may be the most valuable or, indeed, all that is valuable in the discovery. Greater surface width at the option of the locator to prevent invasion of his discovery right should be given him legally, and if he fails to protect himself it will be his own fault. I disapprove any legislation that would stimulate mining work to secure valuable ore deposited in a lode at a low angle or dip in its course outside of the discovery rights to follow hanging and foot wall in the interests of the discoverer. The ledge is found in its depths by a surface discovery, and should not be parted in justice to the discoverer. Only another form of litigation would result by a mining provision contemplating its possibility, viz: the acquiring rights by doing mining work with the end in view of segregating a lode linearly where its dip takes it out of its exterior surface lines. The ore body found means all of it limited linearly only by end lines or stakes, and the United States limitation provisions in this respect is only a fair provision of law.

15. I answer, I have, both in Nevada and Utah, several of them. At Reese River, in Nevada and several districts in Utah, including the discovery and organization of Paragat district, in the extreme southern portion of the Territory, in the year 1863. The only officer generally was a recorder, and the only book a common blank book wherein to record claims.

16. The mode generally has been to fix boundary limits to a district by some prominent natural objects: mountain passes or streams, or all combined, name district, take up ledges in mountains by following float ore or discolored seams on mountain sides, or mineral stained outcrops of country rock. The direction of the lode has been considered a reserved right of the discoverer to determine by after mining work as well as the dip or direction of lode in going down. His location notice has been generally posted on ledge with supposed direction of vein according to compass points and at same time left with district recorder, stating in what mountain or near what natural objects outcrop or notice may be found. In a majority of claims this preliminary work has been done so imperfectly, these records would aid but little even in finding the lodes or veins they contain or describe. The effect of this imperfect record

location has been, however, to enable the real discoverer to hold his claims, oftentimes however with great difficulty.

17. I can only suggest an amendment to all district records in the past by outlawing them in their present form. Some limitation act compelling a legal form of notice which would take all the valuable locations out of the old district record books, compelling defined lines and monuments or stakes showing claim boundaries, would prevent innocent purchasers from losing often in making investments hereafter.

18. Answering this question, I have; and only suggest as the most perfect security against frauds here to outlaw the record made in any mining locality, both those already made and those that may be hereafter made. Allow the miner, say, one year for such record to be thereafter verified and filed in a mineral land and lode record to be kept by register of the United States land office.

19. The land offices are too few and oftentimes too distant for immediate record of a mining discovery. A quiet record, including district record with a mineral record, to be kept only at the United States land office, with legal forms and notices of locations and filings, are necessary. All mining locations to be finally entered at least within a year at the register's office, and claims subject to relocation by failure to do so.

20. Mining controversies should not be left to United States land offices when title or legal acts or facts to be settled by a jury arise.

21. I approve the legal provisions of the United States mining laws so far made. Amendments should be made including following suggestions: Work done on any claim sufficient to get a patent and buy surface rights ought to release, legally, owners from a yearly work assessment or expenditure. An additional time to secure patent thereafter should be allowed, but time of possessory title limited for holding claim, unless a certified amount, say \$5,000, has been so expended in development and necessary mining improvements without disturbing discovery title connected with a true following of vein in its dip. I would give additional surface rights, at the option of discoverer, with right to lodes undiscovered therein, confining him linearly to 1,500 feet, as now provided.

22. A possessory title ought to be limited, but the extraordinary expenditure necessary to get a patent for mines of mineral lands should be so changed as to enable a poor miner to get his patent. In some instances it now costs from \$300 to \$400 to get a patent for five or six acres of land on a mountain side. Locators, if compelled to patent claims, should be able to do so for a reasonable sum. United States surveyors are employed by the miner to do his work dictated and controlled entirely by United States officers of the locality. Charging the miner for his time, those who pay not for it have the power to make a little work very expensive. It is done in almost every instance when application is made for a patent.

I will extend statements and suggestions in answer to queries Nos. 21 and 22 when answering questions under head of placer mines in a letter which I will send you hereafter, the same now having been omitted for want of time.

Very respectfully,

MASON M. HILL,

SALT LAKE CITY, UTAH.

---

*Testimony of Charles W. Stayner, attorney-at-law, Salt Lake City, Utah relative to homestead and pre-emption laws, canals for irrigating, settlers' claims, desert land act, timber and mineral lands. Land laws—amendments suggested.*

SALT LAKE CITY, UTAH.

GENTLEMEN: As an attorney practicing in Utah, and having some experience in land cases, as well as some knowledge of the difficulties under which the settlers of this Territory have to labor, both as regards land and timber, I herewith present for your consideration a few suggestions which are the result not only of my own observation, but of others who have constituted me their representative in these matters.

First. In regard to the homestead and pre-emption laws. I would respectfully call your attention to a memorial of the governor and legislative assembly of the Territory of Utah, approved February 22, 1878, and to be found on pages 168 and 169 of the printed laws, memorials, and resolutions passed at the last session of the assembly. This memorial shows that settlers upon public lands in this Territory are "frequently distressed by the lack of water for domestic purposes, or the brackish and unwholesome nature of the water there obtained from wells, until by the construction of canals for irrigation water is brought through such land suitable for general use;" and the document proceeds to ask for legislation that shall extend to *bona fide* builders of canals and ditches the benefit of existing laws in such a manner that so much means or labor expended upon such canals may be counted equivalent to a given residence on the land under the homestead act; proper and adequate proof to be given before the local land officers. I would urge your consideration of this subject as set forth in said memo-

rial, and also suggest that the legislation be extended to include settlers under the pre-emption act, and to provide that a portion of the money and labor expended on said ditches and canals be allowed to apply on the purchase-money for said land. I would further represent that, in numerous instances, settlers being compelled to make actual residence on their claims for *at least six months*, are put to the expense of building a dwelling of some kind, and of moving their families on to the tract, and during said period and until the land is paid for are limited for daily use to the unwholesome water that prevails on land impregnated with alkali; that some do, when practicable, haul water in barrels from the settlements or from the nearest creeks; that these settlers are subjected to this inconvenience and expense without any good resulting either to the settler or to the public, as in most cases, if not in all, the settler will, as soon as the six months expire, if possible, make his cash entry and immediately remove to a more healthy and comfortable neighborhood. He has in the meantime expended money and risked health, and in some cases life itself, to fill the law, and yet made no permanent improvement, except the cultivation of part of the land, which could have been done with greater ease and to a wider extent if the building and moving had not been required.

I think that the making of irrigating ditches and canals, the building of fences, and a general improvement of the tract by cultivation, would result in far greater good to the settler and to the public at large than the building of a shanty which is removed as soon as the law will permit that made it a necessity.

Furthermore, families are in many instances removed miles away from the settlements where they have congregated to protect themselves from Indians, and are compelled to live out on an open prairie where they are subjected to continual dread, if not actual danger, and are deprived of medical aid in cases of sickness, which is at times quite prevalent here as elsewhere, especially among the children. The younger members of the family are also debarred from the advantages of school education, and thus lose months, and perhaps two or three years' schooling, owing to the poverty of the settler, who frequently cannot raise means to pay up for his land at the end of six months, and must remain a resident upon it till he can and does do so. His opportunities for raising the purchase money are also curtailed, through his being compelled to remain on the tract, as he is debarred from working for money, which he might do were he permitted to retain his residence in the settlement. Thus his payment is retarded sometimes till the expiration of the allotted period of thirty months, and the government is a loser as well as the settler. The land is filed on by some other claimant, and the original settler is regarded as having abandoned and forfeited his pre-emption claim, notwithstanding his residence and his improvements, which may be very extensive and valuable.

Secondly. In relation to the desert act. This law evidently should be modified so as to provide that when parties have expended a certain amount of means or labor in turning streams of water from their natural channels, in order to reclaim a tract, and have not at the expiration of the three years allotted thoroughly accomplished the reclamation of the land as required, they may, on proper showing and proof before the local officers, obtain an extension of time to complete their work; and, furthermore, some portion of their expenditure should in my opinion be allowed on the price of the land unless the general price under this act be reduced, which would be preferable and perhaps more just to rich and poor alike. In that case the price ought not to exceed 25 cents at time of entry, and 25 cents additional at time of final proof, for in nearly all cases of desert land in this Territory the land is very inferior, and the expense needed to reclaim it by irrigation is exceedingly heavy.

Thirdly. I would call your honors' attention to the anomalous condition of this Territory regarding timber. Differently situated in many respects from other parts of the country, the agricultural classes, of which the inhabitants of the Territory principally consist, are suffering under the exacting provisions of laws made for other regions and for different objects from those which prevail here. On observing the visible mountain-sides, it is palpably manifest that no timber grows upon them, but in order to reach the timber or even fire-wood the settlers must go far into the recesses of the cañons, and the spots where timber is usually found are frequently, if not always, outside the limits of mining districts and of lands classed by the government as mineral. Consequently the cutting of timber and wood as generally carried on is not authorized by but is in direct violation of the law authorizing residents "to fell and remove timber for building, agricultural, mining, and other domestic purposes," approved June 3, 1878, which limits such privileges to *mineral lands only*; and the settler so using the timber is liable to criminal prosecution under section 2461, United States Revised Statutes, which was evidently passed to protect timber for the use of the Navy, and not in any manner to affect people in this inland Territory.

These two laws should be so amended as to permit timber to be cut in our cañons on lands *other than mineral*. I would also represent that a provision forbidding the cutting of timber measuring less than eight inches in diameter, and contained in the rules and regulations issued by the honorable Commissioner of the General Land Office,

is too general in its character, in that it may be construed to restrict the cutting of scrub brush which is only fit for fire-wood, and which never measures more than eight inches in diameter. This brush constitutes the principal fuel in some parts of the Territory, its removal is no injury to the timber required for other purposes, it would never grow into timber of any useful size, and yet the settler is unwittingly liable to harassing suits for an infraction of the United States law above referred to, or a prospective tax upon every load of such wood hauled by him, and which has cost him in labor on the cañon roads, and in time spent in hauling it, all that the wood when hauled could possibly be worth.

Your honors will perceive that the above suggestions are offered chiefly in the interest of the farmer and the working man, in whose behalf I respectfully solicit your consideration and influence.

I am, gentlemen, very respectfully, yours,

CHAS. W. STAYNER.

*Testimony of D. P. Ballard, lawyer, Yakima City, Wash., relative to agriculture, timber, and lode claims.*

The questions to which the following answers are given will be found by unfolding page opposite page 1:

YAKIMA CITY, WASH., October 3, 1879.

To the Public Land Commission, Washington, D. C.:

GENTLEMEN: Agreeably to your request, I beg leave to submit the following in answer to your questions contained in circular, and herewith forward as requested.

1. D. P. Ballard, lawyer, Yakima City, Wash.
2. Two years.
3. Yes. Soldiers' homestead and pre-emption.
4. By transacting business for others.
5. Uncontested—average cost for homestead, \$23.50; time, ten days. Contested—cost, \$150; time, forty-five days.
6. Yes. There are too few land offices, and permitting parties to "prove up" or "make filings" before clerks, &c., opens wide the door of fraud and favoritism. These "clerks, &c.," having plats forwarded to them from land office 150 to 250 miles away, "cover up" special claims to accommodate pets. The homestead and pre-emption laws being made for the poor, no fees should be charged for "entries." Also require contestants to proceed in local courts.
7. Between Columbia River and Cascade Mountains—low mountain or hill covered with bunch grass and sage brush, and valleys varying from 1 to 30 miles wide and 10 to 100 long. All pastoral and agricultural well up into the Cascades to timber line. Small skirts of timber along streams.
8. No general rule or geographical division will do, unless we call lands agricultural, pastoral, and timber, the word "timber" not to include lands covered with brush, balm, or cottonwood, but such to be classed as pastoral in this entire Territory east of Cascade Mountains.
9. Have been county surveyor. Do not think I could now recommend any change.
10. Let each homesteader and pre-emptor, in prairie countries like this, with all the timber in mountains, and where we go from 5 to 30 miles for fuel, &c., be allowed to pre-empt 200 acres—160 prairie and 40 of timber—whether adjoining his home or not. Give each soldier of 1861-'65 a land warrant for 160 acres. Let sawmill men buy in tracts of 640 acres, and when any three county officers certify that that 640 is "skinned," sell another section. Charge settlers—that is, agriculturists—\$1.25 and sawmill men \$2.50 per acre.

#### AGRICULTURE.

1. Short winter, long summer. Rain in early spring and late fall. Season from March 15 to December 25. Snow one-half foot to four feet deep, according to locality. Plenty of water for irrigating.
2. Spring and fall—two-thirds in spring. Yes.
3. One-half of all tillable land, being about one-third the whole.
4. One-third the whole.
5. Wheat, oats, rye, barley, corn, buckwheat, apples, peaches, pears. All small fruits and vegetables.
6. Do not know.
7. From mountain snow which melts in May, June, &c.
8. By irrigation the fertility of soil is increased, as is evident from the fact that the tenth and twelfth wheat crop (as other grain) is better than the first, and no manure used. Three thousand feet above sea.

9. One-tenth to one-fourth exhausted. After two or three years the land becomes "full" of water and requires little or none. Both. Custom and common law with act of July, 1866.

10. So to speak, none "taken up." Riparian owners, by custom, facilitate its use.

11. None, worthy of note.

12. One-third.

13. No. But if, then 640 acres.

14. No, by no means. We have 300,000 cattle and horses now living on these lands. But if yes, then 640 acres to each man (on account of rocky wastes) and at 25 cents per acre.

15. One acre (grass) favorably.

16. This question is not easily answered, for it is too general.

17. Not over two or three.

18. No perceptible change.

19. No. No.

20. No. It would d—n us.

21. Plenty.

22. Do not know.

23. Diminished.

24. Yes, and no—owing to locality.

25. None so far.

26. Sheep, 100,000; cattle, 300,000.

27. None.

28. Yes. Corner stakes rotted and gone; mounds poorly made.

#### TIMBER.

1. A strip 20 to 45 miles wide extending from south to north line of Territory. Pine fir, cedar, tamarac, and very little oak. All excellent but oak.

2. Cottonwood, Lombardy poplar, and walnut in valleys. First two. Time, eight to twelve years.

3. By sale. See answer to question 10.

4. Classify both in kinds and size of tracts.

5. Yes; scrubby in part. Twenty years.

6. Are result of camping fires. Small in extent. Make it criminal.

7. Railroad cut extensively, and should pay. Miners, builders, &c., should have it free, as they waste none. Make it felony for corporations to depredate, except for mining, &c.

8. Lent *ad libitum*. First who gets it.

9. No; unless land offices be increased in number. Then, yes.

#### LODE CLAIMS.

1. South Western Missouri. Lead and zinc.

2. Not posted.

3. Can give none.

4. No; to last part.

5. I think so.

6. Cannot say.

7. Have heard so.

8. Decline to further answer respecting mining.

D. P. BALLARD.

*Testimony of James T. Berry, surveyor, Chehalis, Wash., relative to agriculture, timber, and placer claims.*

The questions to which the following answers are given will be found by unfolding page —:

1. James T. Berry, surveyor; Chehalis, Wash.

2. Eight years.

3. I have homestead; 160 acres.

5. I obtained my patent within forty days after making final proof, uncontested.

6. I think it a needless expense to have to travel to register's office to file and make proof.

7. We have agricultural, pastoral, and mineral lands. The river and creek bottoms are good, productive lands. The Burnt Hills pastoral, generally coal deposits.

8. General rule. Not possible by geographical lines.

9. I think the level and bottom lands unsurveyed should be subdivided in sections to suit shape of lands, and the mountainous regions left to be selected as wanted by mining parties.

#### AGRICULTURE.

1. The climate is even and beautiful here. Rainfall great. No irrigation necessary.
2. From October to June. There is always sufficient water-supply when most needed for growing vegetation.
3. All.
8. At from 1,200 to 1,600 feet altitude.
13. I think, one section.
14. Only by actual settlement.
18. Increased.
20. I think so.
21. Plentiful.
24. No.
25. Cattle will not remain on sheeps' pasture.
28. In some few cases the corners are now hard to determine, especially where fires have occurred.

#### TIMBER.

1. The land has been once all timber.
5. I know of several fir forests, with no living cedar now, that once had fine cedar, which had been destroyed by fire.
6. The natives set out the fires, which are very destructive to both soil and timber.
7. The depredations are very limited in this county.
9. Perhaps so.

#### PLACER CLAIMS.

1. Coal and iron are very extensive; I believe coal underlies nearly half the surface of our county, 1,000 miles square.

#### *Testimony of A. K. Bush, Riverside, Wash., postmaster. (Abstract.)*

Suggests the following defect in the present laws: "Under the ruling that those who notify on homestead claims and fail to perfect title may notify on another claim, it is a common practice to take off marketable timber, abandon, and relocate."

The soil and climate of at least the larger portion of the Territory favors the growth of cereals, except corn, for which the nights (on the coast range especially) are too cool. The yield of grass is very great on both hill and valley lands. Apples, plums, pears, cherries, and most small fruits yield largely and are of fine quality. Peaches, grapes, &c., on the portions bordering on the ocean cannot be grown to any advantage, for want of sufficient warm weather.

There are many tracts of excellent timber available for manufacture of lumber, for ship-building, farm-building, &c. This land, when cleared, will produce a large growth of grass, and that portion which is not too hilly or rolling for cultivation will grow grain, vegetables, &c. All kinds of hardy vegetables yield largely, and are of fine quality.

There are indications of coal deposits in this county, in one or two places particularly. The deposits are believed to be large and easy of access.

Rainfall 49 inches and upwards; rainy seasons generally commence November 1 to December 1, lasting until April or May; February often dry and pleasant; snow in western part of Territory almost unknown; country well watered by streams, large and small, springs, &c.

Tide lands on bays and rivers (unless diked) and hills too steep for cultivation.

Would dispose of timber lands by homestead to those wanting homes, by sale to mill-owners in tracts from 160 to 230 acres, if within available distance of their mills, at from \$2.50 to \$5 per acre, according to location, timber, &c. I would suggest that 640 acres be the very extreme sold to any one firm, unless in some country good for nothing but timber, and that we do not have in Washington, so far as my knowledge extends. If not limited, many will purchase large tracts, even where no mills are built, hold it for years, and thus prevent others from getting it who would build mills and manufacture it into lumber, &c.; also retarding settlement of country. There is much timber stolen by mill-owners and others furnishing logs to them. Would suggest that men be appointed and means be furnished to enforce laws already enacted. Laws not enforced are worse than no laws at all.

I do not think it would make much difference where the authority was vested, if all departments were alike honest and men who would act without fear or favor were appointed in each different section of country where such depredations were likely to occur, to look out for such depredations and report to the proper authority, &c.

Respectfully,

A. K. BUSH.

*Testimony of Hiram Dustin, Golden Dale, Klikitat County, Washington, relative to agriculture, timber, and lode claims.*

The questions to which the following answers are given will be found by unfolding page —:

*To the Land Commission:*

**MESSRS:** Having received a pamphlet containing interrogatories, I proceed to answer such as have come within my knowledge and observation, and also to offer a few suggestions in relation to your business as commissioners.

1. I am a resident of the town of Golden Dale, Klikitat County, Washington Territory, and have been for about two years.

2. I have not acquired or sought to acquire title to any of the public lands in this Territory, but located a homestead in Oregon some nine years ago.

3. Being in the practice of the law in this county, I have had occasion to examine the present land laws, and believe that, as a general thing, they are efficient and produce the intended results, with the exception perhaps of the act in relation to soldiers' additional homesteads, which I think is an instrument placed in the hands of monopolies—provided they see fit to avail themselves of it—that will do great mischief because of the vast quantity of soldiers' additional homesteads now for sale. I think the intention of Congress was to benefit the soldier, and that no one person should have a right to buy them up and locate more than one tract of land; but as it now stands a man can locate as much land as he can buy soldiers' tracts to cover.

The physical character of the country in this county is rough and mountainous. there is not over one-third of this county that is adapted to farming, a greater portion of it being timber and pastoral lands.

This is a temperate climate and very dry. The snow falls on an average about one foot deep. Some winters, however, there is scarcely any snow at all. The rain falls most late in the fall and during the winter. There is but very little irrigation of crops in this county; but in Yakima County, joining us on the northeast, they irrigate all crops; in fact, there is no certainty without it. My observation of irrigation has led me to believe that it is an injury to the soil in certain localities, while crops seem to grow rank by its use. I think the land will sooner wear out. In Yakima Valley there is the finest chance for irrigation; the land is level, and the streams rise high up in the mountains which surround it and spread promiscuously over it. The farmers have brought two very nice ditches from the mountain streams, which afford abundant irrigation.

With regard to pasturage land, I would suggest that it would be a good idea for Congress to pass an act allowing persons to locate pasture claims either as a homestead or allow them to purchase a certain quantity at, say, \$1 per acre, but not allowing any one person to locate over 200 acres. This, I think, would keep on an average about one hundred head of beef. Of course some parts of the country would do, I think, still better. There is plenty of beef cattle in this county, but as to the amount to the square mile I am not able to say. There are also large herds of sheep in this county, which bring more money into the county than from all other sources combined; but still they are not a success, as they eat out the range and destroy it. One sheep, in my opinion, is more destructive on grass than a full-grown cow, and the growth of grass is invariably diminished wherever sheep are pastured. I shall answer a few more questions with regard to the timber.

I cannot say how much timber there is in the county, but will say that there is an abundance of it, and mostly pine, which makes the finest finishing lumber we have in the market; I do not think it is excelled on this coast. There is, however, sections of land without any timber, and upon a number of such persons have located timber claims, under the timber-culture act, but as yet I fail to see the timber growing. In fact, I do not think there is twenty acres of timber planted in the valley. The people generally make raids upon the government timber lands. We have some six or seven sawmills in operation in this county, all of them cutting timber from government land. What ought to be done under the circumstances is a little hard to determine, yet I shall suggest a remedy. Let Congress pass an act allowing persons to cut timber on the government land by paying a certain revenue, and have some one appointed in each county to look after it and collect it. Something of this nature must be done or else

the laws must be put in execution, because in a few years thousands of lumber will be shipped away from this county to supply other parts of the Territory.

It is argued by some that it is not to the interest of the farmer that the mill men or the wood men should pay stumpage, for the reason that they would be the losers—being the consumers would have to pay the bill. I ask, would it not be far better for to pay a moderate revenue and thereby protect our timber and prevent its being destroyed, than to get our wood and lumber a few cents on the thousand or cord for a few years and then have none in the county at any price?

I do not wish to bring any one into trouble in expressing my views, but there is no question but what there should be some steps taken to arrest the wholesale destruction and robbing of the timber of the government. Either make them pay stumpage or compel them to purchase it. The worst of it is transient mills or portable mills can be built almost anywhere in the mountains, and when they have culled out the very finest of the timber, they simply move to another and better place. By this means the finest and best of the timber is being used up. Of course in time there will be a second growth, but its growth is very slow, perhaps twenty years before it would be of any consequence for poles or fire-wood.

As for lode claims I have had no experience whatever. There is, however, I learn from prospectors, good ledges or lodes not yet developed in this country, which will be a source of great wealth to the country at no far distant day, and there is no doubt in my mind but what Washington Territory will in a few years rank among the first agricultural and mineral States in the Union.

In conclusion, I would say, gentlemen, I hope you will excuse me for this very brief epistle and indefinite description of our country, but as I am not a traveler my knowledge of those things to which your attention as commissioners is called to is very limited, but this pamphlet was sent to me by the land agent of Vancouver, W. H. Smallwood, and I complied with his request to the best of my ability.

Yours, &c.,

HIRAM DUSTIN, *Attorney-at-Law.*

GOLDEN DALE, WASH.

*Testimony of Edward W. Smith, Evanston, Wyo., relative to the public lands, stock, water rights, surveys, cattle and sheep ranges, the sheep and cattle men, pastoral, homestead, timber lands, land surveys, arid and humid regions.*

EVANSTON, November 4, 1879.

EDWARD W. SMITH, of the firm of Beckwith, Gwynn & Co., bankers, merchants, and cattle dealers of long standing at Evanston, testified as follows:

I know the land in this district well. It consists mostly of grazing lands, and there is a little timber, with some precious metal. There is also deposits of coal in the district. There is no rainfall, and but little snow. There is so little agriculture in the district that it is hardly worth while to take it into account; it is all done by irrigation. The timber on the high mountains is spruce, shaking aspen, and cottonwood. On the grazing land bunch-grass predominates, intermingled with a little sweet swamp-grass. The rains decrease under grazing, and it takes about five acres to support one beef. I call this district a grazing district. I should say there were 100,000 head of cattle and the same number of sheep in the district. Calves are worth about \$5; yearlings \$10, and two-year-olds about \$15. Beef cattle are worth \$20 apiece, or two and one-half cents per pound gross weight. Sheep are worth \$1.50 to \$2.50 common for mutton, and 20 to 28 cents at the railroad. From 5 to 8 pounds of fleece can be cut from each sheep annually. Our cattle are mixed and graded; the breed is steadily improving, because of the liberal introduction of blooded bulls.

In the southern part of the district the water-rights have mostly been taken up for cattle and sheep. In that country there is a rule established by custom that the first appropriation of the water holds and controls it.

The district has not been wholly surveyed; the survey should be extended over the public lands in this district.

Cattle and sheep ranges are held by suffrage and custom. There is now a law of the territory which prevents trespassing upon occupied ranges near settlements, but away from the settlements the shot-gun is the only law, and the sheep and cattle men are engaged in a constant warfare. The sheep men are generally the aggressors. Their sheep destroy the grasses, and the cattle will not again graze on the land. If the stock owners could obtain absolute control of their ranges under United States laws, the value of the herds, both cattle and sheep, would be materially increased, both as regards beef and mutton and the wool, and peace and quiet would supersede the present turmoil.

The lands in this district are all arid, and there is no water for irrigation. The land should be surveyed and sold, in quantities to suit the purchaser at, say, 10 cents per

acre ; or I would lease or let them, referring all questions as to their occupancy to the district land officers. I think 100 head of cattle, and their increase, would sustain a family. Twenty-five or thirty acres of these lands will sustain a beef, so each settler should have a pastoral homestead of about 3,000 acres, and use of the land by his cattle should be considered occupancy. I think, in the present, herds of cattle and sheep consists the mineral wealth of this section, and whatever laws are passed that interest should be first considered and protected. This question of grazing titles should be settled at once. Possession of distinct and well-defined ranges will result in contentment and permanency. We have to have summer and winter ranges and put up hay for cattle.

The timber lands should be surveyed and sold in unlimited quantities. They are annually ravaged by fires, which destroy ten times what the people use. The entire subject of timber lands, as well as other lands, should be turned over to the United States district land officers. I would grade the price per acre both as to quantity and quality. Private ownership best protects property in this country.

I am acquainted with the present system of land surveys, and think it should be improved and retained. Stakes at corners should be more permanently established.

We need population, and the pastoral homestead will aid us to acquire it. We do business with most all the people in this district, and I know that they want these land matters settled at once.

This arid region never can have the same condition as the humid regions, and people must live in communities for school and other purposes.

## APPENDIX B.

## OPEN LETTER OF R. W. RAYMOND RELATIVE TO MINERAL LANDS.

[Published in the Engineering and Mining Journal serially, from November 22 to December 20, 1879.]

**GENTLEMEN:** I have the honor to acknowledge the receipt of your circular containing a list of questions with reference to agriculture, timber, and lode and placer mining claims: to such of which as may be within the range of my personal information answers are desired. I am in receipt also of your complimentary special invitation to state any general views upon the subject of the mining law, with which my professional experience and my former official position as United States Commissioner of Mining Statistics have made me somewhat familiar. Regretting that the pressure of business prevents me from preparing in response to such a call a full discussion of the problems involved in your inquiry, I feel, nevertheless, that, as a citizen deeply interested in the success of your labors, I am bound to do what I can in furtherance of them, and I beg leave, therefore, to submit the following statements and suggestions with reference to a part of the subjects now claiming your attention.

The principle of the right of the sovereign to the ownership or control of any of the minerals in the earth, apart from proprietorship of the land itself, is not recognized by our laws. The government, like any private proprietor, possesses the surface of its lands, together with all that lies beneath them, to the center of the globe. There is no distinction in this respect between the base and the precious metals, or between the Atlantic and the Pacific slopes, or between the areas acquired by the United States from individual States and those obtained by treaties with foreign nations or Indian tribes. So far as I am aware, the government owns the minerals when it owns the land, and not otherwise.

The mineral right, however, although it accompanies the surface ownership, is separable by the act of the owner. A farmer in New Jersey may lease or sell the right to mine and carry away all the iron ore in his farm, with the privileges of entry and use of the surface necessary to mining operations, retaining his title in all other respects unimpaired; or he may thus dispose of the right to a single bed or vein of ore, retaining all others. A farmer in Pennsylvania may in like manner lease or sell all his "coal rights," or the right to one or more specified seams of coal, reserving to himself, undiminished, whatever is not thus transferred. A party owning two adjacent farms may grant the mineral right to a given deposit of coal, ore, or other mineral upon one of them, with the right to follow and mine in the other that deposit only. All these and many varieties of grants actually occur in our Eastern States; and the rights thus conferred, as defined by the agreements creating them, are independent of surface ownership, although in their origin they rest upon the principle that the owner of the surface owns also the minerals beneath it.

The government occupies precisely this position towards the public domain. It can do what it likes with its own. There is no "miners' right," created by the discovery of valuable mineral in any part of that domain, except what the government chooses to create by its own voluntary acts. By such acts it is bound, as an individual would be, neither more nor less. It is as free as any individual would be to dispose, as it may see fit, of any rights not already conveyed away; to change its policy at any time; to lease or sell on new conditions, or to decline to lease or sell at all. This elementary statement seems to be required to correct a popular impression that the principles of the law of mines are different in different parts of our country, and that there is some mysterious obstacle in this difference to the introduction of a uniform system. The fact is, that the owner of a gold mine in Georgia might, if he chose, sell his mine on the terms prescribed by the government to purchasers of gold mines in Montana; and the government might, if it chose, by a change in the statute, alter its terms in Montana to conform to the present usual practice in Georgia.

The course of Federal legislation in this respect has been dictated by policy. Its object has been to encourage the development of the mineral resources of the public lands, and to transfer the ownership of both land and mineral rights to individual citizens. That this course is wisest in itself, and best adapted to the spirit of our institutions, scarcely admits of question. The policy of administering the public lands as a means of producing revenue, through mines, timber, agriculture, or rents, is one which a highly centralized or despotic government may perhaps pursue; but certainly, it is not suited to Democratic or representative government; and even in monarchical states, it has not proved advantageous, as may be inferred from the general tendency

in all enlightened nations at the present day, toward the transfer of governmental enterprises to private hands. It may be questioned, perhaps, whether a system by which the government, as in Spain, Portugal, and Mexico, retains the ownership of mines and leases them upon conditions involving their continuous working, is not calculated to secure a more active and steady mining industry than a system which, conferring individual ownership, permits mines to lie idle at the will of their owners. But I think no one can fail to perceive, upon thorough consideration, that the advantages of the Spanish system are delusive, and that its disadvantages, in the expense of administration and the inducements which it offers to the "robbing" of mines, are greater than its advantages, even if these were real. The tenant of a government mine will work it if it be profitable, of course. He would do the same, if he owned it. When it ceases to be profitable, he may continue operations for a while, rather than lose his lease. But there is no economic gain to the State in forcing its citizens to unremunerative labor. On the contrary, if a mine does not pay, it is best that it should be closed, while labor turns to more productive enterprise; and if a mine is to be closed it is far better that this should be done by an owner than by a tenant, for the owner may hope to resume operations under more favorable circumstances, while it is the interest of the tenant, whose abandonment of the property is final, to rob it of all accessible value and leave it in ruins. As for the revenue to be derived from renting mines, two things may be confidently asserted: First, if it were wise to burden the industry of mining with a tax not laid upon other forms of production, this could be done more effectively, conveniently, and equitably by a bullion tax; and secondly, it is not wise to do anything of the kind. I am aware that a dozen years ago, while the bullion tax was collected by our government, I favored in my report to the Secretary of the Treasury its continuance in reduced measure, and its devotion to special purposes for the benefit of the mining industries. I will not pause here to explain in what particulars the circumstances and in what particulars my views have changed. It is quite sufficient at present to say that the obvious policy of the government is to treat mining like any other industry, and to administer the mineral lands, like the agricultural lands, with as little machinery and as little interference with private enterprise as possible.

We come, then, to this proposition—the United States is the holder, as the trustee of the people, of a vast area of mineral land. On the whole, it is best to sell this land as fast as possible, not looking for large revenue from its sale, but rather transferring it to private owners at prices that will repay the cost of the surveys and other necessary proceedings, and under conditions that will favor the exploration of its resources. To encourage mining, or at all events to lay no unnecessary burdens upon it, and to get rid of the unproductive property in mineral lands which cannot under our system be made productive by the government—these are the objects to be attained by Federal legislation.

In selling the mineral lands should the government make any distinctions as to price? It would have a perfect right to do so; and it seems at first glance a wrong to the people that public property worth many millions of dollars should be given away to those who have no other claim than that of discovery. This point deserves careful consideration. There are three ways in which the government might derive pecuniary benefit from the developed value of the mines on the public domain. It might provide for an estimate of value by its own officers, and a price based on such an estimate. It might sell the mining locations at public auction, thus leaving the estimate of value to competing purchasers. Or, it might reserve a certain percentage of the gross or the net product of a mine—an unassessable interest in the property—which in case of a large and profitable development, would amount to a considerable sum. These three alternatives cover substantially all that could be done in this direction, apart from the actual retention of ownership by the government, and the collection of mine-rents.

As to the first of these, it is evident that in most cases no government officer could possibly make a just estimate of the value of a mine, before it had been worked; and no intending purchaser would spend money in developing it, without knowing at what price he could buy it; nor would it be for the interest of any intending purchaser to develop the real value of the property and thereby enhance its price.

The sale of locations at auction is open to similar objections. Nobody will explore and develop a piece of mining ground, with the knowledge that every proof of value which he may expose will make its acquisition more costly and more doubtful. But if such sales are to be held without previous exploration of the claims, then the chances are that the prices to be obtained by this method will not exceed the ordinary rates sufficiently to pay for the extra trouble and cost of administration.

The third alternative—the reservation of a proportion of the proceeds of a mine—would prove in practice, I think, difficult, odious, and unremunerative. It would be really a special tax. If levied upon gross production, it would bear severely on struggling enterprises. If levied upon profits, it would involve an inquisition into private business, a premium on deceit and concealment, and a vast amount of official labor for

comparatively small return. It would be like the revenue tax on spirits in difficulty of enforcement, but not in resulting revenue.

We may conclude, then, that the true policy of the government is to sell the mineral lands outright at uniform prices and with as little trouble and cost to itself and the purchaser as possible, seeking its profit, not in the direct proceeds of sale, but in the rapid development of natural resources and the establishment of prosperous communities.

It remains to be considered whether the present system of Federal mining law, as construed by the courts and administered by the General Land Office, effectively executes this policy; whether it needs reform; and, if so, whether that reform should be of the nature of moderate amendment or radical change. In the discussion of these questions, I shall strive rather to present an impartial statement of both sides than to advocate a definite scheme. No scheme suggested by individual study or experience can claim to be the best under the circumstances; because it is of the very essence of the problem that the system adopted by the government shall be acceptable to the mining communities. The present arrangement, whatever may be its defects, has the positive recommendation that it will work, is working; that it is a growth, and, like all growths, possesses vitality, which mere symmetry without vitality cannot replace; that its evils are known, while those of a new system are unknown. Moreover, it is of the utmost importance that any proposed reform shall be practicable and acceptable, because its failure to be adopted and successfully executed would indefinitely delay, and perhaps defeat, all reform in this department.

The declaration that the Government of the United States "owns the minerals when it owns the land, and not otherwise," might be deemed inexact as to Mexican land grants within our borders not yet confirmed by United States patent. Such grants, if they did not originally convey to the grantee the mining right, reserved that right to the sovereign; and upon the transfer of sovereignty to the United States this reserved ownership of the metals passed to our government, which thus became, in these instances, proprietor of the metals in the land otherwise owned by private parties. But the same leading cases in which this rule was laid down (chiefly the so-called *Mariposa* cases) contain the decision that a patent in confirmation of a Mexican grant is not restricted to the interest transferred by Mexico to its grantee, although such Mexican grant did not convey the precious metals. The practical application of this principle annuls the effect of the preceding one, and justifies the general statement that the right to metals in the soil, as a royal prerogative, is not incident to the sovereignty of the United States or of any single State.

The present system of Federal legislation originated in the tacit recognition of miners' customs, and has been gradually developed with perpetual, perhaps excessive, regard to those customs. Its general outlines are so generally known that I shall not burden this letter with a description of them. Still less can I attempt to discuss in detail its doubtful or ambiguous features, although some of these may receive attention in passing. I purpose rather on this occasion to consider directly the evils which seem to attend the operation of our present system, and the possible remedies for such evils.

Not all the complaints so loudly made deserve the attention or fall within the proper sphere of the government. People who engage in mining, on the public lands or elsewhere, have no special claim to be protected against the consequences of their own ignorance or over-eager credulity. The hazardous nature of the industry is good ground for rejecting the notion, once generally entertained, that special burdens should be laid upon it—that the mines, in some way not demanded of farms and factories and railroads, should "pay the national debt"—but it is not good ground for asking the government to furnish the technical knowledge required in mining, or to exercise supervision over mining operations. The general aid given to all the industries of the country by a scientific survey, and a complete statistical review of its resources and activities, is all that can be properly conceded; and this will never prevent the complaints of many adventurers who have suffered damage through the risks and difficulties peculiar to mining. The evils of "speculation," of which we hear so much, cannot be cured by legislation, if, indeed (as I do not believe), they are unmitigated evils, or if (as I do not believe) speculation could be repressed at all, without producing something worse. We may set aside, then, all those features inherent in the industry of mining itself, as matters which the government cannot mend, and with which it should not meddle.

Another set of embarrassments arises from the peculiar present conditions of mining in the public domain. The law-abiding instinct of our people is remarkable. The rudeness and violence often observed in our frontier communities cannot hide from the thoughtful observer the deeper fact that our institutions have bred in the masses a notable capacity for self-government. The very first step in a new mining district is the making of laws; and the degree to which such laws have been respected and enforced by public sentiment is a significant testimony in behalf of democracy. But this state of affairs, though infinitely better than barbarism, and certain, as experience has

shown, to pass by peaceful gradations into the complete, lawful organization of society, necessarily involves much initial confusion, bearing the germs of future trouble. The fundamental right of property fails of adequate definition among a host of pioneers settling suddenly, like a swarm of bees, in the trackless wilderness. The entrance upon the public lands of population in advance of official surveys, is the most prolific source of embarrassment arising out of the present conditions of mining in those regions. Nearly all the other evils of this class will cure themselves faster than Congress could cure them. This one, however, needs, in my judgment, a special remedy. It will not cure itself under the present system of land surveys. A system is imperatively called for, which will permit the surveys to keep pace with the pioneers. The exact determination of points of reference all over the country, to which local surveys could be referred, and the abandonment of the futile attempt to lay out our whole national area like a checkerboard, with meridians and parallels, would, I think, be a wise and feasible measure, so far as the mineral lands are concerned. Of the agricultural land system I am not qualified to speak; but it seems plain enough that the reform required for the mountain lands, which mostly contain the mines, would be required also for the valleys inextricably intercalated among them, and occupied with mill-sites and ranches.

I conclude, then, with regard to the evils inherent, not in the nature of the mining industry, but in its present conditions in the West, that they are either (1) such as may be left to cure themselves, or (2) such as the local governments of States, Territories and municipal subdivisions should deal with, as they deal with other matters affecting public peace and the enforcement of contracts; or (3) such as the Federal Government, the owner of the public domain, may measurably remedy by a more nearly adequate provision for the reception of settlers, and the adjustment of their initial relations to the land.

We now come to a class of evils inherited from the earlier (and, to some extent, still continuing) local customs. In my official reports (particularly the first, transmitted to Congress in 1869), to which, for brevity's sake, I beg to refer, without further citation. I have discussed at some length the absurdity of permitting the title to mineral lands to rest upon the shifting and untrustworthy basis of an irregular, periodical *plétic*, the edicts of which are carried out by irresponsible officials, and the records of which often may be, and often have been, exposed, without efficient guardianship, to loss, destruction, mutilation, or falsification. It has repeatedly happened that the disputed possessory title to valuable mining property has turned upon the memory or honesty of contradictory witnesses, concerning records which could not be found, landmarks which had disappeared, "customs" which had been repeatedly amended, repealed, and forgotten, and acts performed pursuant to or in violation of such customs by persons who had long since left the district or the world. Even if all mining recorders were sworn officers; if all their records were properly kept and guarded; if the local regulations were carefully prepared, not liable to sudden change, and permanently preserved for reference, there would still be great confusion arising from the lack of uniformity in the methods of acquiring and maintaining title. Something has been done, as I shall hereafter show, to remove the evils inherited from the miners' "customs." What remains to be done is to abolish altogether the irregular and whimsical subdivisions known as "mining districts," with all their officers, and to make all mining titles on the public lands originate in entries duly attested and preserved in duplicate or triplicate by the regular officers of the United States. Once, this would have been difficult and expensive; but I think the time has come when it can be thoroughly done, and will meet with the approval of the mining communities themselves.

Should the Federal Government attempt to replace all local regulations with a complete mining code? The answer to this question depends largely upon the meaning of the terms employed. It is evident that in all points within the sphere of State governments, legislation should be left to them; and, by analogy, though not with the same force, we may conclude that similar freedom should be accorded to territorial legislatures. According to the principles already laid down, the United States is simply the owner of certain lands, the development and sale of which it desires to promote. It is the business of the local governments to look after the peace and general welfare of the inhabitants; even considerations of political economy, such as the prevention of irreparable waste, would not justify the Federal authority in doing more than to look after its own property. Consequently, it seems to me, nothing should be done by Congress to establish mining regulations apart from such measures as are required to encourage the exploration and purchase of the public mineral lands, and (as incident to this end) to convey to the purchaser definite and secure title.

It may seem desirable, on the whole, that the size of mining claims should be made uniform by law over all the public domain. The present law fixes the maximum length and a maximum and minimum width; but within these limits any size may be fixed by local "custom" or rule; and the liberality of such "custom" is apt to depend upon the number of miners to the acre present when the "custom" is ordained. It must be remembered that the practice of fixing these dimensions by votes of the inhabit-

ants grew up at a time when they involved only the use of the surface for mining purposes, such as dumps, machinery, buildings, &c., and not such an absolute ownership thereof as rendered any intrusion by others an act of trespass. The miner was not limited by his surface in his underground operations; nor did his prior surface right hinder in any way the explorations of other prospectors, or their working of other veins within the space covered by his claim. Hence, very narrow surface claims were adequate appendages to very large mines.

In any attempt to sell its mineral lands, the policy, as well as the clear right, of the United States seems to be to divide the property into parcels of such size as will be at once most convenient to itself and most attractive to the buyer. Under the present law, however, there is no great practical difficulty in consolidating claims so as to obtain a sufficient portion of the main lode, which is the object of the purchase. Moreover, the State and Territorial legislatures have done much, and in many cases have done it admirably, to supersede with definite codes the previous local regulations of the districts. I am inclined to think that the size of claims, *under the present system*, may be left to them, within the limits fixed by the Federal law. If the present law is not changed in any other particular, I do not think it need be changed in this, except so far as to provide for certain cases in which the actual width of a vein at the surface is greater than the width of the claim. This point may be better discussed under a subsequent head.

Passing from the evils inherited from the mining customs, we come to consider such as are the legacy of former Federal legislation. The acts of Congress intended to correct the causes of complaint arising under the absence of all uniform law have entailed upon us some unnecessary complications, which have been further aggravated by conflicting decisions of the Land Office and the courts. The Supreme Court has brought order out of chaos in a number of cases which have reached it; but many moot points remain, and will, perhaps, never be settled, before the necessity of considering them shall have passed away entirely. I refer now to those difficulties only which arise from the features of our earlier laws (principally that of 1866), repealed or amended by later acts with reservation of all vested rights. The law of 1866 has been held in some cases to convey to the patentee under it no real ownership of the surface, but to give him, nevertheless, underground rights which the act of 1872 does not confer. This doctrine was partly overthrown by the decision in the "Eureka case" in 1877; but a recent decision in Utah shows that some courts, at least, hold that, among the vested rights of a locator prior to 1872, the right to follow his vein on the course into the ground of a prior locator is included, and cannot be destroyed even by the patent of the United States granted (prior to 1872) to the prior locator. It is claimed also that parties locating under the act of 1866, though they did not apply for patent until after the passage of the act of 1872, had a "vested right" to obtain, under the latter act, a patent comprising all the privileges granted to patentees under either act. I have elsewhere argued, at length, the unsoundness of these and similar contentions. I mention them here simply to show the nature of the complications inflicted upon us by past legislation.

I do not see that legislation is required to remedy this state of things. The number of mining claims located before 1866, held by uninterrupted possessory title ever since, but not made subjects of patents, is not large enough to require a general measure; and the troublesome questions of so-called "vested rights," accruing under the earlier statute will best be settled judicially.

This brings us to consider briefly the evils developed in the administration of the present law. There is cause for complaint in the expense of proceedings attendant upon the procurement of surveys and the perfecting of titles. Your inquiries in the mining districts will have shown you that these expenses are not only onerous, but exceedingly irregular, being much greater in some districts than in others. As the true policy of the government is to sell its mineral lands, no unnecessary obstacles in the way of costly proceedings should be interposed. And this point is particularly reasonable in view of the fact that the surveyors who charge whatever they can get for their services have in many cases proved to be somewhat careless workmen; so that there is reason to complain of defective, as well as expensive, preliminary work. Changes in the machinery of the law, whether its general principles are changed or not, will be required to remedy such evils. The multiplicity of officials may be reduced; their duties may be redistributed; and they may be paid by the government, and bound to pay over to the government all their legally-determined fees. The result should be a saving to the people and no loss to the public treasury.

We have considered briefly the inherent, the inherited, and the administrative evils of our Federal system of mining law. We now take up, in conclusion, a fourth class of evils attendant upon that system, namely, those which flow from the main features of the sections of the Revised Statutes constituting our only national mining code, and which require, as a remedy, important changes in the law, not mere reforms of administrative detail, such as have been alluded to under foregoing heads of this discussion.

I repeat the declaration already made as a starting-point, that the true policy and

avowed purpose of the government is to sell its mineral lands on such terms as will promote their exploitation. Whatever may be the alternatives to which we are now shut up, we had, in the beginning, the possible course of renting the mines, or in other ways getting a revenue from them. I have already expressed my views on this point, and it may, therefore, be passed without further comment. Assuming, however, that the mineral lands should be definitely disposed of, the government might have, secondly, transferred them to the States as fast as these were organized and admitted, or, thirdly, sold them in large quantities to private persons or corporations. In either case, the expense of surveying and selling in detail would have been saved. But the public advantages sought by the system actually adopted could not have been attained under any plan which permitted a monopoly of the lands, or the growth of conflicting rules in different localities as to the exploration and acquisition of mineral property by individuals. It may fairly be maintained that the retention of the mineral lands by the general government, with a view to their sale under uniform laws, to bona-fide miners or mining corporations, was, under the circumstances, wise.

But the law, as it stands, fails to secure fully the objects for which it was designed. What it should do, to secure those objects, is to encourage prospecting merely as a preliminary to purchase; to hold out inducements, or even apply pressure, which will lead the "possessory owner" or temporary occupant of a mining claim to become, as soon as practicable, its purchaser; and to give to each purchaser a definite and secure title, as a protection to him, on the one hand, and to the intending purchaser of a neighboring claim on the other. In all these points, the law is more or less defective: and its defects may be classed under two heads. Those which spring from the right to follow a lode in depth outside the side lines of the surface claim constitute the first class; and their consideration involves the question, whether it would be wise and practicable to cease granting this right, and limit by vertical planes drawn through the side-lines as well as the end lines of surface claims the ownership of mines patented hereafter. The defects which may be remedied without this fundamental change in the law constitute another class; and of these I purpose to treat first, concluding my survey of the subject with a consideration of the so-called "side-line question."

Assuming that the right of the mine owner to follow and exploit his lode in depth between the projected end lines of his claim and beyond its side lines should be retained, the present law is still radically defective in several particulars. The theory of it is that, as a preliminary to purchase, the citizen may freely occupy and explore any portion of the public mineral lands not already occupied. This possessory title must be maintained by the performance of a certain amount of work annually. The amount fixed by the law is not enough to secure a real development of the mine; but it is enough to discourage the practice, once common, of the holding of many claims by one adventurer, to the exclusion of those who would gladly work them, and it furnishes a good legal test of the otherwise indefinite act of abandonment. I doubt whether this feature could be changed with advantage. But the present law, by conferring upon the possessory occupant rights as extensive as those of a patentee, and by permitting the possessory title to remain undisturbed and invulnerable for an unlimited period, offers too little inducement to the locator to apply for a patent. Indeed, in a large number of instances, the inducement is the other way. Not only the expense of the proceedings for patent, and the chance of suffering local taxation, as owner of land, to which the mere squatter upon government land would not be subject, operate to the advantage of the mere locator and the disadvantage of the patentee; but the application for a patent involves the precipitation of all pending contests as to title. Adverse claimants must then speak, or forever after hold their peace. The result is, that locators often delay applying for patent, in order not to arouse opposition which they hope to wear out in time; and disputes are thus nursed along, instead of being brought to an issue, and definitely ended.

It seems that only two strong inducements to take a patent arise under this law. If a possessory holder wishes to be able to abandon his mine for a while, without losing it, he must get a patent. If he wishes to sell it to a distant capitalist, or to a stock company, he must usually get a patent, because such buyers usually (and always should) insist upon this security against adverse claims. Unless these contingencies arise, there seems to be no special reason for taking patent.

In my judgment, the law should limit the period of possessory ownership; should not authorize the working of lodes in depth outside the side lines of locations until after the patent has been applied for (even though, as now, that right be granted by the patent); and should render the holder of a possessory title only incapable of enforcing an ejectment against parties working on his lode beyond his side lines, or of collecting damages, after he has applied for a patent, for ore so extracted by others before he made such application—under which term, in the present connection, I mean to include all the steps required of the applicant for the proof of his claim.

It may be said that, under such a law, locators might still go on indefinitely, by the simple expedient of repeated relocation. I admit the force of this objection; and I do

not think a prohibition of such relocation by the same parties would be very effectual, since it would be easy for them to evade it by employing others to make the record. But I apprehend that the consideration of the loss of priority in title by relocation would be a powerful objection to the course; and, at all events, it may be safely asserted that the inducements to apply for patents would be stronger than they now are.

I would mention, in passing, the limitation of the right of purchase to citizens as a feature of the law which serves only to annoy foreign purchasers, without preventing them from really holding mines. A citizen may convey his patent "to any person whatever"; and this being the case, why not let "any person whatever" buy the mine and get the patent? As it is, foreign corporations manage to control our mines, if they choose; and our citizens are never weary of inviting foreign capital to do so.

The law as it now stands, and as it has been in some cases at least construed by the courts, operates to the discouragement of the most enterprising kind of explorations, namely, explorations by shafts or tunnels. Section 2323 of the Revised Statutes says that the owners of a tunnel "shall have the right of possession of all veins or lodes within three thousand feet from the face of such tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface." In this grant, I believe the words "on the line thereof" have been so construed by the Land Office as to exclude veins crossing the tunnel, and thus to reduce the section almost to a nullity; but even setting aside this construction, the phrase "to the same extent as if discovered from the surface" is enough to destroy all tunnel claims. For it is held that the discoverer of a vein "from the surface" can acquire no title, not even a possessory one, unless he finds its outcrop, and locates his claim to include that. If I remember correctly, the Land Office has refused to grant a patent for a vein discovered in a tunnel; and I confess that it is difficult to see how any other decision could have been made under the circumstances. A patent requires a surface location, and that location must include the outcrop or the "top or apex" of every vein for which the patent gives title.

The tunnel section might as well be repealed. It is worth nothing to anybody as it is now framed and interpreted. But I think it would be just to declare that the discoverer, in ground not already occupied, of a vein not previously known to exist, wherever and however he may discover it, by shaft or tunnel, at its outcrop or in depth, shall have the right to locate a claim covering the point of his discovery, and to obtain a patent entitling him to work that vein as if its outcrop were within his claim. I say this would be just; and it would encourage enterprise and promote the discovery of valuable deposits not otherwise likely to be exposed. But it would seriously complicate the relations of patentees and locators. Less effectual, but perhaps more practicable, would be a provision authorizing the record of an underground discovery of a new lode, and giving to the discoverer a certain time within which he may seek for the outcrop or apex of the lode, and, upon finding it, be entitled to locate upon it, with the date of his underground discovery. If the outcrop or apex, when found, should happen to be covered by a patent, that ought to take precedence; but a mere location of later date than the underground discovery ought to give way. The guiding principle here is to encourage prospecting as much as possible; but, above all, to encourage the taking of patents.

Another defect of the law, or its construction, is the vagueness of the title conveyed under it by a patent. There is nowhere in it any definition of the terms "deposits," "veins," "lodes," "ledges," "dips," "variations," "angles," "locations," "claims," &c., which are freely used. Some of them are merely tautological. Such phrases as "vein, lode, or ledge," "dips, variations, and angles," merely lead to hair-splitting constructions by puzzled jurists, who try to discover shades of meaning in what was probably nothing more than aimless rhetoric. The adoption of all the ordinary miner's terms without definition constitutes one of the most troublesome elements of the bondage to local customs which has fettered our legislation. Even if Congress should declare the mining law to be independent of such customs, the declaration would be futile so long as the customs must be appealed to for the interpretation of the law. The meaning of the terms "vein," "lode," and "ledge," for instance, although much clarified by judicial decisions, is still subject to doubt. In a recent case in Colorado (which I cite, not to assail the ruling, but to illustrate this point), it was held that a "contact bed," or deposit, admitted to be legally a vein, did not begin to be a vein at its outcrop, because that was barren of precious metal, but did begin to be a vein, or in other words had its true outcrop or apex, at the point where it first showed by assay "an ounce or more per ton" of silver.

Now, any law or construction of law which makes the miner's title dependent upon subtle geological or chemical distinctions is unfortunate. As far as practicable, the statute should be so worded as to avoid such contingencies.

Another serious embarrassment of a similar nature arises from the construction which has been put upon the phrase of section 2322, "the top or apex of which lies inside of such surface lines extended downward vertically." Under this clause it has been held that unless a locator includes within the width of his claim the whole width

of the outcrop or apex of a lode, he cannot acquire the right to follow that lode beyond his side lines. This ruling has been applied in cases in which the local laws actually forbade the locator to make a claim wide enough to include the lode. It is easy to see that in such a case two or more locations may be made side by side on the same lode, and neither of the locators possess the right to follow it in depth. The remedy appears to be to consider the prior locator or patentee as entitled to the lode, and a slight change in the statute would put this beyond doubt; or else the provisions of section 2320 might be so modified as to forbid the limitation of width in mining claims by local regulation to a less width than that of the vein itself at the surface; or parties holding locations side by side, comprising the outcrop, which neither of them singly covers, might be allowed to consolidate their claims and thereby acquire a right which, under the present construction of the law, I suppose they could not acquire by consolidation, since they do not severally possess it beforehand.

But all these and many more ambiguities and uncertainties arising under the present law have their ultimate origin in the attempt to encourage the purchase and development of mineral lands by granting to the locator and patentee something more and at the same time something less than the contents of his claim, according to the ordinary common-law practice. Strictly speaking, the present system is, as I have shown, equally in accordance with the common law. But the ordinary common-law practice is that the boundaries of the mining rights are the vertical planes drawn through the boundaries of the surface tract. The convenience of this practice is attested by its universality. Land goes from hand to hand in parcels, and even when the mining rights have been alienated the unit of land measurement naturally remains the unit of measurement for the mining right. Our mining law involves endless trouble in its attempt to combine two units, the surface and the lode. Before the law was enacted the miners had but one unit, namely, the lode. Surface ownership there was none, only an easement or privilege of using the surface when necessary for mining operations. It may be questioned whether the present system is an improvement.

In the report which I had the honor, as United States Commissioner of Mining Statistics, to present to the Secretary of the Treasury, January 18, 1869, and in which the subject of the mining law was discussed, I used the following language:

"The Spanish and English laws, as I have shown, invariably bound mining claims by vertical, just as the property of land-owners is bounded. The modern Prussian law does the same thing. But, according to the present codes of other German states, and the ancient codes of all, inclined locations may be granted, with the right to follow the vein in depth, without reference to the surface ownership. The American miners' law is unlike either, and, so far as I know, has no parallel in history. It comprehends the vein, its dips, spurs, and angles, to any depth; and under this provision, when two veins are found to meet in depth, the oldest location is held to be the main lode, and the other is confiscated as a 'spur.' (The word 'spur' is omitted from the United States law of 1866; but the sweeping recognition in that law of 'mining customs' virtually restores it.) There is no justice in such a provision. On the other hand, there is no limit in American local regulations as to the distance between parallel locations, which, no matter how closely they lie together, are presumed to be on different veins until proved to be on the same. This state of things both invites and protracts a litigation which is seldom settled except by exhaustion and compromise.

"There are not wanting those who urge the adoption of 'square locations' exclusively as the cure for these evils. But with such, after mature reflection, I cannot agree. The great aim of the government, in disposing of its mines should be to secure their permanent and systematic working. To define the boundaries of mining ground by vertical planes does indeed lessen the danger of litigation; but it also lessens the value of the claim; and, in most cases, the value thus subtracted from one property is not added to any other. Thus, a miner under the Spanish law loses the right to work his vein because, at the depth of 600 feet it passes out of his surface boundaries into the neighboring claim; but the neighbor is not much better off for knowing that 600 feet below the surface he may find a vein of ore. To the miner who has already reached that depth it is valuable; to the miner who must dig and blast 600 feet to find it, it may be worth nothing. Meanwhile it is undoubtedly for the interest of the country that the work should be continued in depth; and the proper person to carry it on is evidently the one who has commenced it and prosecuted it thus far. \* \* \* For the present stage of mining in this country, as for the earlier stages of mining in Germany, the inclined location must be accepted as the best for lodes."

My later reports and publications show a more decided recognition of the advantages of vertical boundary planes, now almost universal among civilized nations. But they also repeat the one consideration, which seemed to me decisive, ten years ago, against that system, and which still constitutes the chief objection to it. I mean the encouragement to deep mining held out by the present system, or, rather, the encouragement to the investment of capital in mining, constitutes in the knowledge that the valuable mineral deposit may be followed indefinitely in depth. Can that advantage be in any way secured under a system of vertical boundaries?

I shall waste no time in vindicating personal consistency in this matter. It might be shown that ten years have changed the conditions of mining in this country and the features of the mining law more than they have changed the views embodied in the long argument from which I have quoted. Our mining districts are better known; it is more easily practicable to measure and define the surface-unit at the beginning of operations; the vague rights granted by miners' custom have been largely shorn and restricted by definition. Above all, the present requirement that the survey of a claim shall not be changed after first location, except by relocation (sacrificing prior estate of title), and that it shall convey only that portion of the mineral deposit of which contains the outcrop, top, or apex, utterly revolutionizes the spirit of the former system, and reduces to a slender remainder the "rights of the discoverer." It is no longer possible for a citizen discovering valuable mineral in place to claim it by virtue of priority alone for an indefinite period. He must make haste to find its top or apex or outcrop before any one else; then he must make haste to locate a claim including that upper edge; and by that location, however wisely or unwisely made, he must abide through all subsequent proceedings for title. The certainty of a location carrying absolute ownership of a tract and its contents would be in many cases far better for the miner than this combination of the chance of getting a great deal with the risk of getting nothing.

But assuming that a change could be effected in the present administration of the statute, or in the statute itself, by which more freedom should be given to the locator, assuming that, in the majority of cases, the discoverer actually finds and successfully locates upon the outcrop of his deposit, then there is certainly a real encouragement for him in the knowledge that he can follow the deposit in depth. Can this be secured under a system of vertical side boundaries?

Two expedients only are suggested. The first is to vary the size of the claim, as the Spanish law does, according to the dip of the deposit. This is open to the gravest objections. It delays the definition of the surface claim (to the manifest injury of neighboring explorers) until the mine has attained a certain depth. The Spanish law makes this depth ten yards, and the dip of the deposit for the first ten yards is taken as the basis for determining the width of the claim (which, however, never exceeds 100 yards on either side of the outcrop). It may fairly be said that this offers little security to the locator. The uppermost thirty feet of a vein are, perhaps, more likely than any other part of it to show a false, local dip. Yet it would not be practicable to require a greater depth, and hence a greater delay, before settling the boundaries of the surface claim.

But if we cannot well vary the size of the claim according to the features of the deposit, the only other expedient is the granting of a tract sufficiently large to offer as great encouragement to miners as is now offered by the peculiarity of the underground ownership. In my report, above quoted, I mentioned 40 acres as the size of the "square location," which would in many districts be necessary to effect this purpose. But that statement needs explanation and qualification. Let us first assume that the location is square in form. The tract of 40 acres is then 1,320 feet square. If the outcrop of a vein runs along one side of it, dipping into the tract—the most favorable case for the locator—the location commands 1,320 feet of the strike, and a distance on the dip indefinitely great as the position of the vein approaches the vertical, and diminishing as it approaches the horizontal, toward a minimum of 1,320 feet. Assuming, as an average case, the dip of  $45^\circ$ , the depth of vein within the tract would be about 1,867 feet, and the vertical depth at the point where it leaves the tract 1,320 feet.

For many reasons, however, it is not to be supposed that square claims would be generally, or even frequently, so located as to carry the outcrop along one side. Assuming, then, as an average case that the location, of the form and size now under discussion, carries the outcrop through the center, and parallel with two of its sides, we have for a dip of  $45^\circ$  a distance on the dip, within the location, of 933 feet. This is not too much, if a single vein is taken into consideration; and if a mining district is to be surveyed according to the present land-surveying system, with the square mile as a basis, and meridians and parallels as the boundaries, and if such survey is to be independent of the course of the mineral deposits, and the mining locator or purchaser is to be obliged to choose his location among the squares thus defined, I think the square of 1,320 feet, or  $\frac{1}{16}$  of a square mile, is at once the most convenient and the smallest which can reasonably be fixed as the size of a claim.

But I thought in 1869, and I think still, that the area of forty acres is too great to be accepted by the mining communities, and that the attempt to introduce it would cause much trouble, particularly in districts where several parallel veins might cross such a tract. But few prospectors (sixteen to a square mile) could get a foothold under such a system, and those few would occupy at the outset all the valuable mining ground. Prospecting would be discouraged, and the motive which supplies our new mining camps with the population absolutely necessary for a supply of labor, the establishment of communications, &c., would be almost destroyed.

Hence, I think the attempt to lay out the mineral land in fixed squares would not

be wise. If the claims were permitted to have, on the other hand, any form and position, a minimum width (or, better, a maximum length) and maximum area being prescribed, one-half the area of 40 acres would suffice to secure substantially equal advantages to the miner; and this is the size which I venture to recommend.

Judge Hallett, of Colorado, in an able review of this subject, addressed to your honorable commission, advocates the absence of restrictions as to form and position of locations, fixing the size as not exceeding ten acres, in any form not less than 100 feet wide at any point. This would permit a maximum length of 4,356 feet; and cases might easily arise in which this length would be located. Given, for instance, a well-defined vein or bed, easily worked near the outcrop, and yielding above water level oxidized ores reducible cheaply, say, by amalgamation, it would be the interest of a locator to take up 4,356 feet by 100 feet along such a vein, with the intention of running its upper portion by an open cut, and then abandoning it. To encourage this would be to discourage systematic and permanent mining. Hence it would, in my judgment, be preferable to fix no minimum width, but a maximum length of location in any direction of 1,500 feet. This length would permit, for the area of 10 acres, a width of about 290 feet, which is, in my judgment, not enough. For the area of 40 acres, the width for the maximum length might be 579 feet, which is sufficient to encourage permanent mining. It is true that many, perhaps most, deep mines would extend beyond such a width. For the average case we have been considering, of a vein running through the center of the claim and dipping  $45^\circ$ , this width would give but 410 feet of mining depth; but it may safely be presumed, as Judge Hallett remarks in a letter to the Denver Tribune, that this point will be met by "the ability and disposition of capitalists to gather up a sufficient area for deep mining where the existence of valuable ore may be shown." In other words, a capitalist will buy the neighboring claim if he needs it. Judge Hallett, however, uses this argument in favor of the ten-acre claim. I submit that such a claim is too small to secure the necessary deep mining to satisfy the mine-owner of the permanence and value of the deposit; while, on the other hand, if a rich and valuable vein passes out of a claim of 1,500 by 290 feet, it is likely to enter the adjoining claim at so small a depth below the surface as to invite the owner of that claim to work it himself, or hold it at an exorbitant price. Judge Hallett's proposed claim is less than one-half as large as the maximum now permitted by the United States law. The size which I suggest is nearly the same as the present maximum (1,500 by 600 feet).

In all the suggestions which I have heard on this subject, it seems to have been taken for granted that no location should be made until after the discovery within of "valuable mineral." This phrase is vague enough, and the administration of the part of the law containing it is very likely to be a farce. If the condition could be removed without detriment to the public interest, the whole problem would be greatly simplified. So far as the government is concerned, it seems a simple proposition that if the government is willing to sell agricultural lands at \$1.25 per acre, and mineral lands at \$5 per acre, it would have no reason to object to sell the latter and take the money, leaving to the purchaser the risk of value. We do not ask the settler upon agricultural land to prove the fertility of the soil before we sell it to him. He pre-empt or buys at his own risk. We guard against monopoly of land, so far as we can, by limiting the size of the pre-emption claim. We can do the same thing to the same degree by limiting the size of the mining claim. In neither case can we prevent people who have the desire and the means from buying up farms, or land warrants, or mineral land patents, and then working upon the property or not as they see fit.

Under our present system, a patentee may allow his mining property to lie idle if he chooses. If he does so choose it is manifestly immaterial to the public whether there is really a mine there or not. But the locator, we ordain, must have found a valuable mineral deposit, and must bestow upon it, to maintain possessory title, a certain amount of work annually. The only reason that I can discover for this rule is the desire to prevent a mere locator from holding without developing a piece of ground in which, otherwise, some one else might find a valuable mine. If the miners were owners under patents, we should, and safely could, leave the question of working or not working to their self-interest. Any mine that promised to be profitable would be worked or sold in the course of no very long time. The policy of the government, as I have explained, is to encourage prospecting as a preliminary to purchase; to induce prospectors and possessory owners, by every practicable means, to take patents, and to grant patents on terms so easy and for tracts so small as to favor the miner of limited capital. It seems to me that these ends might be secured by a simple system like the following:

Let mining locations be made anywhere on unoccupied public lands, whether a discovery of mineral has taken place or not. Fix the maximum area at 20 acres, and the maximum length at 1,500 feet. Allow the locator to occupy by possessory title for one year—adequate evidence of the boundaries of the location being maintained on the ground as well as in the record. Require a certain amount of work for each 100 feet in length of the location to be performed as a condition of relocation. At any time

any the year, if the locator applies for patent, sell him the tract. If he desires to mine to occupy by possessory title, require him to give notice to that effect, together with proof of the performance of the prescribed work, before the end of the year; and at the end of the year, *unless some other party has, at least sixty days before, an application to purchase*, issue to the locator the certificate of his possessory title for the year, on the same conditions. But if application to purchase has been made by some other party, and not by the locator, then the latter, during the last sixty days of the year, may elect whether he will purchase or vacate the claim. In case no such application has been made, and the locator has not appeared before the close of the year with his proof of work done, let the claim be open to relocation by others.

Under this system, the locator would occupy the position of a tenant, to whom the proprietor should say, "I will let you have this property for one year, with the option to buy it at any time at a nominal price. At the end of the year, if you have done a certain small amount of work on the property, I will let you have it for another year, unless a purchaser appears. In that case, I shall sell it—to you if you choose, or else to some one else. But if you neither buy nor improve the property, and no purchaser appears, I will put somebody else in your place on the same terms as I offer you."

Thus we should get clear altogether of the mineral deposit or lode as a unit, and settle all proceedings on the land. The officers of the government, from the registered surveyor to the judge, would be relieved from the duties of mining experts, and geologists, chemists, and mining captains would no longer be called upon as witnesses to settle by hair-splitting distinctions the right of property. If any radical change in our mining law can be successfully made at the present time, I believe this plan would be as practicable as any, and more beneficial than any, which have come to my notice. If this, or something like this, cannot be adopted, then it seems to me that it would be wiser to amend in detail our present law, rather than attempt changes which would be revolutionary without being remedial.

There are many points still needing discussion. Whether the lines of a location could be alterable by resurvey before application for patent (I would say, Yes; the rights of neighboring locators being respected); whether a prospector should have any rights prior to a regular survey and record of location (I would say, Yes; the right to stake off his claim provisionally, and to lose nothing by delay of the government officer in making official survey—all this under proper regulations); whether a prospector, simply roaming over the public land, and finding "mineral," should have any right by virtue of discovery (I would say, No; but his commencement to stake off or mark the boundaries of a claim should give him the inchoate right to that claim, to be perfected, however, by continuing and finishing the proceeding); whether one year, as I have suggested, is the proper term; whether sixty days, suggested in another place, is the proper term; whether possessory owners should be notified, by advertisement or otherwise, of applications to purchase, at the end of their term, the claims they are occupying; whether such notice should be given at the expense of the party acquiring the claim, or whether it is sufficient that these facts should be kept in accessible records, and the possessory owner obliged to consult the record thirty days (or some other fixed period) before the end of his year, to discover for himself whether there is a promising purchaser; how far present possessory owners can be forced to take patents or to accept the terms of the new law (I fear nothing of this kind can be done so long as they obey the terms of the present law)—these and many other questions of detail arise; but I cannot see in any of them difficulties which would constitute insuperable objections to the proposed system, or which would justify me in prolonging further these communications, for the length and diffusiveness of which I ought rather to offer my apologies.

Yours respectfully,

R. W. RAYMOND.

## APPENDIX C.

### INFORMATION AND STATISTICS GIVEN BY MESSRS. HAGGIN & CARR RELATIVE TO IRRIGATING THE FARMS OWNED BY THEM IN KERN COUNTY, CALIFORNIA.

SAN FRANCISCO, CAL., December 3, 1879.

DEAR SIR: I send you to-day reports of several engineers in my employment who have been engaged in the work of reclamation. They will show for themselves. Also a tin case containing maps: First, a map of that portion of Kern County in which I am interested, embracing all the desert lands in that section and showing the various ditches; second, maps A, B, C, D, which are referred to in Fillebrown's report and are explained thereby. These are maps made from actual surveys, and are the various maps that the different members of your commission desired. In the Fillebrown map, showing the checks, he has only put down the checks between two of the ditches, omitting the balance, as the map is on so small a scale that the blue lines would be very numerous and very close together if carried out.

The reports are private reports and were not prepared for publication, but as I see no better way of giving to your board all the information it may desire, I send them to you to make such use of them as the board may deem proper.

Yours truly,

I. B. HAGGIN.

Hon. J. A. WILLIAMSON.

*Commissioner General Land Office, Washington, D. C.*

—

*Report of T. R. Fillebrown, engineer of Irrigation District No. 4, dated November 25, 1879*

To Messrs. HAGGIN & CARR, San Francisco:

GENTLEMEN: In accordance with your instructions I herewith submit my report of work performed under my supervision during the past year for the irrigation of the dry lands north of Kern River and below the line of the Calloway Canal, known as District No. 4.

#### I.—CALLOWAY CANAL.

Cost to April 1, as per estimate returned (W. H. Broad's contract).....	\$61,536 72
Ranchero's wages and repairs for April, May, June, and July, as per check drawn in favor of E. M. Roberts, ranchero.....	523 25
Repairs by Fred. Stineman, removing temporary dams, clearing out obstructions, &c., as per amount placed to his credit on account of Belle View Ranch.....	165 61
Earthwork by teams belonging to Belle View Ranch, April 1 to date.....	2,680 57

#### Poso Creek Weir:

Lumber, including freight and hauling.....	\$928 60
Carpenters and laborers, including board.....	580 75
Pile-driving, including board of men.....	303 50
Hardware and nails.....	289 98
Blacksmithing.....	72 00
	2,174 83
Engineering and superintendence.....	1,025 00
Total cost to date, not including amount paid to O. P. Calloway.....	68,164 57

NOTE.—In addition to the foregoing there is about \$10,000 paid to Calloway for work that he had done before Mr. Higgins acquired the ditch.

Work is now in progress near the head of the canal, repairing and raising the banks, principally along the Kern River Slough, the cost of which, not having been determined, cannot be embodied in this report.

## II.—BRANCH DITCHES COMPLETE TO DATE.

Ditches 20 feet wide, $6\frac{1}{8}$ miles; cost .....	\$5,843 33
Ditches 16 feet wide, $50\frac{1}{8}$ miles; cost.....	35,179 78
Ditches 12 feet wide, $3\frac{1}{8}$ miles; cost.....	2,265 87
Ditches 8 feet wide, $3\frac{1}{8}$ miles; cost .....	1,869 83
Total length $64\frac{1}{8}$ miles; cost.....	45,158 81
Engineering and superintendence.....	4,300 00
Total cost, including head-gates and weirs.....	49,458 81
Average cost per mile.....	768 44
Add 20 side-gates per mile, at \$12.....	240 00
Total cost per mile, including weirs and side-gates.....	1,008 44
The above ditches will irrigate 16,160 acres, making the cost of ditching per acre.....	4 00

## III.—NUMBER OF ACRES CHECKED TO DATE.

Number of acres checked to date, ready for cultivation, including work done on Poso Ranch and by tenants.....	5,956
Average cost per acre.....	\$1 64
Cost per acre for waste-gates.....	51
Total cost of checking per acre.....	2 15
Total cost, ditching and checking per acre.....	6 15

The Calloway Canal is constructed 80 feet wide on the bottom, with banks 5 feet high and 4 feet wide on top, with inside slope of four to 1 and outside 2 to 1, from Kern River to Poso Creek, a distance of 30 miles, at which point the upper bank stops and connects with a levee extending up the banks of the creek to a point where the natural surface is as high as the top of the canal bank. A similar levee is built on the north bank of the creek, thus converting that portion of the creek into a pond or reservoir. In connection with the lower bank of the canal in the bed of the creek is placed a weir 150 feet in length, with wings at either end 20 feet long, extending into the banks.

A plan of this weir is herewith submitted, marked A, an examination of which will better enable you to understand the nature of the structure and the duties it is expected to perform. This weir is divided into 25 gates of 6 feet span each, from center to center of posts, so constructed as to be raised from the bottom by means of a chain passing round a windlass, which is turned by a movable iron lever. A bridge for horsemen is also provided on top of the weir.

By this means the water of Poso Creek is made available for irrigating the land north of the creek and for several miles south, the grade of the canal being so slight that the water from the creek may be backed up the canal for several miles.

In case of very high water, which may occur during some winter seasons, these gates may all be raised, allowing the water to pass down the creek in its usual channel. Should the canal and creek become partially filled with sand at their intersection, which is likely to occur, by raising the gates of the weir a few inches and allowing a small stream to pass through the sand will be readily sluiced out and carried down the stream.

This creek is entirely dry during a considerable portion of the year, but in most winter seasons carries quite a large volume of water for a short time, which water will be utilized in the manner above stated, and added to the available supply for irrigation of lands adjacent to the creek.

North of Poso Creek the canal is at present extended but three-fourths of a mile to accommodate the tenants who have leased land on that side. This portion is but 160 feet wide on the bottom, but is otherwise constructed the same as the other portion.

The canal has a grade of eight-tenths of a foot per mile, which gives it a theoretical capacity of 894.7 cubic feet per second to the end of the eighteenth mile, at which point it is reduced to four-tenths, and is constructed upon that grade to the terminus, the diminished grade admitting of the canal being run upon a little higher ground, thus bringing more land within the reach of irrigation, and at the same time not materially reducing the capacity of the canal, the taking out of each branch ditch having the effect of accelerating the flow, and at the same time diminishing the requirements of the canal by the amount discharged by such ditch.

These branches, with a few exceptions, have been constructed 16 feet wide on the bottom, with banks  $3\frac{1}{2}$  feet high, intended for 3 feet of water, with slopes 3 to 1 and a grade of 1.6 feet per mile, giving to each a capacity of 196.5 cubic feet of water per second.

The ditches are provided, at intervals indicated by the fall of the land, with weirs by which the flow is regulated and by which means the water may be held in any section of the ditch until it rises if necessary to top of the bank and is forced out through side gates (which will be more fully mentioned hereafter) on to the adjacent land.

In adopting a grade for these branches I have not been guided by the quantity of water which might be required (a quantity very difficult to determine at present, for reasons which I will state further on), but have given them as rapid a grade as I thought the banks would stand without washing, judging from a limited experience upon this character of land.

The descent of these lands to the westward being from 12 to 20 feet per mile, all the excess of the grade of 1.6 feet per mile is overcome by drops, each weir having a vertical drop of from  $1\frac{1}{2}$  to 4 feet, depending upon the descent of the ground. Should the velocity be found so great at this grade as to cause washing of the banks, each weir furnishes ready means of diminishing the grade, and consequently the velocity to any required degree.

A plan of weir for 16-foot ditch, with 3-foot drop, is herewith submitted, marked B, and is made a part of this report.

Levees or checks have been and are being built, extending from the bank of one ditch to that of another, following the contour of the ground, each check being on ground 1 foot lower than the preceding one, and built  $1\frac{1}{2}$  feet high, to make allowance for settling and yet hold the water until it rises to the base of the next higher check. Each check is provided with a waste-gate, and in some instances two, for draining the water off the ground above it on to that below when the former becomes sufficiently saturated. A side-gate in the bank of each ditch delivers water to the land above each check, thus giving to the tract of land between any two checks a supply of water from two ditches at the same time, besides the surplus water delivered through the waste-gate in the check above.

The accompanying diagram, on a scale of 5 chains to the inch, marked C, shows a section of the main canal, with a portion of two ditches, with weirs, gates, checks, &c., as actually constructed, and will render the system clear and easily understood. The same exhibit shows also a cross-section of the main canal and of a 16-foot ditch, also a profile showing a small portion on an enlarged scale, with water standing upon the ground.

Persons who have irrigated land by this system, upon a small scale, state the annual expense of distributing the water at from 10 to 25 cents per acre. I am of the opinion that when the levees are thoroughly settled and the plans properly carried out it will be brought within the smaller figure; admitting, however, that it may reach the maximum of 25 cents, it will still compare favorably with the system of small ditches in use elsewhere, where the annual expense of irrigation ranges from 75 cents to \$1.50 per acre.

The map marked D (scale 40 chains per inch), herewith submitted, showing the three townships in which this system is being carried out, together with the three adjoining townships on the west, gives the correct location of the main canal through these townships and all branches constructed to date, denoted by a full red line; also a small tract of about 350 acres of very uneven ground (mostly on sections 16 and 21, township 27, range 25) as it is checked; and also the last, or most westerly check now constructed between each two ditches—the lines denoting checks being drawn in blue. I have also drawn on this map dotted lines, showing approximately the proposed extension of these ditches.

These last lines, of course, will be subject to many alterations upon a careful instrumental survey, but they will serve the purpose for which they are alone designed, namely, to give a general idea of the number and extent of ditches necessary to be constructed to irrigate all the arable lands which may and should be embraced in this one system of irrigation.

The ditches are located upon the highest ground, following the meanderings of the ridges wherever there is a material difference in elevation, but when the elevation to be gained by deviating from a straight line is slight and immaterial a straight line is of course preferable.

By a glance at this map, therefore, it will be seen that, desirable though it may be for convenience in the cultivation and harvesting of crops to construct ditches and levees straight, and upon or at least parallel to the section lines, such location would be incompatible, in most cases, with a thorough, practical, and economical irrigation of the land, and when it is understood that these levees are built with broad bases and consequently flat slopes, so that farming machinery may be easily driven over them, the difficulty in the way of working the land becomes, I think, more apparent than real.

In the location of branch ditches I have been annoyed in some few instances by being obliged to deviate from the proper line as indicated by the topography of the country to avoid trespassing upon the pre-emption, homestead, or other claim of some sheep-herder who has filed his claim upon 80 or 160 acres of land for the purpose of grazing the entire plain during the winter months, and whose claim invariably becomes very valuable, in his own estimation, as soon as it becomes known to him that it is in the way of the proper carrying out of any other enterprise.

To segregate these lands into small ranches of quarter, half, or whole sections, either for purposes of lease or sale, to be bounded and defined by exact section lines, will conflict more or less with the proper carrying out of this system, which system I believe to be for the lands of this character the most practical and economical which can be adopted.

Should it be found necessary or desirable to make leases or sales by sections or extensive subdivisions of sections, it will be necessary to construct division levees upon the section lines, which will in some cases considerably increase the cost.

You will observe that in stating the cost per acre I have not included the item of proportionate part of cost of main canal. This it is impossible to arrive at with any degree of accuracy until it is more fully determined how many acres can and will be irrigated from this canal.

The number of acres in this district, between the canal and Goose Lake slough, is something over 200,000. To irrigate the entire district would, therefore, evidently necessitate a material enlargement of the canal, and, in all probability, an increased supply of water from the river. The acreage which will be irrigated, therefore, must depend mainly upon the extent to which these works are carried out, a question too broad in its scope to be more than alluded to in this connection.

Attention has frequently been called to the question of increasing the available water supply of Kern River to meet the growing demand of this valley by the construction of mountain reservoirs. This is a question of vast importance, and is worthy of more close and careful consideration than it has yet received from any one.

The work of construction under my charge has demanded my entire attention and prevented my making any personal examination of this subject. I have been informed, however, by persons familiar with the mountain region through which Kern River flows, and in whose judgment I have much confidence, that there are small valleys along its course which may be converted into reservoirs of almost unlimited capacity, at comparatively slight expense, by the construction of dams across the narrow cañon now. I can, of course, make no estimate of the cost of such works at present, having no data to work from, but call your attention to the matter again in order that the importance and ultimate necessity of such works may not be lost sight of. I am not advised to what extent the State engineer corps has investigated this question, but presume it has not wholly escaped their notice.

This land in this district in its present condition is very dry and porous, and will absorb a large quantity of water at the first irrigation, which quantity will gradually and very materially diminish with each succeeding irrigation. The fact that most of these lands have an underlying stratum of either hard-pan or clay, from 1 to 4 feet below the surface, gives some assurance that, after once thoroughly saturated, they will retain moisture longer, and therefore require less water than lands on Kern Island, or in most other portions of the San Joaquin Valley.

You will observe also that the ditches already constructed have the capacity for discharging several times the volume of water that the main canal will carry. It must be remembered, however, that these ditches will seldom, if ever, be run to their full capacity, that they will not all be running at the same time, and that the crops depending upon them when they are running will not all require to be irrigated at the same time. The banks have been built high, so that the water can, by means of the sills, be held in any section of a ditch until it rises high enough to cover the highest ground adjacent to the ditch, upon which it is delivered through two or more side-gates; which side-gates are so placed as to deliver the water first to the highest ground between any two checks, so that the high ground becomes partially irrigated by the running of the water over it, thus lessening the time necessary to keep the lower portions flooded.

I have also had in view the ultimate deepening of the canal to a depth of 8 feet, according to your original intention, which has been very properly deferred, however, until such time as the further settlement and cultivation of the land shall call for a larger supply of water than its present dimensions will furnish.

Returning again to the lands now ready for cultivation in the district under consideration, I will state more fully relative to the rented lands. In 1877 you built five houses, barns, corrals, &c., in this district. These have been occupied since that time by thrifty farmers, raising crops of wheat, barley, and some oats. Some fruit-trees have also been started at most, if not all, of the places. These ranches are all irrigated from the Calloway Canal by means of small ditches and checks, but are not embraced in the tract upon which the general system of checks is being undertaken. Within

the last-named tract nothing was done in time for a crop last season, but work has been vigorously pushed forward for the last year, both upon the main canal and upon branch ditches and checks, preparatory to the coming winter's seeding.

You have built upon this tract during the past year, besides the buildings upon the Poso ranch, twelve houses, barns, &c., for the use of tenants. These houses are two stories high and 18 by 35 feet on the ground, with a porch or verandah above and below, the entire length of one side. The barns are 30 by 45 feet, containing a granary and stalls for 20 horses below and hay-loft above. Each ranch is also provided with a well-pump and horse-power. The depth to which wells have to be bored varies from 80 to 110 feet. The entire cost of house, barn, well, &c., for each ranch is about \$2,000. The improvements on the Poso ranch (section 3, township 27, range 25 east) consist of a house and well the same as built for the tenants, barn 45 by 103 feet, with granaries and stall room for 40 animals, with the addition of sleeping quarters for men, kitchen, dining-room, and blacksmith shop, costing in the aggregate something over \$4,000. An artesian well is now being bored here, and has reached a depth of about 250 feet. No trials have heretofore been made in this district for artesian water, but as flowing wells have been obtained on Kern Island, to the southward, and at Tipton, only 30 miles north, it is hoped and believed that the experiment being made here will prove a success.

These ranches are now occupied by farmers who came mostly from Tulare County, but some, I believe, from Stanislaus and Merced, where they had sown crops last year and lost them by reason of the drought. The branch ditches running to and through their ranches have been built by them under contract, you furnishing implements and paying them 5 cents per cubic yard of earth. This has given employment to their otherwise idle teams and men, and though the price will strike most earthwork-contractors as extremely low, the material being so light, dry, and easily moved, they have not only earned good wages for their men and teams, but have made a profit which has enabled them to purchase additional stock for carrying on their ranches. They have from 200 to 700 acres each now checked and ready for cultivation, the average being about 350 acres, while on the Poso Ranch your own force has checked a little over 1,700 acres. It is hoped that the present acreage of about 6,000 may be increased to 10,000 or more in time for seeding during the coming winter. The work of ditch construction has been partially suspended, the stock being needed to put in the crop on the various ranches. I have, however, 30 head of stock still necessarily engaged in hauling lumber and supplies, and between 60 and 70 men, including carpenters, laborers, and teamsters, engaged in putting in weirs and gates, my pay-roll at present amounting to about \$120 per day.

From the above you will see that I cannot at present give you a final statement of the actual cost per acre, with a view to fixing a price at which these lands may be put upon the market; and I would suggest that your present system of leasing lands be continued until the works are carried far enough to determine this question more satisfactorily.

The tenants now occupying these lands pay you a rental of one-fourth the crop, for building the ditches and delivering the water to the land without cost to them, and advancing them the necessary supplies while preparing the ground and putting in their crops. If you can afford to continue these terms you will find no lack of tenants to cultivate your lands. It has in fact been intimated by some of your tenants that they, being men of small means, would rather and could better afford to lease lands upon these terms than to purchase it at the rate necessary to cover the expense of canals and ditches, with the liability of further expenses from time to time for keeping up repairs, enlarging and extending works as may become necessary in the future. While you, on the other hand, if you can afford to reclaim these lands at all, can better afford to retain the ownership until your plans are more fully developed than to dispose of a few small tracts, the separate ownership of which might impede such development by reason of a failure or refusal on the part of purchasers to co-operate with you.

Very respectfully submitted.

F. R. FILLEBROWN,  
Engineer Fourth District

POSO RANCH, November 25, 1879.

*Report of C. Brower, agent, and Walter James, engineer, of Irrigation District No. 1, Kern Valley, dated November 25, 1879.*

BAKERSFIELD, CAL., November 25, 1879.

Messrs. HAGGIN & CARR,  
San Francisco, Cal.:

GENTLEMEN: In compliance with your request for information concerning the availability of the lands of this district, and the condition, cost, and progress of its work of irrigation, we have respectfully to submit the following report:

The district is bounded on the north by Kern River and the bluffs which skirt the

with bank of that stream; on the east by the east line of range 28 east, Mount Diablo base and meridian of the United States survey, along or near which line the usually level surface of the valley breaks into the undulations of the foot-hills of the Chachapa Mountains; on the south by a line drawn east and west through the center of the basin known as Kern Lake; and on the west by that branch of Kern River known as "Old River," which leaves the former stream at a point near the center of section 26, in township 29 south, of range 27 east, and runs thence in a southwesterly direction to a slough connecting Kern with Buena Vista Lake.

The area of the district is, in round numbers, 120,000 acres. It comprises at once the most diversified body of agricultural lands in the valley, the most considerably improved, and the furthest advanced in the general system of irrigation works now in progress of construction throughout the valley, and, as well understood, wholly indispensable for vegetable productions of any description in this arid region almost destitute of rainfall.

The lands of this district may be divided into three general classes: 1st, the reclaimed swamp and overflowed lands of the "South Fork," numbering upwards of 20,000 acres, with their soil of dark loam thoroughly enriched with the vegetable decays of ages, upon which that invaluable forage-plant alfalfa thrives with unexampled luxuriance, and Indian corn and the various fruits of the temperate zone yield with surprising abundance; 2d, the gently elevated table-lands further east, whose slight admixture of gravel adapts them most completely to the cultivation of the raisin-grape, the almond, and the various semi-tropical productions; 3d, that body of lands, scarcely elevated above the reclaimed swamp-lands, and constituting the more extensive class of the lands of the valley, whose slight impregnation with silicious substances has proven them unsurpassed for the production of the cereals, as well as most excellently adapted to all the purposes of general agriculture.

The various irrigation works projected and essential for the supply of this vast district, though under process of construction since the year 1870, and prior thereto, are still far from complete. They may be hastily enumerated in their present condition as follows:

1. The "Kern Island Irrigating Canal," the oldest of the district and the most important by reason of its superior location at the highest point on the south bank of Kern River, has a width of 48½ feet in the clear at its head-gate in the northeast corner of section 17, township 29 south, of range 28 east, with a depth of channel of 4 feet and a length of 18 miles; of its branches the "Central," with a width of 20 feet on the bottom and a depth of 3 feet, running in a southerly direction and distant from one to two miles easterly from the main channel, is completed for a length of 8 miles. Its continuation has been projected for a further distance of 7 miles to Kern Lake. The town branch, for supply of the town of Bakersfield and the farming lands in its vicinity, is completed for a distance of 2 miles, with a width of 15 feet and depth of 2. The various distributing ditches connected with this canal and its branches have been treated mostly as burdens upon the lands which they severally supply, and are not borne on the books of the company; their aggregate length may be stated approximately at 35 miles.

Besides the branches above mentioned, a third branch of this canal has been projected, to pass easterly through the town of Sumner; on the highest practicable line, to the easterly boundary of the district; thence southerly, with an ultimate connection with Kern Lake at its eastern extremity; this branch to have a width of 40 feet and a general capacity sufficient to supply the table-lands before mentioned, numbering upwards of 30,000 acres.

The Kern Island Canal with its branches is calculated to supply all the lands lying east of range 27 east, as well as to supply through its several connections with the east branch of the "Stine Canal" such water as may be required by the latter, when available for the purpose.

2. The "Farmer's Irrigating Canal." Head-gate located in the northeast-quarter of section 24, township 29 south, range 27 east. Width 50 feet, and depth of channel 3 feet.

The length of the main channel is about 15 miles, consisting almost wholly of natural sloughs and water-courses, the principal of which is known as the "Panama Slough." It has 4 miles of branch constructions, varying from 10 to 20 feet in width, and about 30 miles of distributing ditches. The duty of this canal and its branches is the supply of numerous small farms and communities of farmers scattered through the eastern and central portion of townships 30 and 31 south, of range 27 east.

3. The "Stine Canal." Head-gate at the junction of Old River with Kern River. Width 80 feet, depth of channel 3 feet, and length 15 miles. This canal has an aggregate of 32.30 miles of branches, varying in width from 12 to 20 feet, and 41½ miles of distributing ditches. It shares with the Farmer's Canal the duty of irrigating the two townships last mentioned, besides supplying the easterly tier of sections in townships 31 and 32 south, of range 26 east, and other lands in the southern portion of the district.

4. The "Castro Ditch." Head-gate adjoining that of the Stine Canal, on the east.

Width 16 feet, depth of channel 2 feet, length about 5 miles. This ditch is intended for a limited field of irrigation in the northeasterly portion of township 30 south, of range 27 east.

5. The "Panama Ditch." Width of head-gate, in section 14, township 30 south, range 27 east, 10 feet; depth of channel 2 feet; length of ditch proper and its branches 1 mile. This ditch derives its water supply through the "Panama Slough," in common with the Farmer's Canal. Its field of irrigation is so blended with that of the latter as to be inseparable therefrom.

6. "South Fork." Head-gate in northeast quarter of section 17, township 29 south, of range 28 east. Width 26 feet, depth of channel 2 feet, and length about 3 miles. The distributing ditches connected with this channel have an aggregate length of about 7 miles, and are used for irrigating lands in the immediate vicinity of Bakerfield. The main channel is also used at times for the purpose of increasing the supply of the Kern Island Canal.

Besides the canals and ditches above described may be mentioned five flowing artesian wells, located upon your lands at various points through the district, with depth ranging from 250 to 400 feet, and discharging from 3,000 to 10,000 gallons each per hour. Several additional wells are now under contract, and it is believed that the irrigation of the lands of the district may be greatly promoted through this means at a comparatively reasonable cost. The wells heretofore constructed have cost an average of about \$2,500 each; but present contracts for boring are being let at the rate of \$1,600 per well, with guaranty of flow.

These canals and ditches having been the offspring of necessity, and constructed without exception, by associations of farmers and owners of land for the purpose of rendering their lands habitable and possible of cultivation, rather than with any chimerical view to speculation in sales of water, the system has necessarily been hastened over a widely extended area at the expense of thoroughness of construction, and the channels are generally not opened to a capacity which the future will certainly require, nor provided with the necessary works for controlling their current and preventing erosion. It will be impossible, therefore, at the present time, to present such a showing of the cost of the irrigation works of the district, even so far as now constructed and in use, as would enable you to apportion the cost among the lands of the district with any degree of uniformity for the purpose of establishing a selling price per acre. A most important objection, furthermore, to the offer of these lands before completion of the general system of irrigation works in its main features, at least with such changes in the general plan as may be found necessary from time to time as the work progresses, would suggest itself in the opening which such course would offer to a wearisome line of obstacles and annoyances through the contumacy or cupidity of individual land-owners of small interest who might stand in your way. It will be remembered in your experiences of the past that many such impediments have been met with, and removed only through the purchase of obstructing lands at exorbitant price.

We would earnestly recommend that before such action be taken the irrigation system of the district be so completed as to place all of your lands with reasonable access to the water necessary for their irrigation, that the total cost of the works thus completed be apportioned *pro rata* among the benefited lands of the district, and that this apportionment be added to the intrinsic value of the lands, to determine the price per acre at which they may be offered in tracts, together with permanent interests in the water-course by which they are severally irrigated. In our judgment this point may be arrived at during the coming year, and in the mean time we would recommend that, if not too burdensome to you, the present favorable terms of lease of these lands be extended for another year.

The marked success of your tenants during the past season has attracted toward these lands the attention of many persons who would without doubt become purchasers when the lands are finally placed upon market, but having no opportunity for remaining in the vicinity, their attention would probably be turned in other directions. Besides, many excellent men and families driven from other portions of the State and the States at our North, through the prevailing drought and absence of facilities for irrigation in our interior valleys on the one hand, and the destructive results of excessive rainfall on the other, are finding their way hither, and as they will form valuable accessions to our community as well as future purchasers of lands, it would seem politic to extend such aid as might enable them to recover from former embarrassments and gain a footing in our valley.

There are in present existence on your lands, at various points throughout the district, fifteen leases of class I, the tracts varying from one to three sections each. These tracts are each provided with a good two-story dwelling, large and commodious barn, granary, repair shop, and well. Lumber for fencing is also furnished free of charge, and such fruit-trees and vines as may be required for use of the occupant. The improvements of these tracts have been made at a cost of from \$2,500 to \$1,000 per tract.

There are also thirteen leases of class II, in tracts of from 320 to 640 acres; the improvements in this class consisting of a good one-story dwelling of five rooms, a barn with stable room for 16 horses, and a well in each instance; costing in the aggregate from \$1,500 to \$2,000 per tract. Lumber for fencing, trees, and vines are also furnished this class as in class I. These leases run for a period of five years, and their terms are rent and water free during the first year, and, thereafter, one quarter of the crop for each of the succeeding four years. When necessary and desired by lessees, provisions, seed, feed, and implements are advanced to them during the first year, to be repaid at their convenience during the term of the lease. Additional aid is extended in the offer to purchase their crops at the market rate if they prefer to thus dispose of them.

These operations have given an unmistakable impetus to the development of the country, outside of your own improvements, as may be observed through the various buildings springing up in the district, noticeable among which are the fine residences of J. C. Crocker, esq., recently completed, and the equally imposing edifice of his brother, E. M. Crocker, approaching completion. These gentlemen are among our leading citizens. They own some of the finest farming lands of the district, and propose to make it their permanent home.

As before stated, the cost of the irrigation works of the district cannot be presented at present with completeness sufficient for your purpose, but for your general information such figures as we have are herewith presented, more or less accurate and in detail, according to the control or supervision which your agents have been able to exercise over the system of accounts and affairs of the various channels in which you have interests, to wit:

KERN ISLAND IRRIGATING CANAL.

Statement of cost of construction, repairs, &c., to November 20, 1879.

	Construction.	Repairs.
KERN RIVER DAM		
(In southwest corner section 9, township 20 south, range 28 east.)		
June 15, 1875, to October 25, 1875:		
Labor and team-work (including subsistence, feed, &c.).....	\$6,215 75	
Expenses (pro-rata services, W. H. Conther).....	759 65	
	<hr/>	\$6,975 40
Reconstruction, improvements, repairs, &c.:

Total Kern Island Irrigating Canal.....		\$173,031 53

FARMERS' IRRIGATING CANAL.

Repairs.

Your interest in this canal being limited, and its administration being in the hands of an association of the farmers whose lands it waters, the accounts of the company have not been kept in manner to enable us to present the cost of works in detail, nor can the necessary classification be now obtained. The cost of construction and repairs in gross is furnished as follows:

Expenditure upon main line.....	\$16,095 00	
Expenditures upon branches .....	2,737 00	
		\$18,832 00

STINE CANAL.

The early financial history of this canal is involved in more or less obscurity. It is now under supervision of your agents, however, and the expenditures upon it, so far as obtainable, are as follows:

Construction and repairs of main line .....	\$44,218 48	
Construction and repairs of branch No. 1.....	16,886 97	
Construction and repairs of branch No. 2....	12,737 54	
Construction and repairs of distributaries.....	12,028 57	
Construction in connection with Kern Island Irrigating Canal No. 1 .....	537 01	
Construction in connection with Kern Island Irrigating Canal No. 2 .....	836 89	
		87,245 46

CASTRO DITCH.

A private ditch, the construction and repairs on which have been provided by contributions without formality of accurate accounts.

The cost is stated to be about .....	2,000 00
--------------------------------------	----------

PANAMA DITCH.

The remarks above made in connection with the Farmers' Canal will in a measure apply to this ditch. Its construction and repairs have been prosecuted with such irregularity of form and accounting that an approximation merely of the cost can be given, which is stated at about..	6,400 00
---	----------

SOUTH FORK.

Until within a recent period no permanent accounts have been kept of the expenditures on this channel beyond those made by the Kern Island Canal for its own requirements. The additional expenditures, including cost of head works, is probably not to be stated at less than .....	3,000 00
---	----------

Grand total.....	295,509 29
------------------	------------

As shown before, the above figures are not strictly reliable. They present, moreover, a very inadequate idea at best of the expenditures already incurred in the district for the reason that scores of miles of branch canals and distributing ditches now attached to the various lands have been made by private individual and joint companies, without preservation of the accounts or memoranda of their costs. These works assuredly should be considered a charge against the lands of the district in the final apportionment, and we see no method of arriving at a just estimate of their cost except through computation based upon actual survey. These additions, it may be contended, will so augment the grand result as to burden the lands to the point of discouraging purchasers; but it will be remembered that the body of lands to be benefited is coextensive with the vast acreage of the district itself, which, by reason of its general uniformity of surface, contains practically no non-irrigable lands (to coin a word), and should an addition of even 50 per cent. upon the aggregate cost as above be reached with the final completion of the works the rate per acre would still prove insignificant in comparison with the value of the water rights attached to the land and the permanent advantages attending.

Regretting our inability to report at this stage a degree of advancement in the irrigation works of the district sufficient for your purposes, but trusting that under the present very satisfactory rate of progress such point may be reached at an early day,

We are, very respectfully, your obedient servants,  
C. BROWER, Agent.  
WALTER JAMES, Engineer.

*Report of W. H. Macmurdo, engineer of Irrigation Districts Nos. 2 and 3, dated November 25, 1879.*

Messrs. HAGGIN & CARR, San Francisco :

GENTLEMEN : I herewith hand you a brief report of the results and effects of irrigation as carried out in district No. 2 for the past four years.

*District No. 2* comprises all lands west of Old Kern River, south of New Kern River and north and west of Buena Vista Slough, being portions of townships 29, 30, 31, and 32 south, range 25, 26, and 27 east of Mount Diablo base and meridian, and containing an aggregate area of 52,000 acres.

The general slope of the district is from northeast to southwest, with an average fall of seven feet per mile. The land is much diversified as regards the character of the soil. In the northern portion of the district the soil is composed of alternating strata of varying thickness of sand and alluvial deposits, containing but little clay in its composition until we approach the central portion of the district. Here the soil becomes more clayey in its composition, and so increases as we go south, until, on the southern portion of the district, we find the soil to be a stiff adobe.

The district is supplied with water for irrigation purposes by the following principal canals and their branches:

*The Anderson Canal*.—Commencing in Kern River, near the center of section 33, township 29, range 27, Mount Diablo base and meridian, and running thence in a southerly westerly direction about 4 miles, being 15 feet wide, 2½ feet deep, and having a discharging capacity of 75 cubic feet per second. This canal flows into Belle View ranch, which occupies the northern portion of the district, and is used exclusively for irrigating that ranch. The canal was in a state of construction when it first came under my supervision, and has not been completed at the present time, owing to the impossibility of obtaining many accounts against the canal. I am unable to state the actual cost of construction. The same facts exist in regard to several of the canals named below.

*The Gates Canal*.—Commencing in Kern River near the west boundary line of section 26, township 29 south, range 27 east, Mount Diablo base and meridian, and running thence in a southwesterly direction about 2½ miles, being 12 feet wide and 2½ feet deep, and having a discharging capacity of 48 cubic feet per second. This canal also flows into Belle View ranch, and is used exclusively for the irrigation of that ranch.

*The Buena Vista Canal*.—Commencing in Kern River near the east boundary line of section 33, township 29, range 27, Mount Diablo base and meridian, and running thence in a southwesterly direction 13½ miles, 30 feet wide and 3 feet deep, and having a discharging capacity of 216 cubic feet per second. This canal flows through the Belle View ranch and the greater part of district No. 2, and is owned by yourselves and many farmers who own land in their own right in the southern and central portion of this district. The capital stock is divided into 2,600 shares. Of these 2,600 shares 1,000 belong to the individual farmers who possess farms in the district. These farmers have constructed numerous branch ditches of various widths and dimensions from the main canal to their lands, and are using the water on their lands with good results.

Of the amount of branch ditching, &c., done by these parties and cost of constructing such works I am unable to make any definite statement at present. The cost of constructing the main canal and head-gates and weirs and keeping the canal in good repair and condition to date is \$26,125.36.

*The James Canal*.—Commencing in Kern River near the east boundary line of section 33, township 29, range 27, Mount Diablo base and meridian, and running thence in a southwesterly direction 17½ miles, 60 feet wide the first three miles and 40 feet wide the remaining distance, being 3 feet deep, and having a discharging capacity of 34 cubic feet per second. This canal flows through the Belle View ranch, and is used furnishing an abundant supply of water for the irrigation of this ranch, it supplies water to the greater portion of the southwestern part of district No. 2, and is owned exclusively by yourselves. From the books and accounts of the secretary I find that \$16,600 have been expended in the construction of this canal. This does not include the cost of lumber for weirs, &c., and is below the actual cost of construction.

*The Plunkett Canal*.—Commencing in Kern River near the center of section 33, township 29, range 27, Mount Diablo meridian, and running thence in a southwesterly direction through Belle View ranch, being 3½ miles long, 12 feet wide and 3½ feet deep, and having a discharging capacity of 45 cubic feet per second. The water from this canal is used and belongs exclusively to Belle View ranch.

*The Meacham Canal*.—Commencing in Kern River near the northwest corner of section 6, township 30, range 27, and flowing thence through the Belle View ranch in a southwesterly direction nearly 4 miles, 12 feet wide and 3 feet deep, having a discharging capacity of 48 cubic feet per second.

*The Wilson Canal*.—Commencing at a point near the head-gate of the Meacham Canal on section 6, township 30, range 27, and flowing through Belle View ranch.

niles in a southwesterly direction, 5 feet wide and  $2\frac{1}{2}$  feet deep, having a discharging capacity of 18 cubic feet per second.

The last two canals named above belong exclusively to parties owning land west of Belle View ranch, and are used to irrigate lands now being farmed by themselves.

I am unable to make any statement of the cost of these canals nor the amount of ranch ditches constructed by them.

*The Henley Canal.*—Commencing on the northeast quarter of the southeast quarter of the southeast quarter of section 9, township 30, range 26, running thence in a southwesterly direction about  $2\frac{1}{2}$  miles, 3 feet wide, 2 feet deep, and having a discharging capacity of 10 cubic feet per second.

*The Frazier Canal.*—Commencing in Kern River on northeast quarter of section 16, township 30, range 26, and running thence in a southwesterly direction about  $2\frac{1}{2}$  miles, 3 feet wide,  $1\frac{1}{2}$  feet deep, and having a discharging capacity of 18 cubic feet per second.

*Weirs.*—On section 33, township 29, range 27, near to and below the head-gates of the Buena Vista Canal and the James Canal a weir 150 feet wide and 20 feet long has been constructed with arrangements so constructed that the water in Kern River can be forced into these canals, and the sand which has a tendency to deposit in front of the head-gates can be sluiced out and allowed to pass down the river instead of flowing into the canals at a cost of \$1,600.

On section 1, township 30 south, range 26 east, a combined weir and bridge, 400 feet in length, and 24 feet in width, has been built at a cost of \$7,000, and serves the same purpose of the one just described. Both of these weirs are so constructed that the whole interior parts can be removed at short notice, and allow the water to flow in its usual channel without obstruction. A plan of the above described works can be seen and their object better understood by examining the plat of Belle View ranch inclosed with this report. A plan of the weirs used in the principal irrigating canals can be seen and understood by glancing at the plat of the McClung ranch accompanying my report on district No. 3, and marked "A plan of weirs in the Pioneer Canal." Such a weir costs about \$75.

It will be seen by the foregoing description of the principal canal that their total length is about 51 miles; their aggregate discharging capacity 832 cubic feet per second. This amount of water if evenly distributed over the whole district would be sufficient to cover the district, 52,000 acres, 20 inches deep in  $1,268\frac{1}{2}$  hours, about 53 days, which would in effect be equal to 20 inches of rainfall. But it has been fully demonstrated from experience and practice that to insure a crop of small grain on any part of the northern portion of this district (No. 2), 30 inches of water in depth is necessary the first year, as the hard-pan or clay strata are so far beneath the surface that the water sinks down and drains off toward the lakes.

Owing to the depth of the substrata, it has been found most expedient to irrigate the northern portion of district No. 2, especially the tract known as the Belle View ranch, and occupying the whole northern part of this district (and so shown on the general map of Kern County), to run the water over the surface by means of numerous small ditches, and not by means of the system adopted in district No. 4, where the hard-pan is only a few feet below the surface, and consequently holds the moisture near the top.

This system of irrigation, by means of small ditches, has been found very expensive, as it requires the constant attention of many hands, but it has some advantage over the method of irrigating district No. 4.

1. *In regard to economy of water.*—Water can be caused to flow over the lands in this part of the district, wetting the ground a foot or more in depth, whereas if checks were constructed, as in district No. 4, it would require a much longer time to fill the checks and consequently would require a much larger amount of water, as it would soak or sink in the ground in proportion to the time occupied in filling, and all water sinking below a certain depth is, in great measure, lost.

2. *Economy of cultivation.*—The northern portion of the district is very uneven and rolling and would necessitate the construction of checks so near together that they would materially interfere with the economical working of the land.

3. *Injury to crops.*—The land being uneven and rolling, the high portion of the field would soon drain off and become dry, while the low places would become too wet, thereby producing rust and diminishing the yield of the crop.

It has been found by practice that it is best to run water over the higher parts of a field and allow the low places to irrigate from seepage, as far as possible, thus obtaining a better result and materially reducing the average cost per acre of irrigation.

In the year 1875 water could be reached at a depth of from 8 to 12 feet below the surface of any part of the Belle View ranch; instead of rising nearer the surface from effect of using such large quantities of water during the past four years, as would be naturally supposed, it has in fact changed but little. This is probably due to the fact that the underlying strata have a declination toward the lakes sufficient to drain the water from the northern portion of district No. 2.

I inclose a plat of Belle View ranch (occupying the northern part of this district).

Farming operations have been confined chiefly to this tract. The plat shows a large part of the land cultivated in this district, also the manner of distributing water by means of small ditches, and plans of head-gates and weirs.

The different kinds of crops are designated by means of colors, the principal crops being wheat, barley, and alfalfa, though many different kinds of crops have been cultivated with success.

Cotton and rice have been successfully grown, and preparations are now being made for the more extended cultivation of rice. Flax, tobacco, and other crops have done remarkably well. Oranges, lemons, and many semi-tropical fruits are in a flourishing condition. The grapes raised in this district cannot be surpassed by any section of the State. All the ordinary varieties of fruits are doing remarkably well.

The yield of all crops has been good, notwithstanding the unusual dry season, and a marked increase in the fertility of the soil has been the invariable result where irrigation has been carried on.

It will be seen by the plat that a large area is seeded in alfalfa. This crop requires but little water after the first year, the deep, loose soil of this district seeming particularly adapted to its wonderful growth, which has often reached the height of six feet in a few months. In soil of this description the roots of alfalfa reach down from 12 to 15 feet, and at this depth find sufficient moisture to support it through the driest seasons.

4 *Artesian wells*.—On the southern border of this district two flows of artesian water have been secured. On section 11, township 31, range 25, Mount Diablo meridian, at a depth of 385 feet a flow was obtained furnishing 3,000 gallons per hour. This well is cased from top to bottom with a double 8-inch iron pipe.

On section 17, township 31, range 26, a well similar in description, 295 feet deep, is flowing about the same amount of water per hour, has been obtained.

#### DISTRICT NO. 3.

*District No. 3* comprises all lands lying north and west of Kern River, north and east of swamp-land district No. 121, and south of Goose-Lake Slough, and including portions of townships 27, 28, 29, and 30 south, ranges 22, 23, 24, 25, and 26 east, Mount Diablo base and meridian, containing an aggregate area of 63,000 acres. The general slope of the district is from southeast to northwest, with an average fall of 2½ feet per mile.

District No. 3 is composed of several distinct qualities of soil, the eastern portions being similar in character to the northern portion of district No. 2, while the southern and western sections correspond with the description of the southern portion of district No. 2.

District No. 3 receives its supply of water for irrigation purposes from the following principal irrigating canals and their branches, viz:

*The Railroad Canal*.—Commencing in Kern River, near the southwest corner of section 31, township 29, range 27, Mount Diablo meridian, and flowing thence in a northerly westerly direction about 3,000 feet, at which point it discharges into Goose Lake Slough and flows to the extreme northwestern part of the district. This canal is 10 feet wide in the bottom, 2 feet deep, and has a discharging capacity of 160 cubic feet per second.

*The Wible Canal*.—Commencing at Kern River, near the northwest corner of section 6, township 30 south, range 27 east, and running thence in a northwesterly direction about 1,000 feet to the point of intersection with Goose Lake Canal, thence into the Goose Lake Canal to the point at which Goose Lake Canal discharges its waters into Goose Lake Slough, and from this point through the channel of Goose Lake Slough to the lands along the northern border of this district. The Wible Canal is 40 feet wide in the bottom, 2 feet deep, and has a discharging capacity of 222 cubic feet per second.

It is in possession of farmers owning land in the northern portion of the district who have constructed many branch ditches and checks, and has been successfully operated for the past three years. I am unable to state the cost of the main canal and branches, &c., as the work has been entirely executed by other parties.

*The Goose Lake Canal*.—Commencing in Kern River, near the northeast corner of section 1, township 30 south, range 26 east, Mount Diablo meridian, and running thence in a northwesterly direction about 4½ miles, at which point it discharges into the Goose Lake Slough, and flows thence in the channel of Goose Lake Slough along the northern border of the district, and is taken out at different points along the southern border in canals and ditches to irrigate lands in the central portions of the district. This canal has a bottom width of 140 feet, and a depth of 3 feet, with a discharging capacity of 1,050 cubic feet per second, and has been constructed at a cost of \$9,000.

*The Pioneer Canal*.—Commencing in Kern River, near the northeast corner of section 1, township 30 south, range 26 east, and running thence in a westerly direction about 1½ miles, and has a bottom width of 60 feet, with a discharging capacity of 450 cubic feet per second, and has cost to construct to its present capacity \$43,949.87.

ANAL

1/2 .

It is contemplated to complete this canal to the northwestern portion of this district, to irrigate the lands bordering on swamp-land district 121 and Goose Lake. It is now in successful operation through the eastern and central portion of the district from the point of diversion from Kern River on the east to section 13, township 30 south, range 24 east.

The Pioneer Canal is divided into 2,400 shares. Of the 2,400 shares 350 shares belong to parties owning land in this district, and the water represented by them is used for the successful cultivation of their farms. They have built branch ditches and checks from the main canal to their lands with good results.

This canal flows through the entire length of the McClung Ranch, and is used for the principal irrigation of that ranch. I inclose a plat of the McClung Ranch, showing the route of the main canal and the many branches, &c.

*The James and Dixon Canal.*—Commencing in Kern River, on section 3, township 30 south, range 25 east, and running thence in a westerly direction for about 3 miles, 30 feet wide and 3 feet deep, and having a discharging capacity of 240 cubic feet per second. It is used upon the McClung Ranch and the lands west of the McClung Ranch.

*The Johnson Canal.*—Commencing in Kern River, on section 6, township 30 south, range 26 east, and running thence in a southwesterly direction about 4 miles, 30 feet wide on the bottom, and 3 feet deep, having a discharging capacity of 240 cubic feet per second. The Johnson Canal is owned by several different parties who own small tracts of land in the southern portion of this district, and is operated and used exclusively by them.

*Ashe's Canal.*—Commences in Kern River, on section 3, township 30 south, range 26 east, and runs thence in a westerly direction about 1 mile, 8 feet wide, and 2 feet deep, having a discharging capacity of 24 cubic feet per second. It has been constructed and used by Mr. J. R. Ashe upon his farm upon section 10, township 30, range 26 east.

*May's Canal.*—Commences on section 18, township 30 south, range 26 east, and running thence in a westerly direction through sections 13, 14, and 15, township 30 south, range 25 east, 8 feet wide and 2 feet deep, having a discharging capacity of 36 cubic feet per second.

*The Joice Canal.*—Commencing in Kern River, on section 23, township 30 south, range 25 east, and running thence in a northwesterly direction about 4 miles, 12 feet wide and 2 feet deep, having a discharging capacity of 48 cubic feet per second. This canal was constructed with a view of irrigating the southern portion of district No. 3, especially the Buena Vista Ranch, which occupies nearly the entire southern portion of this district and has been in successful operation for the past five years.

By means of this canal, its branches and checks, the Buena Vista and adjoining ranches have been brought under cultivation at a comparatively small expense. From the annual report of the superintendent of the Buena Vista Ranch and accurate accounts of farmers owning adjoining lands, it has been ascertained that it only costs 10 cents per acre to irrigate land in this section of this district after constructing the ditches and checks.

It will be seen by the plat of the McClung Ranch that the same system of irrigating by small ditches has been adopted. This is owing to the same reasons given in my report on district No. 2.

The yield of all crops on the McClung Ranch has been good, and the soil shows the same evidence of increasing fertility from effects of irrigation.

Near the present terminus of the Pioneer Canal (and central part of this district) ranches have been laid out, houses, barns, and all necessary outbuildings have been built at an average cost and expense of about \$2,000 for each ranch. These ranches are leased to tenants on the most favorable terms.

The combined bridge and weir mentioned in my report on district No. 2 serves the purpose of controlling the water in the Railroad, Wible, Goose Lake, and Pioneer Canals.

This report is respectfully submitted for your approval, hoping that you will find the results and operations of the past four years will justify you in continuing the development of a larger territory that has for years remained a barren waste.

Very respectfully,

W. H. MACMURDO,  
Engineer of Second and Third Districts.

BELLE VIEW RANCH, November 25, 1879.

SAN FRANCISCO, October 10, 1879.

AUGUST E. GANTZ, United States deputy surveyor, made the following statement:

I have been connected with the surveying department of this State since 1872. I am by education and profession, however, an engineer, surveying being but a slight portion of that.

I will assume that, in consequence of the recommendation which you have made the rectangular system will hereafter form the principal way by which we get at quantities for the purpose of disposing of the lands. It may be done in conjunction with other more scientific methods, but anyway I will assume that the rectangular system remains. The question then arises how to carry it into effect. It can be done direct through Washington—done something similar to what is being done now by having surveyors-general, or persons intrusted with the same duties under different names. I will also assume that hereafter the surveyors-general, or whatever their name shall be, will be absolutely competent men—professional men, that besides knowing all about land entries, &c., could also if called upon make an accurate survey themselves. More than this, they ought not to be political appointments. If they are political appointments what is there to prevent the deputies from also being political appointments. There is the root of the evil. Leaving the surveyors-general themselves out of the question, somebody must be a professional man. If the surveyor-general is not, then the deputy has got to be a professional man. At present, under the present system, the system works absolutely in the direction of swindling and corruption. If it had been invented for that purpose it could not have been invented better. To-day Mr. Jones wants a contract. Mr. Jones says he is a surveyor. Mr. Jones don't know the surveyor-general, but he knows some prominent politician who gives him a letter to the surveyor-general. He is required to step up to the chief draughtsman, who asks him a few questions, but before these questions are asked he is informed that a prominent politician has recommended him, and these few questions are a farce and do not amount to a row of pins, are probably entirely immaterial and do not go to the gist of the thing at all, and the gentleman comes down again and the surveyor-general is informed that he has been examined. I have undergone such an examination myself and know what it is, and that examination I had to undergo when it was intended to throw me out, and so it was severer than usual. This man takes the contract. He takes it at the present ridiculously low rates. The present rates and present requirements are entirely out of proportion. The present rates are not within 100 per cent. of what is required to carry out the laws properly. Anybody who takes a contract at the present rates does so knowing that he cannot carry out the laws. It is so understood, and when he comes back from the field it is so understood, and they say, "He has done the best he can."

This man is supposed to carry out the work "in his own proper person." These words were put into the contracts because heretofore contracts were absorbed by one or two men, and they "subbed" it out among half a dozen different parties, and the work was done loosely and it was not good work; and yet no deputy is supposed to have more than he can do personally within one season. The system is improved in that respect theoretically. You will find that the deputy who don't understand anything about his work during the first or second year gets some other deputy to come and help him, and that other man who does the work does not appear at all. The deputy getting the contract hires a man to do the work. He gets a competent man. In this particular respect I know it is being constantly done. I have not done it, but I have always felt that I worked at a disadvantage. There has been an inclination to be lenient in that respect, and so that as long as a deputy was in the field himself with a party and directed the work, even if the instrumental work was done by another man under his direction, that constituted what the contract calls "in his own proper person." It has been so construed by the present surveyor-general. I have always held that it was too lenient a construction. In fact, I have gone so far as to ask the Attorney-General of the United States, and he was, of course, not entitled to give me an answer that might afterwards come back to him for adjudication, but the construction of the surveyor-general is that as the work was done under their direction that was sufficient. I think that is a wrong construction. That direction requires continuous presence in the field; but I hold that there was no possibility of any proof being adduced of such continuous presence in the field, and those who construe the contracts in that way have a vast advantage over those who did their own instrumental work. Some cases in point are surveys made in the vicinity of Colorado River. I know positively that these surveys were made by parties that were in charge of compass-men only. I spoke of the case, and inquiries developed the fact that these compass-men had been employed only part of the time, and then under the supervision of the deputy. I then tried to prove that these compass-men had been in the continuous employ of the deputy for three years; but that proof was not called for, so I have never given it.

Heretofore a great evil was the collusion between the surveyor-general and the deputies. In the case of Mr. Hardenburg, the Dyers were the well-known men through whom the work was done. Then after Mr. Hardenburg was dismissed Mr. Stratton was appointed and the same "color in blue" continued. The name was changed but the appropriation was again absorbed by certain men. These certain men manage to continue, and exist to this day. They continued in lesser degree through the administration of Lawrence and Ames, and when the present surveyor came in he found

the present state of affairs. He found that these deputies were accused of being members of a ring. Mr. Wagner's appointment was a vast step in advance.

As a remedy for all this I would suggest a positive examination by competent men. I would constitute a board of examination. I would not execute our work by the same method which the Coast Survey employ. We cannot afford it. I would not do that. The remedy is competent men and tenure of office.

Establish a corps of engineers under the surveyor-general. First make him as competent as possible, then have your competent men under him; give them a fixed salary and have them gentlemen.

As far as technical matters are concerned we are behind. The present surveyor-general is no doubt 100 per cent. better than anything we have had for a long time, but the very system under which he exists, the source from which he derives ultimately his power, that is, the appropriation of Congress, everything joins to bring him back again in the same old grooves, the same old ruts. He is constantly beset by the same old political associates. In this case I have reason to believe that the surveyor-general was selected because Mr. Schurz thought him the best man for the place, and not upon the recommendations of any political friends, and I am satisfied that the work is largely better than it was done before for a long time. The "confirmation business" operates in this way, that they consider themselves under obligations to those who do not oppose their confirmation. There was opposition expected to Mr. Wagner's confirmation—a good deal of it.

If there is any way by which at least the subordinates of the surveyor-general could be selected with reference first and foremost to their competency and without reference to their greater or lesser political influence, there should be some way by which every competent man who has no political influence might be selected as a deputy.

Sometime ago the surveyor-general received permission to pay for employes out of the subdeposit fund, and an additional amount of bond, I think \$125,000, was required. Now, Mr. Wagner is comparatively an unknown man in San Francisco, and he had trouble to get that bond. The principal rich men in San Francisco are not his friends, so the present chief clerk busied himself in running about getting the bond for him. And now, to show the inconsistency of the thing, Mr. Wagner told me shortly after we had that conversation in which he said he was going to get along without a chief clerk, in speaking of Mr. Rickard, "He has not invented gunpowder, nevertheless he is an honest fellow." But the pressure of the friends who had furnished the bonds was great enough, notwithstanding that he thought he was not very bright, and notwithstanding that he had told me he would have no chief clerk—that the law did not know of any such position as chief clerk—notwithstanding all this, there was pressure enough to compel him or induce him to appoint that gentleman chief clerk. There were two contradictory statements for you.

Mr. Wagner abolished the abominable corruption of "extra work." Now, when there is extra work done the amount is paid into the Treasury, and the draughtsmen paid out of that. I do not know whether that is done now, but certainly Mr. Wagner started in with the best endeavors and intentions.

Q. If the surveyor-general should order the work to be done in the ordinary office hours, it would be done, would it not?—A. It is hard to tell. The clerical force is insufficient; but if a person comes in there and offers to pay for that extra work, it is done quick. That money ought to be paid into the Treasury, and then the draughtsmen paid out of it.

Q. Are not any of the draughtsmen now authorized to do work out of office hours, and take the money themselves?—A. No. That was the old rule. If it were not liable to such abuse it would be proper, but you cannot control it. It results in irregular work, and work being done without being paid for. The extra-work charge was abolished by Mr. Wagner, or properly I should say it was abolished, for in fact I do not know whether it is. There is another thing. If you wish to insure prompt work, you ought to pay them promptly. Prompt payment insures prompt work.

Q. Is the office kept open after office hours?—A. Not to my knowledge is the office kept open after office hours, and nobody, to my knowledge, is worked after office hours. If anybody, without the knowledge of the surveyor-general, does work—extra work—and takes pay from individuals, he is now doing it in office hours; he has no right to take work home. Men want to have a motive for working—they want their pay—I speak of the ordinary salaries of the office. In the first place, the salaries are paid quarterly; then the vouchers go to Washington, and then from one place to another until they get into the Treasury Department. I know of cases where salaries are not paid until six months after they are due—even a year after they are due—in my case, for instance. I have worked during the months of August and September, and have been engaged in surveying ranges at a per diem, and the expenses would not be covered by mileage at all. The necessary and actual expenses come out of my pocket, in the first place, and are afterwards refunded. I worked in August and September. I have rendered my account and I expect to have the money for this work in about three months, not for my services, but money that I have actually advanced to the govern-

ment. Our contract states also that we are not allowed to do any private work within the territory covered by our contracts. Now, as far as I myself am concerned, I have steadily refused to take contracts. I have taken no contracts; but this provision is daily, hourly, constantly violated, and lands are picked out—townships are selected with that very purpose in view—to get those townships where the most private work is to be done. Of course, when a gentleman tells you, as he did to-day, that the work cannot be done at the present rates, and after he tells you the work cannot be bestly done—under the rates, it is impossible to do it, and he knows before taking the contract that he cannot do it for you—his reason for taking the contract must be the opportunities for private work, and that he intends to get the money without doing the work.

Q. 13. Is it a fact that more or less contracts are let to men who hire men to go into the field and never themselves leave this city?—A. It is a matter of fact that there exists to-day in this city a force that acts as middlemen between the deputy surveyors and the men in the field. Benson & Co. have a little manufactory of field-notes. They have rubber stamps cut out for each set topographic phrase. The business of that office is the making out of field-notes for parties in the field. It may be done to expedite business. The thing is possible. J. A. Benson is known to be a very good man. I taught him what he knows about the business in 1872. He is known to be on good terms with everybody, and there is a league in Washington, because Mr. Benson is informed from Washington before anybody else here. I will cite a case. This gentleman is known to be on good terms with everybody. Now, if an inexperienced man gets into any dilemma he gets a little hint from somebody that the best thing he can do is to go to Benson's and he is all right. He makes his survey. If he can't get along, he sends for one of that firm to help him (as has been done), and the gentleman then makes out the field-notes and charges so much per township. This man has a direct interest in having as many incompetent men appointed as deputies as possible, because competent men can do their own work just as expeditiously as he can. My field-notes when I come home are ready to be copied, but I use abbreviations and I write hastily. I perhaps cannot lay my book flat, it looks bad, and in such a case I am the last man to copy them.

Q. If a survey was made in Shasta you do not send a man from here, do you?—A. Yes; sometimes they do that. Now, there has been somebody behind the throne. I have been approached within the last few months and asked to "let up." We are now working 100 per cent. better than we ever did; but there is still a great deal of improvement possible, and the principal improvement is competent men, tenure of office, and pay them decently.

Q. Suppose a contract is given a man in Shasta County, how can a man be sent away from here and in the face of the incompetent pay hope to make anything?—A. He can't under ordinary business rules. There is no money in it if he has been sent on such work as I have been sent. I do not know how they do it. There are cases where men are appointed in Shasta County. He sends his bond down here as required and makes his survey. I do not understand how a man can intrust his field-notes to another to rewrite. If he sends these notes down here and they come into the surveyor-general's possession and these notes are found incorrect they are not returned to this man, but they are simply returned to Mr. Benson for correction, and he changes and corrects them. But still Mr. Wagner is 50 per cent. better than we have ever yet had the office.

This manufactory of field-notes has existed for a long time; I do not know just how long; I think about five years. Before that was established they made up their own field-notes; or possibly he was successor to some other person. Before Mr. Benson became the chief man it was necessary to be on the right side of Mr. Dyer.

If the surveyor-general should be ordered to have so many men as their assistants at such and such a salary, these men to be strictly examined and not to be men who acted as chain-carriers for six months and then come and call themselves engineers; if it was necessary that every deputy surveyor should be capable of making a decent map of his own work, and a tolerably well educated man, then you would have better work, provided you pay them when the work is done.

I was out with Mr. Hobbs in the winter among the timber depredations, and they pay for that lagged for five or six months after it became due, and so it has been right straight along. The trouble is that most deputies are in the hands of brokers and pay 2½ per cent. for their pay. You will find that one-half of the vouchers are accompanied by a power of attorney. For instance, I have executed my contract, I have paid all my expenses, and I return my work, and it is proved there is due me \$7,000. I have expended all I have, and I know I cannot get a cent for six or eight months; the consequence is that I have to go to some broker, give him power of attorney to draw the check. He then advances me perhaps \$1,000 or \$2,000 to pay me my own money, and to live myself I have to pay him from 1½ to 2½ per cent. per month until that draft arrives. When it arrives the broker takes out what belongs to him, with the interest, and then passes me the rest.

There is one principal broker here, a man by the name of Greenbaum. Benson is doing a great deal of it himself.

If people will freely tell you their experience you can see the facts themselves and draw your own conclusions. No matter what system you recommend, the proof of the pudding will remain in the eating of it, and it will depend upon how it is carried out.

When a contract is awarded there is no way of testing his instruments. That is a great trouble. The government should certainly in the first place insist upon the best instruments known. The deputy surveyors furnish their own instruments, and they are not tested at all. There should be a standard instrument at each office. He never even brings in his chain to be tested. I do not think they have a standard chain in the office. The only way to test the chains is to compare them with a steel tape. There is supervision over the instruments that are used. We are instructed to use solar instruments. All of the deputy surveyors are provided Nautical Almanacs, but when they do not use the solar instruments they do not have the Nautical Almanac. I know of a man swearing that he ran a transit line, and it was a west line, but he did not look at his needle. I heard that same man testify that a needle line that was run several years ago could be run again. The instructions require that we should use a solar transit or solar compass. I may be mistaken about that, but such is my impression.

We have an immense mass of deputies, out of which I would not employ one hundred and fifty of them. Mr. Van Light cannot be induced to take a contract. Alfred Carver cannot be induced to have a contract. I have not taken any contracts for a long time. The only contract I have taken was the surveying of a range, and at \$15 per mile I lost \$350 on it.

Q. To whom do the field-notes go, and what proof has that officer of the correctness of the survey?—A. Field-notes go first to the chief draughtsman, and he has no other proof of their correctness than the mathematical correctness on the face of the paper, and the survey, too, is proof. You often find that surveys are correct on paper, but in resurveying the whole or parts you find the undoubted proof that something has been covered up, and I have known instances where not a single solitary line agreed with the field-notes. The examination of the chief clerk passes the survey, and for proof he has nothing but the mathematics upon the papers, and upon which to give his decision. So if anybody sat down in this city and made the mathematics agree this survey would be approved. The only thing that would prove anything is not done, and that is a quiet examination of the work in the field. There is a mode provided for inspection in the field, and the statutes provide for it, I believe, but you cannot appoint an agent unless there is money to carry it into effect.

Q. How many draughtsmen are employed in the land office here?—A. Out of the regular appropriation there are only three draughtsmen employed; the remainder are employed out of these special deposits. The regular draughtsmen vary from two to five or seven. The average amount of special deposit varies very much. There has been a great deal of trouble about the special deposits. It seems that the predecessors of Mr. Wagner went it blind, and the special deposits were exhausted before the mining claims for which deposits have been made were worked up.

## INDEX TO THE TESTIMONY.

- Allardt, G. F., California.  
*Débris* from mines, hydraulic mining, 15.
- Archibald, Albert W., Colorado.  
Pasturage homesteads, timber and agricultural land, pasturage lands, surveys, classification, 243, 244.
- Arms, H. N., Colorado.  
Pasturage homesteads, pasturage lands, stock-raising, 244, 245.
- Armstrong, N., Montana.  
Mining, and local mining laws, 340. Artesian wells, 43, 82, 84, 106, 120, 248, 431, 459, 493, 515.
- Ashburner, William, California.  
Timber lands, destruction of timber, irrigable lands, irrigation, water rights, 13, 14.  
Pasturage lands, mineral lands, subterranean rights, 14. Hydraulic mining and *débris*, 15.
- Atkinson, H. M., surveyor-general, New Mexico.

Lewis, William J., California.

Timber, irrigable and pasturage lands, water rights, surveys, *débris* from mines, 100-102.

LODE CLAIMS—Daniel Bacon, 329; T. C. Bailey, 481; W. H. Beatty, 395; E. D. Bright, 577; M. T. Burgess, 487; L. S. Burnham, 632; W. N. Byers, 258; R. D. Callin, 412; E. R. Chase, 407; J. H. Chase, 332; J. C. Cooney, 619; W. M. Curtis, 39; C. W. Cross, 571; S. W. Downing, 552; E. Eldridge, 525; W. P. Emory, 351; L. A. Fenner, 354; G. B. Foote, 358; C. M. Foster, 470; Robert Gardiner, 57; William E. Hall, 633; Moses Hallett, 269; E. C. Hardy, 615; Edwin Harrison, 97; R. D. Harrison, 363; William Haydon, 321; Harry C. Hill, 280; M. M. Hill, 122; S. W. Hill, 279; J. M. Howe and R. J. Monroe, 597; I. E. James, 423; George W. Jones, 90; J. B. Low, 289; William Magee, 112; H. N. McGuire, 588; J. H. Martineau, 505; W. McDermott, 372; O. H. McKee, 123; W. McMullen, 451; George G. Merrick, 298; Henry Neikirk, 300; George A. Nourse, 143; G. H. Pradt, 46; R. W. Raymond, 643; H. N. Reed, 303; A. D. Rock, 416; Chas. M. Rolker, 461; W. H. Stevens, 306; Edward F. Taylor, 215; D. Van Lennep, 418; Thomas Waser, 229; John Wasson, 3; Stephen C. Wheeler, 233; B. C. Whitman, 41; E. B. Wilder, 521; L. J. Wrinkle, 431; Carl Wulstein, 316.

Low, J. B., Colorado.

Mining litigation, apex of a lode, 289, 290.

Local mineral laws, square locations, placer claims, lode claims, tunnel location—29.

Madden, Jerome, Southern Pacific Railroad Company, Sacramento, Cal.

Classification; disposition of timber lands and preservation of irrigable lands; irrigation; water rights; desert-land act; pasturage land within railroad grants; land grants in California; survey of Spanish grants, and mining law, 102-109.

Magee, William, California.

Mineral surveys and monuments; recording mineral claims; answers to printed interrogatories, 110-115.

McGuire, H. N., Dakota.

Defects in the workings of the public land laws; homesteads and pre-emption; desert-land act, timber-culture act, and mineral land laws; coal, pasturage, and timber lands; surveys; mining records; litigation; irrigation, agriculture, and land grants, 583-589.

Markley, John, California.

Spanish grants; restoration of lands held under the railroad reservations; rainfall; timber, coal, &c., 115, 116.

Martineau, James H., Utah.

Answers to printed interrogatories; agriculture, timber, lode and placer claims, 502-505.

Mason, Rowell H., surveyor general of the Territory of Montana.

Surveys; classification of lands; timber land; subterranean rights; mineral lands; forest fires; pasturage land; pasturage homestead; inspection of surveys; compensation; local mining laws; mineral surveys and records, 380, 381.

Mason, H. P., Utah.

Timber lands; destruction and protection of timber, 506.

May, William R., Utah.

Irrigation, water rights, 506, 507.

McBloome, W. H., New Mexico.

Surveys, 444.

McBride, John S., California.

Mineral lands; local laws; *débris* from mines; mining, 116, 117.

McCaskill, John, and others, Colorado.

Pasturage land; agriculture; stock; fencing; pasturage homestead; water rights, 291-293.

McClay, John, California.

Timber, destruction and preservation of; *debris* from mines, irrigation, mineral reservation, placer claims, 117, 118.

McCoy, Charles T., Dakota.

Agriculture and timber, 590, 591.

McDermott, Walter, Montana.

Answers to printed interrogatories, lode claims, 372, 373.

McDonald, John, California.

Timber lands, sale of, protection of; mineral lands, irrigation, disposal of irrigable and pasturage lands; lode claims, square location, hydraulic mining, surveys, and subterranean rights, 118-122.

McGillivray, James, California.

Lands injured from hydraulic mining; timber lands and disposition of; tailings from mines, flood of 1862, reservoirs, water rights, 122, 123.

McKee, O. H., California.

Mineral laws, present; square location, placer claims, contests, 123, 124.

REPAIR OF BUILDINGS AT FORTRESS MONROE.

LETTER

FROM

THE SECRETARY OF WAR,

TRANSMITTING

*Estimate for repair of buildings at Fortress Monroe, Va.*

FEBRUARY 26, 1880.—Referred to the Committee on Appropriations and ordered to be printed.

WAR DEPARTMENT, WASHINGTON CITY,  
*February 26, 1880.*

SIR: I have the honor to transmit to the House of Representatives by way of a communication from the Quartermaster-General of the Army showing the urgent necessity for repair of the old public buildings at Fortress Monroe, Virginia.

The repairs are estimated to cost \$22,450, and I recommend that an appropriation be made for the same.

ALEX. RAMSEY,  
*Secretary of War.*

To the SPEAKER  
*of the House of Representatives.*

OFFICE ASSISTANT QUARTERMASTER,  
*Fort Monroe, Va., February 24, 1880.*

the QUARTERMASTER-GENERAL, U. S. A.,  
*Washington, D. C.:*

GENERAL: I have the honor to report that extensive repairs are badly needed on the old public buildings at this post, some of them having been in use over fifty years, and the limited appropriation of the Quartermaster's Department being inadequate, I request that Congress may be asked to appropriate the money to make repairs as follows:

four (4) sets officers' quarters, old brick buildings.....	\$1,500
quarters of the commanding officer.....	900
painting four (4) sets captains' quarters.....	800
roll Hall, large building, officers' quarters, new porches, front and rear, new floors inside, throughout, painting and plastering.....	1,500
repairs of two old houses, officers' quarters—\$3,000 each.....	6,000

## REPAIR OF BUILDINGS AT FORTRESS MONROE.

Casemates, first front, six (6) sets officers' quarters, replastered, refloored, and woodwork painted—\$250 each set.....	\$1.50
Casemates second front, same as first, except that porches should be repaired.....	2.00
Casemates, third front, porches repaired and painted.....	60
To repair post ordnance storehouses, &c.....	4.00
Repairing and painting office and quarters of post quartermaster.....	50
Repair and removal of store-houses quartermaster's department.....	3.00
Total.....	22.50

Very respectfully, your obedient servant,

L. E. CAMPBELL,  
*Captain and A. Q. M., U. S. Army.*

HEADQUARTERS UNITED STATES ARTILLERY SCHOOL,  
*Fort Monroe, Va., February 24, 1880.*

Approved,

GEO. W. GETTY,  
*Bvt. Maj. Gen'l, U. S. A., Colonel 3d Artillery, Commanding.*

[Indorsement.]

QUARTERMASTER-GENERAL'S OFFICE,  
*Washington, February 25, 1880.*

Respectfully submitted to the honorable Secretary of War, recom-  
mending that this matter be brought to the attention of Congress.

M. C. MEIGS,  
*Quartermaster-General, Bvt. Maj. Gen'l, U. S. A.*

○

WISCONSIN RIVER.

LETTER

FROM

THE SECRETARY OF WAR,

TRANSMITTING

*A report on the improvement of the Wisconsin River.*

MARCH 3, 1880.—Referred to the Committee on Commerce and ordered to be printed.

WAR DEPARTMENT,  
*Washington City, February 28, 1880.*

The Secretary of War has the honor to transmit to the House of Representatives, in obedience to a resolution of that body of the 25th instant, copy of report of the Board of Engineers on the improvement of the Wisconsin River.

ALEX. RAMSEY,  
*Secretary of War.*

The SPEAKER  
*of the House of Representatives.*

OFFICE OF THE CHIEF OF ENGINEERS,  
*Washington, D. C., February 27, 1880.*

SIR: I have the honor to acknowledge the reference to this office of the resolution of the House of Representatives of the 25th instant—

That the Secretary of War be requested to furnish this House with a copy of a report, recently submitted to him by a Board of Engineers, in reference to the improvement of the Wisconsin River—

and to return the same with a copy of the report called for.

Very respectfully, your obedient servant,

H. G. WRIGHT,  
*Chief of Engineers, Brig. and Bvt. Maj. Gen., U. S. A.*

Hon. ALEXANDER RAMSEY,  
*Secretary of War.*

## IMPROVEMENT OF WISCONSIN RIVER.

OFFICE BOARD OF ENGINEERS FOR FORTIFICATIONS  
AND FOR RIVER AND HARBOR IMPROVEMENT, &c.,

*New York, November 24, 1879.*

**GENERAL:** By your letter of September 5, 1879, the subject of the improvement of the Wisconsin River was transferred to this board with directions for it to be guided by the instructions contained in your letter of January 9, 1879, assigning the subject to the Board of Engineers on the improvement of the low-water navigation of the Mississippi and Missouri rivers.

The improvement of the Wisconsin River was proposed with a view to making it navigable by the class of steamers that could pass through the Upper and Lower Fox, with which it is connected by a canal, and thus to open a steamboat transportation route from the Mississippi River to Lake Michigan.

The following is a brief history of this work of improvement by the United States Government.

Under the direction of General G. K. Warren a reconnoissance of the Wisconsin was made in 1866 by Major C. R. Suter, which showed that a thorough survey would be needed before plans and estimates for its improvement could be made. Accordingly such a survey was made. August–November, 1867, from Portage City to the Mississippi, and April 6, 1868, General Warren submitted a report expressing himself thus :

From the present state of our investigations, I am in favor of an improvement of the river by dams, jetties, revetments, &c., of brush and stone, in connection with dredging, in preference to a canal along the banks, or to locks and dams in the river

and he recommended an appropriation of \$50,000 "to test this method of improvement more fully than has yet been done."

In his annual report dated August 31, 1868, he submitted detailed estimates for the improvement of the river, as follows :

1. For improvement of the natural channel of the river, for 3 feet navigation, by means of a series of wing-dams and use of Long's scraper. Estimate of cost, \$42,000.

2. For 4 feet navigation by use of natural channel, old beds, and side canals, built around shallow portions of the river. Estimated cost, \$3,207,000.

3. For a canal with 5 feet navigation, the canal to be built along the valley alternating from one side to the other to keep on most advantageous ground, and using the most convenient places in the natural bed of the river for crossings. Estimate, \$4,164,000.

The first plan he considered practical to secure not more than 3 feet of water, but thought it questionable whether it would meet the requirements of the country from which its business would be derived.

The second plan he considered objectionable on account of liability of change in the river during floods, and of the large expenditures necessary to keep the locks in repair and to maintain the channel.

He gave his preference to the third plan on account of its comparative cheapness to construct and economical maintenance, and as affording reliable water communication.

In his annual report of September 20, 1869, he recommended that \$100,000 be appropriated to test the practicability of improving the navigation by wing-dams before finally resorting to the project of a canal ; but in November, 1875, five years after he was relieved from the

charge of this work, General Warren submitted a final report, in which he gave his opinion in the following words :

It seems to me, from what I have presented in this chapter, that no satisfactory improvement on the Wisconsin can be made by any system of contraction and rectification.

On the 1st of June, 1870, Col. J. N. Macomb was placed in charge of this improvement. The act of Congress of July 10, 1870, appropriated \$100,000 for the improvement of this river by such plan as might be recommended by the Chief of Engineers.

Col. D. C. Houston relieved Colonel Macomb of this work May 5, 1871. Soon after, he was called upon for a project for the expenditure of the appropriation of \$100,000, made by the act of July 10, 1870, which had become available. He was instructed to confer with General Warren, under whose direction a survey of the river had been made in 1867. After conference with General Warren, Colonel Houston submitted a project, dated June 10, 1871, for improving the channel at the points where the line of canal proposed by General Warren crossed the river. This canal plan contemplated that boats should pass from the canal into the river and again into the canal at the crossings. It was proposed to ascertain by trial whether the necessary depth could be produced and maintained for this purpose, and whether the natural channel of the river itself could be improved. Colonel Houston's project, which contemplated the contraction of the river by means of wing-dams of brush and stone, was approved June 12, 1871, and operations were at once commenced and continued during the season. The work done and results accomplished were reported December 28, 1871 (see Report of Chief of Engineers 1872, page 135). Owing to the difficulty encountered in procuring materials near the canal crossings, it became necessary to improve portions of the river so that boats could navigate it. There were built during the season 22 dams at the upper and middle canal crossings, with an aggregate length of 6,621 feet, and at a total cost of \$31,890. The total length of river over which these works extended was about 7 miles. Their effect was to deepen the channel so that the boats used for transporting materials could navigate these portions of the river. Colonel Houston was satisfied from the season's work that the channel of the river could be improved to a depth of 4 feet, and in all probability 5 feet, and he so stated in his annual report. In February, 1872, he was called upon for a project for expending the balance of the appropriation "directly to the improvement of the natural channel of the river." He submitted a project for this purpose, which was approved and carried out during the season of 1872. In 1873 an appropriation of \$300,000 was made for the improvement of the Fox and Wisconsin rivers; in 1874 one of \$300,000, and in 1875 one of \$500,000, for the same purpose. In each of these years the projects for expenditure which were approved recommended the application of \$100,000 on the Wisconsin and the remainder on the Fox River.

Up to 1875 the work had been carried on with a view of confining the river to a single channel at low-water, and to reduce the width of the widest portions so as to get the river gradually under control and avoid violent disturbance of the bottom, which would result in case the channel were immediately contracted to the width finally necessary. In this way the work was distributed over a total length of river of 46 miles, in two sections :

- 1st. From Portage to Prairie du Sac; and,
- 2d. From Lone Rock to Boscobel.

Considerable dissatisfaction at the progress and plan of the improve-

ment was expressed about 1874, and in 1875 work was confined to short sections of the river in order to demonstrate practically as far as possible the success or non-success of the system.

Owing to insufficient funds to carry on both works of improvement that on the Wisconsin was suspended during 1876 and 1877. The total work done up to the close of 1875 was as follows:

150 dams, total length.....	65,971 feet
4 shore protections, total length .....	2,293 feet
1,215 snags removed.	
5,820 leaning trees felled.	
Total expenditures .....	\$337,065 27

In 1878 work was resumed on the upper section, and consisted principally in repairs of dams which had settled, and shore protection.

In 1879 several of the dams have been repaired and extended, and five new dams built in the vicinity of Prairie du Sac, at the lower end of the upper section.

The improvement to close of 1879 extends over about 50 miles of river, and consists of—

150 dams, total length.....	74,634 feet
6 shore protections, total length .....	5,714 feet
1,523 snags removed.	
7,332 leaning trees felled.	
Total expenditures .....	\$400,000 00

The question submitted to this board is set forth in the following extract from the letter of instructions of the Chief of Engineers (January 9, 1879) to the board on improvement of the low-water navigation of the Mississippi and Missouri rivers, to whom this subject was first assigned:

The act of July 7, 1870, contains the following: "*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:*

"That the Secretary of War is hereby authorized to adopt, for the improvement of the navigation of the Wisconsin River, such plan as may be recommended by the Chief of the Bureau of Engineers"; and with a view to determining upon a proper plan to be recommended for adoption, the question of improving the Wisconsin River is hereby assigned to the Board of Engineers on the low-water navigation of the Mississippi River.

It is desired that the board submit a report with plan of such improvement of the Wisconsin River as is contemplated in the above-mentioned act.

Having examined the Wisconsin River, September 19-22, from Portage City to Prairie du Chien, on the steamer Ellen Hardy, drawing 12 inches, and duly considered the results of the system of improvement as applied to this river for the past seven years, and discussed the special questions of slope and water supply in connection therewith, this board have the honor to submit their views upon the subject presented to them in the following report:

#### PRACTICAL EFFECTS OF THE IMPROVEMENTS.

To determine the practical effects exerted upon the river by the work of improvement already completed, we have the original survey made by General Warren from Portage to the mouth in 1867; the gauging made by him, reported on page 83 of his final report; and the table showing the duration of the different stages of the water surface for the years 1867, '68, and '69, on page 79 of the same report. To compare with these data which exhibit the condition of the river before any work was done upon it, we have a detailed survey made in 1878 by Colonel

Houston from Portage City to a point just below Dekorra (about 8 miles), covering a portion of the river where the works have been most systematically carried out; certain gaugings made by him in September and October, 1879; a table exhibiting the duration of the stages of the river at Portage for the years 1871 to 1878, inclusive; and a record of four lines of soundings made in the best channel below Portage, in the low-water stage of 1879.

A critical comparison has been made of these data by the board, with the following results for the section 8 miles below Portage. The information on hand is not sufficient to extend the discussion beyond these limits.

#### WIDTH FOR 8 MILES BELOW PORTAGE.

To determine this quantity for the unimproved river, distances of 1,500 feet were laid off on General Warren's map and the corresponding actual widths of the waterway at a stage 3.6 feet above the upper miter sill of the lock at Portage were measured. This miter sill is 3.05 feet below the zero of General Warren's gauge and 3.25 feet below the zero of the present gauge.

Twenty-eight widths were thus measured, giving a mean width of 687 feet, ranging from 1,200 feet to 430 feet.

Upon the corresponding map of Colonel Houston the widths between the ends of the spur jetties and the opposite shore were measured, giving 30 widths, of which the mean was 432 feet, ranging between 600 feet and 280 feet.

It therefore appears that the width at this stage (0.6 foot above the zero of General Warren's gauge) has been reduced from 687 feet to 432 feet—a diminution of 255 feet, or about 37 per cent.

#### MEAN DEPTH IN THE BEST CHANNEL FROM PORTAGE TO A POINT 8 MILES BELOW.

To compare this quantity, the line indicated by General Warren on his map was followed, and a mean of all the recorded soundings (138) was taken, giving 5.46 feet for a stage 0.6 foot above the zero of his gauge. Major Houston's map was then studied in the same manner, giving for the same stage (mean of 253 soundings) 6.51 feet.

Hence it appears that the best channel has deepened in this section of the river 1.05 feet at a stage 3.6 feet above the miter sill at Portage. Since, however, the whole regimen of the river has been changed, it does not follow that the same *volume of water* is passing now as in 1867 at a given reading of the gauge; and since this equality affords the only proper standard of comparison, the data was next studied to determine the fact.

#### VOLUME OF WATER.

General Warren gauged the river in this section four times in 1867 and once in 1878, using the method of mid-depth floats. Colonel Houston did the same eight times in 1879, adopting the same localities and the same plan. The following table exhibits these data:

*Gaugings of the Wisconsin near Portage.*

Locality.	Date.	Warren's gauge at Portage.	Number of floats.	Discharge in cubic feet per second.
Portage below bridge .....	Aug. 24, 1867	+ 0.6	11	186
Portage below canal .....	Aug. 24, 1867	+ 0.6	11	186
Do .....	Aug. 29, 1867	+ 0.55	11	183
Dekorra .....	Sept. 2, 1867	+ 0.5	11	180
Portage below bridge .....	Oct. 19, 1878	+ 2.85	11	201
Do .....	Sept. 25, 1879	- 0.2	11	167
Do .....	Sept. 26, 1879	- 0.3	6	158
Do .....	Oct. 6, 1879	+ 0.6	14	189
Portage below canal .....	Sept. 26, 1879	- 0.3	9	157
Do .....	Sept. 26, 1879	- 0.3	10	154
Below Baraboo River .....	Sept. 27, 1879	- 0.25	6	155
Dekorra .....	Sept. 28, 1879	- 0.2	9	150
Do .....	Oct. 7, 1879	+ 0.65	14	187

Throwing out of consideration for present purposes the measurement on October 19, 1878, the remainder are so nearly at the same stage as to render it admissible to assume for them that the change in volume per  $\frac{1}{10}$  foot of the gauge is uniformly the same amount, and hence to reduce the several discharges to the same absolute gauge reading for comparison.

What this amount is may be determined in various ways. Thus the gaugings of September 25 and 26, 1879, at Portage below the bridge show it to be 167 cubic feet.

In like manner the mean of the three gaugings at Portage on September 26, 1879, compared with that of October 6, 1879, shows it to be 189 cubic feet.

The gaugings of September 25, 1879, and October 6, 1879, at Portage indicate 201 cubic feet for this amount.

The gaugings of September 28, 1879, and October 7, 1879, indicate 127 cubic feet at Dekorra.

Adopting the mean of the three values of Portage (186 cubic feet) and of that at Dekorra (127 cubic feet), we have the grand mean, 157 cubic feet, as the average change in discharge due to a change of level of  $\frac{1}{10}$  foot in the low-water surface in this section of the river.

Applying this correction to the gaugings at Portage we find the following values for the discharge at zero of General Warren's gauge:

	In 1867.	In 1879.
Mean .....	2415	2431
	2210	2210
	2816	2816
	—	—
Mean .....	2481	2481
Mean .....		2481

It therefore appears that the change of regimen of the river has caused a volume greater by 460 cubic feet per second to pass at Portage, when General Warren's gauge reads zero, than was the case in 1867—i. e., the water plane is lowered 0.29 feet.

If the measurement on August 29, 1867, which General Warren states

'seems to be from 300 to 500 feet too large when compared with the others", be thrown out, the change in the water plane becomes 0.4 foot.

At Dekorra a similar discussion indicates 0.26 foot as the probable lowering of this plane.

Hence it appears probable that the river, at the same level about the low-water stage, in its improved condition, carries a *larger volume about 500 cubic feet per second) than before, the difference corresponding to about  $\frac{3}{16}$  foot in the reading on the gauge.* This result is in accord with experience upon the Garonne, where Baumgarten, reports that the effect of the improvements was first to raise and then to permanently lower the water level. If so, the increase in the mean depth in the best channel already deduced should be reduced by this amount, making it 0.75 foot for the volume which passed in 1867, when the water showed + 0.6 foot on General Warren's gauge.

DEPTHS ON THE CRESTS OF THE BARS.

For purposes of navigation it is not the mean depth in the best channel, but the depth on the bar crests, which is of practical importance. To compare the river in its two conditions, the surveys have therefore been examined in respect to this quantity. The following table exhibits the results when the *same volume* is passing at a stage corresponding to + 0.6 foot on General Warren's gauge.

Extreme low-water (1878) reads, — 0.6 foot on General Warren's gauge; hence 1.2 feet must be deducted from all the figures in the table to indicate approximately the depth on the bars in the lowest stage on record. For average low-water, 0.8 foot should be deducted.

Least depths on the bars for equal discharges.

Bars less than 3 feet.		Bars less than 4 feet.		Bars less than 5 feet.		Points where depth is greater than 12 feet.

					4.9		
					4.5		
					4.9		
					4.5		
					4.7		
					4.9		
					2.9		
					4.8		

A study of this table suggests several interesting conclusions:

1st. The worst bars (those less than 3 feet at this stage) exhibit no improvement. They are, however, now found at points where the river has not been sufficiently reduced in width, and by local jetties they could easily be removed.

2d. The bars with less than 4 feet have been reduced in number from 19 to 8, showing a decided improvement, and they are also much shorter than before.

3d. The bars having less than 5 feet of water have increased in number from 23 to 32, but the mean depth on their crests has also increased from 3.6 feet to 4.3 feet, showing an improvement of about 0.7 foot in average depth. This number, it will be noticed, accords almost exactly with the result reached by comparing the mean depths in the best channel and suggests the important conclusion that the average depth on the bars injurious to navigation has increased *pari passu* with the mean depth in the best channel.

4th. The effect of the improvements has been to increase the number and reduce the length of the bars, and to increase the number of holes (deeper than 12 feet).

The appended table\* (marked I) shows the results obtained in the past season (1879) by passing over the best channel in the improved portion, and recording the soundings taken at short intervals of time, the least depth on the bars being always given. The soundings are recorded as taken and the reductions to low-water may be inferred from the gauge readings at the heads of the columns, which refer to the present gauge (zero  $\frac{2}{10}$  foot above that of General Warren's.)

#### MOVEMENT OF THE BARS.

Colonel Houston has made some interesting measurements to determine the rate of movement of the bars down stream. He finds that a bar near the bridge above Portage, disconnected from the banks, traveled 940 feet in 24 days, or at a rate of 39 feet daily, at a stage + 1½ above General Warren's gauge at Portage; and 320 feet in 14 days, or at a rate of 22 feet daily, while the river was falling 1 foot. These rates for a bar connected with one bank were respectively 17 feet and 11 feet daily, at the same dates and locality.

#### DURATION OF STAGES.

The following table gives a condensed statement of the duration of the different stages of the river during the years 1871-'78. As compared with that on page 79 of General Warren's final report, it indicates that the conditions as to water supply are less favorable than would be supposed from the records at hand when the work of improvement was begun. Since that date very dry seasons have occurred, which, of course, must greatly reduce the volume of the river.

In addition to this natural cause, two or more dams have recently been built across the Upper Wisconsin by lumbermen to float their timber at low stages, which may temporarily affect the volume passing Portage City to a serious degree.

Another possible cause is the cutting of the timber on large areas of forest land in Northern Wisconsin; which, for small rivers, is well known to have a tendency to increase the heights of freshets, and correspondingly diminish the low-water level, and to decrease the duration of the flood stages and increase that of the low-water stages.

### SUMMARY.

In brief, the practical results of the improvements in the 8 miles considered seems to be—

1st. The width has been reduced about one-third, at the low-water stage.

2d. The average depth on the bars has been increased about 9 inches at this stage.

3d. The contraction in the width of the river has not been carried sufficiently far nor made with sufficient regularity to prevent the bars from occasionally rising to heights nearly as injurious to navigation as before the improvements were begun, but the number of such bars and their lengths have been materially reduced.

4th. The cost of effecting these results for the 8 miles below Portage has been about \$75,000.

### PERSONAL INSPECTION OF THE RIVER.

In addition to the foregoing means of information, the board made a personal inspection of the whole river below Portage in September, 1879, when the water stood +0.1 on General Warren's gauge at the canal lock. The boat employed (the Ellen Hardy) drew about 1.5 feet, and made the trip in four days, passing without difficulty over the improved and partially improved portions, and encountering the worst bars between Sauk City and Richland City, where no work had been done.

The mechanical details of the improvement have evidently received close study, and the work is prosecuted economically and rapidly.

The jetties exhibit a satisfactory degree of permanency—those constructed in 1872 being usually in a fair condition—even those not buried needing but little repairs to make them as good as new.

There seems to be no indication of any tendency to undermining; on the contrary, large bars usually form below the dams, and thus make new low-water banks, which serve to confine the water to a much narrower channel than before.

Except for the 8 miles below Portage, no data is at hand upon which to base any detailed estimate of the effect of the works of improvement upon the regimen of the river.

Seven bridges span the river below Portage, and all but two offer serious impediments to navigation.

## CONCLUSIONS.

The works for the improvement of the river, although ameliorating the navigable draught, wherever these have been applied, have not been sufficiently decisive in results to enable the board to recommend their application to the whole length of the channel without the aid of further information.

We think, therefore, that the section of the river already partially operated upon, from Portage for a length of about 12 miles, should receive additional wing-dams, and the width of the low-water channel should be contracted to 300 feet.

As this section has a slope exceeding somewhat the average, we think the results will be decisive, and if the channel be improved, for a reasonable amount, to an adequate depth, the application of the same system to the rest of the river could be confidently recommended.

While these works are under construction frequent gangings should be made to determine the volume passing through the channel at different stages, say at Portage, Dekorra, and Skinner's Bluffs.

Also frequent soundings in the deepest part of the channel should be made through the improved section with such angular measurements as will enable the track followed by the boat to be laid down in each case upon the map. These soundings should be referred to an absolute datum, by benches carefully established.

The estimated cost of the work now proposed is \$80,000.

The letter of Maj. D. C. Houston, of August 30, 1879, to the Chief of Engineers, inclosing copy of a letter from Mr. B. J. Stevens, which were referred to the board by your letter of September 5, 1879, are herewith returned.

Respectfully submitted.

L E T T E R

FROM

THE SECRETARY OF THE TREASURY,

TRANSMITTING

*Statement of emoluments and fees of customs officers during the fiscal year ended June 30, 1879.*

---

MARCH 3, 1880.—Referred to the Committee on Ways and Means and ordered to be printed.

---

TREASURY DEPARTMENT,  
*February 27, 1880.*

Hon. S. J. RANDALL,  
*Speaker House of Representatives:*

SIR: I have the honor to transmit herewith a statement of the official emoluments and fees received by customs officers during the fiscal year ending June 30, 1879, prepared in the office of the Commissioner of Customs, in accordance with section 2639 of the Revised Statutes.

Very respectfully,

JOHN SHERMAN,  
*Secretary.*

NOTE.—This statement is made from warrants paid by the Treasurer up to June 30, 1866. The outstanding warrants are then added, and the statement is by warrants issued from that date. The balance in the Treasury June 30, 1879, by this statement, is \$386,832,588.65, from which should be deducted the amount deposited with the States, \$28,101,644.91, leaving the net available balance June 30, 1879, \$358,730,943.74.

No. 4.—ANALYSIS of the PRINCIPAL of the PUBLIC DEBT of the UNITED STATES, from July 1, 1856, to July 1, 1879.

[Prepared in the Office of the Secretary of the Treasury.]

YEAR ENDED—	3 per cents.	4 per cents.	4½ per cents.	5 per cents.	6 per cents.	7 3-10 per cents.	Total interest-bearing debt.	Annual interest charge.

NOTE 1.—The annual-interest charge is computed upon the amount of outstanding principal at the close of the fiscal year, and is exclusive of interest charge on Pacific Railway bonds.

NOTE 2.—The statement of population for 1860 and 1870 is by enumeration, and for other years from estimates prepared by Mr. E. B. Elliott, of this department.

NOTE 3.—The figures for July 1, 1879, are made up assuming pending funding operations to have been completed. A slight revision of them may be necessary hereafter.

NOTE 4.—The temporary loan, per act of July 11, 1862, is included in the 4 per cents. from 1862 to 1868, inclusive, with the exception of the amount outstanding for August 31, 1865, this being the date at which the public debt reached its highest point. This loan bore interest from 4 per cent. to 6 per cent., and was redeemable on ten-days' notice after thirty days, but being constantly changing, it has been considered more equitable to include the whole amount outstanding as bearing 4 per cent. interest on an average for the year.

No. 5.—CHANGES IN THE PUBLIC DEBT OF THE UNITED STATES, ANNUAL INTEREST CHARGE, &c., from August 31, 1865, to January 1, 1880.

[Prepared in the office of the Secretary of the Treasury.]

REDUCTION OF INTEREST-BEARING DEBT.

REDUCTION OF TOTAL DEBT.

Total interest-bearing debt, highest point August 31, 1865 .....	\$2, 381, 530, 294 96	Debt, less cash in the Treasury, highest point August 31, 1865 .....	\$2, 756, 431, 571 43
Total interest-bearing debt January 1, 1880 .....	1, 786, 686, 850 00	Debt, less cash in Treasury, January 1, 1880 .....	2, 011, 798, 504 87

Consols of 1867 .....	6	5, 801, 050		810, 622, 760	316, 423, 800		
Consols of 1868 .....	6	203, 250		37, 473, 800	37, 677, 050		
Total .....		\$13, 957, 000	\$697, 850	\$447, 845, 990	\$1, 305, 345, 000	\$1, 305, 345 00	

In place of the above bonds there have been issued bonds bearing interest as follows:

TITLE OF LOAN.	Rate per cent.	From January 1, 1870, to March 1, 1877.	Annual inter- est charge.	Since March 1, 1877.	Annual inter- est charge.	Total issued.	Annual inter- est charge.
Funded loan of 1881 .....	5	\$500,000,000	\$25,000,000	.....	.....	\$500,000,000	\$25,000,000
Funded loan of 1891 .....	4½	50,000,000	2,250,000	\$135,000,000	\$6,075,000	185,000,000	8,325,000
Funded loan of 1907, including refunding certificates .....	4	.....	.....	710,345,950	28,413,838	710,345,950	28,413,838
Total .....	.....	550,000,000	27,250,000	845,345,950	34,488,838	1,395,345,950	61,738,838

Making an annual saving of interest hereafter of \$19,900,846.50, of which amount \$14,290,416.50 arises from transactions since March 1, 1877.

BONDS SOLD FOR RESUMPTION PURPOSES.

Bonds have been sold for resumption purposes since March 1, 1877, the interest on which represents the annual cost of the coin reserve as follows:

TITLE OF LOAN.	Rate per cent.	Amount.	Annual inter- est charge.
Funded loan of 1891 .....	4½	\$65,000,000	\$2,925,000
Funded loan of 1907 .....	4	25,000,000	1,000,000
Total .....	.....	90,000,000	3,925,000

Making a net annual saving in interest through the refunding and resumption operations since March 1, 1877, of \$10,365,416.50.

In addition to the above bonds, there were issued in 1878, to replace coin used in payment of the Halifax Award, four per cent. bonds of 1907, amounting to \$5,500,000.

No. 6.—RATES at which UNITED STATES LOANS were placed on the market, together with the CALCULATED RATES of INTEREST REALIZED to INVESTORS, at different periods, from 1796 to 1861, inclusive.

*a* In the column of "Production," the amount placed opposite the fiscal year is the production of the preceding calendar year. For example: The quantity stated in the column of "Production" opposite the year 1878 is the production of the calendar year 1877, since the exports of wheat and of corn during the year 1878, were principally of the respective crops of the calendar year 1877.

The production of both wheat and corn during the year 1869 is taken from the census report of the succeeding year. The production for the other years is taken from the annual reports of the Statistician of the Department of Agriculture.

a No data.

NOTE.—The production of sugar and molasses in Louisiana is stated upon the authority of M. Champonier for the period prior to 1861, and for the later years upon the authority of M. L. Bouchereau. These authorities give both the number of hogsheads and the number of pounds for each year, with the exception of the year 1861-'62, for which year only the number of hogsheads is given. The number of pounds of sugar produced during that year has, however, been computed by estimating the weight of the hogshead at 1,150 pounds.

<sup>a</sup> Prior to the year 1864 the tonnage of British Columbia is combined with that of the British Possessions on the Atlantic; subsequent to that period they are shown in a separate column.

<sup>b</sup> A small portion of the tonnage from the United Kingdom during these years entered at lake ports, and has been deducted from the total tonnage entered from that country, which will account for the apparent discrepancy between these figures and those of the regular annual statements of navigation.

<sup>c</sup> No detailed statement of the trade of each port with foreign countries was published for these years, which renders it impossible to determine what amount of the tonnage of each foreign country, if any, may have entered at lake ports. The whole amount of tonnage from the countries herein enumerated has therefore been credited to seaports.

a No detailed statement of the trade of each port with foreign countries was published for these years, which renders it impossible to determine what amount of the tonnage of each foreign country, if any, may have entered at lake ports. The whole amount of tonnage from the countries here in a summarized form therefore been credited to Liverpool.

1878.....	429,200,000	580,000	25,752,000	6	740	44 40

*a* This statement is the result of original estimates, made by Mr. J. R. Dodge, from annual returns to the Department of Agriculture, of the comparative condition and area of the crop and price of product; and as to quantity of production, mainly from the official records of manufacture and exportation. It has been demonstrated that returns of production of tobacco, which bears a heavy tax, are uniformly under-estimated, whether census returns or those of the Department of Agriculture: a fact in accord with the experience of all governments with respect to voluntary statistical returns of taxed products. The prices are the average home or farm value of leaf tobacco.

*a* The statistics for 1869 are derived from the United States Census. The statistics for 1876, 1877, 1878, and 1879 are compiled from data collected and estimates made by Mr. Frederick E. Seward, editor of the Coal Trade Journal of New York.  
*b* Includes 2,000,000 tons estimated as the local consumption. The amount given as the production of anthracite coal for 1879 does not include this estimate but represents the actual shipments to market.

**No. 152.—ESTIMATED PRODUCTION, AREA, and VALUE of the TOBACCO CROP of the UNITED STATES, from 1868 to 1878, inclusive. *a***

YEAR.	Product.	Area.	Values.	Value per pound.	Yield per acre.	Value per acre.
	<i>Pounds.</i>	<i>Acres.</i>	<i>Dollars.</i>	<i>Cents.</i>	<i>Pounds.</i>	<i>Dollars.</i>
1868.....	402, 000, 000	536, 000	42, 612, 000	10. 6	750	79 50
1869.....	383, 000, 000	604, 000	41, 265, 000	10. 5	651	68 32
1870.....	385, 000, 000	575, 000	38, 500, 000	10	669	66 90
1871.....	426, 000, 000	580, 000	41, 748, 000	9. 8	734	71 96
1872.....	480, 000, 000	584, 600	49, 920, 000	10. 4	821	85 39
1873.....	506, 000, 000	633, 000	41, 998, 000	8. 3	775	64 32
1874.....	315, 000, 000	500, 000	34, 650, 000	11	630	69 30
1875.....	522, 000, 000	710, 000	41, 760, 000	8	735	58 81
1876.....	535, 000, 000	733, 900	39, 590, 000	7. 4	730	54 01
1877.....	580, 000, 000	745, 000	40, 600, 000	7	778	54 49
1878.....	429, 200, 000	580, 000	25, 752, 000	6	740	44 40

*a* This statement is the result of original estimates, made by Mr. J. R. Dodge, from annual returns to the Department of Agriculture, of the comparative condition and area of the crop and price of product; and as to quantity of production, mainly from the official records of manufacture and exportation. It has been demonstrated that returns of production of tobacco, which bears a heavy tax, are uniformly under-estimates, whether census returns or those of the Department of Agriculture; a fact in accord with the experience of all governments with respect to voluntary statistical returns of taxed products. The prices are the average home or farm value of leaf tobacco.

**No. 153.—QUANTITY of COAL PRODUCED in each STATE and TERRITORY of the UNITED STATES, during the Calendar Years 1869, 1876, 1877, 1878, and 1879.**

[Weight expressed in tons of 2,240 pounds.]

*a* The statistics for 1869 are derived from the United States Census. The statistics for 1876, 1877, 1878, and 1879 are compiled from data collected and estimates made by Mr. Frederick E. Saward, editor of the Coal Trade Journal of New York.

*b* Includes 3,000,000 tons estimated as the local consumption. The amount given as the production of anthracite coal for 1879 does not include this estimate, but represents the actual shipments to market.
